"In this country flooring of this kind, from 23 to 25 millimetres (0.905 to 0.984 inch) thick, costs 7.50 marks per square metre laid. As magnesium chloride is hygroscopic, these floors may become damp if the proportions of the composition are not carefully determined upon, and the salts thereby precipitated are injurious to wood and iron. Every manufacturer has his own recipe, and undertakes, naturally, to overcome this quality of the principal raw material. The cheaper grades of flooring are colored to resemble linoleum or mosaic pavements, and, in many instances, have given entire satisfaction during a considerable term of years. The emigrant halls of the Hamburg-American Line in this city are paved almost entirely with this composition. Floors thus made are more elastic than cement floors, are much warmer, and preserve a smoother surface. Under the fire test this flooring chars, but does not burn, and is a poor conductor of heat.

"Manufacturers of the artificial wood plates use cork waste as well as sawdust, and produce an infinite variety of building materials, including flooring, wainscoting, and roofing plates. One well-known maker supplies a stair covering in one color at 3.50 marks per square metre (83.3 cents per 1.196 square yards) laid, or in several colors at from 5 to 7 marks per square metre ($1.19 to $1.666 per 1.196 square yards). The same manufacturer lays a cheaper flooring intended to be covered afterwards with linoleum or parquet flooring at 1.60 to 3.50 marks per square metre (38 to 83.3 cents per 1.196 square yards).

"Still another manufacturer supplies flooring meal to be used according to his formula at 7.9 and 12 marks per 100 kilos ($1.666, $2.142, and $2.856 per 220 lbs.), according to the quality and purpose for which it is intended."

U. S. Forestry Practice

About 75,000 acres of cutover and partly logged land has been examined by the United States Forest Service to find out the quantity of timber available in the White Mountain region. Most of the tracts average $3 an acre, being badly cut over and in several localities damaged by fire.

The tracts of land that are important as watersheds and are therefore sought by the government are held by a few large pulp and lumber companies. Spruce has been logged extensively over the entire White Mountain region, and while there still remains a few bodies of virgin spruce, the government is not eager to buy them until they have been logged, partly on account of the high cost involved and partly because it is more important at the present time to buy up the cutover lands which allow erosive action greater play.

The cost of logging the high slopes and a few low mountain tops has left large quantities of old, stunted tree growth uncut. This alpine growth is for sale at very low prices and is of very little commercial value to either its past owners or Uncle Sam, yet the Forest Service attaches a very value to it as a protection of the soil from erosion.

With regard to the application of forestry to the White Mountain area, the first step is the replacement of the growing stock on two large areas that were fireswept after cutting a few years ago. The erosion in these places is something appalling, and the growth on the bare soil now left must come by artificial planting.

Tracts of timber which are now overmature and already on the road to decay will be cut and sold to the highest bidder under the adoption of cutting rules and certain methods of disposing of the slash. The timber-selling policy will be based upon regular principles of business and where timber can not be harvested at a profit it will not be offered for sale until it can be made to yield a fair profit.

Natural reproduction will be relied upon to restock most cutover lands because the cost of planting, except in the cases of very bad burns and erosion, is too high.

The chief aim in the administration of the White Mountains will be to maintain a regular and permanent supply of timber, together with the proper storage of rain water on the watersheds.

Of additional importance is the perfection of a system of fire protection. To bring this about, trails, telephones, fire lines and organized patrol will be established. More efficient uses of instruments like the telegraph, heliograph and colored lights at night, will be studied in the effort to secure absolute fire protection.

American Hickory Waste

It is conceded by the American Forest Service hickory associations and the general mass of consumers of this wood, that not more than ten per cent. of the forest stand comes into eventual utilization in wagon woodwork, handles, dowels, and the other purposes for which it is employed. In many other woods, 30, 40, and even 60 per cent. of the forest growth is utilized. The explanation of the tremendous waste in hickory is easy. In the utilization of this wood none but the clear is employed. It would be impracticable to utilize knotty or otherwise defective hickory in wagon spokes, felloes, handles, or in any other place where the wood is generally used. Hence it is a clear lumber "proposition." If only clear oak were employed in the utilisation of this wood, it is doubtful if the percentage of utilization would be much greater than that of hickory, although oak is a much sounder wood than hickory. On the whole American hickory is a growth showing many defects. A good deal of the present stand is hypermature and therefore is brash and unfit for the purposes for which the wood is used. Several varieties are deficient in elasticity, resistence and strength, and hence usually are not taken out of the forest at all. There are only comparatively few varieties of hickory that are of essential value where toughness and elasticity are demanded. It is only of a comparatively recent date that the red or heartwood of the hickory has been used. Formerly it was only the sap of young or second growth hickory which had been utilized. Now the specifications for carriage woodwork and handle material admit the heartwood if it is of equal weight to the sap wood. This plan will doubtless help hickory utilization up to well towards 15 per cent. of the total forest production.

Review of Current Trade Conditions

Ontario

In the cities throughout the province, and in the majority of towns, the lumber trade at the present time is fairly brisk, and shows signs of continuation with little or no heed of the impending reciprocity developments. In country districts also trade conditions are improved, and with the harvest work at an end, or nearly so, the farmers are using considerable quantities of pine and spruce upon improvements, which will occupy a portion of their time in the fall months. In some parts of the province the crop returns were not by any means up to the mark this year, with the result that there is not a general building of extension that might have been expected.

At the present time lath is said to be in good demand generally throughout the province and especially in the cities, where a great number of residential buildings have recently been closed in. Shingles are moving at a fair rate, although their demand for this season has entered upon its decline. The prices of lumber are remaining firm and in the majority of districts the business diversion caused by preparation for the coming elections has but little effect and the prospect of the larger market has not as yet made itself evident to any appreciable extent.

Eastern Canada

The continued activity in building circles in Montreal and eastern cities has kept prices in the lumber trade very much on a level with those previously reported. They are firm and there are no indications of any depression as yet, since the demand for lumber still keeps up. Pending a decision regarding reciprocity the export trade with the Eastern States is not so brisk, as firms are waiting until the acceptance or rejection of the pact has become decided. In some parts of Quebec and in the Eastern States manufacturing has been impeded owing to scarcity of water power which frequently presents itself at this time of year.

In northern pine the volume of trade has been fair and a better outlook prevails for the near future. Southern pine has also prospects for a better buying situation, considerable optimism being expressed for fall business. At the present time there is very little buying ahead and competition is fairly keen for all business that offers itself. The tone of the eastern spruce market as reported in Boston is a little firmer, orders for prompt shipment bringing $24, while the general price is $23.50. Spruce covering boards are also in moderate call, although prices are stated to be a little firmer. An investigation of a number of deals goes to show that there is but little increase over last report. There is a rather small demand for hemlock and prices show no change, although the market is attaining a better basis and it is expected that fall trade will develop accordingly. Shingles have been in good demand, the best cedar extras ranging from $3.40 to $3.50. Lath are firmer and a better demand is reported, the Boston markets showing $3.80 for the better grades of 1⅝-in. lath. At New York the hardwood trade has improved decidedly and a better volume of business has resulted, while prices are being well maintained. Maple and ash are strong, there being an excellent call for maple flooring. Chestnut, beech and birch are all in good demand and moving well. The outlook for the fall trade improves from week to week.

Great Britain

Despite the recent labor troubles which caused such a disturbance in trade circles throughout the country great optimism exists with regard to the prospects for future business. Never in the history of the timber trade in the principal cities of England has it experienced such a state of chaos. In Liverpool every timber yard was obliged to close its gates as the railways had suspended operations and could not receive goods for shipment, while the steamship owners after they had already made all the concessions demanded by their employees were obliged to stop their steamers, owing to the great influx of petty and sectional demands, until a solid basis could be arrived at. Notable among the disastrous effects of this suspension was the interruption of Atlantic traffic in timber goods. The "Megantic" was obliged to retrace her course to Montreal with her consignments of pine on board, and other liners with numerous pine and spruce deals were likewise hung up.

The market quotations for spruce and the majority of other materials are in a desultory condition, the demand being exceedingly small and sales difficult to make. The lower grades of lumber are poorly supported and stocks are more than sufficient for present demands. The birch market continues to be fairly firm, however. Planks are also in fair demand, although consumers are not buying large quantities as prices are on a rather high level.

In Manchester the trade also suffered a serious disturbance and business was practically suspended. The handicap caused by shortage of trucks, barges and flats extended throughout nearly two weeks. Prices remained fairly steady, however, and numerous enquiries were presented for spruce and pine deals.

Due to troubles in Norway, floorings are rather scarce and prices are on the increase. Spruce deals are rapidly finding their way into the town yards, and, speaking generally, the volume of trade is reviving quickly after its serious handicap.

At London, owing to the extraordinary dearth of business during the strike, delivery work was slow in being again resumed, the outlook having been anything but bright. It was impossible to get any goods from the docks, all trades having use for wood being at a standstill. Sawmills and yards have resumed work, however, and although considerable confusion was in evidence, the prospects appear bright for the remainder of the season for demand of building materials. In addition to the disorganization of current business already referred to, the trade has been obliged still further to face the impost levied by the London Port Authority. Although the increase was light the already existing charges were heavy, and taken as a whole, it is reported as being likely to add materially to the serious handicap under which the expansion of the import trade of London is hindered. The report continues to say that in the lumber branch of the hardwood trade this increase of rates will stimulate the practice which has gained extensively of late of taking goods ex-ship, and storing them away from docks in or at the numerous warehouses and wharves which are so readily available in convenient districts. During the month of August a fair supply of mahogany was received, as well as the first installment for the season of Honduras and Tabasco wood, but owing to the existing labor conditions, sales have been few as yet.

United States

The indications for a somewhat active demand of lumber continue in their brightness, although buying for the retail yards and industrial consumers is still mainly for immediate needs. Even this volume, however, is on the increase, indicating that existing stocks have been substantially reduced and that replenishment is necessary. It is expected that considerable activity in buying will be experienced in the fall trade, for the reason that the general dullness throughout the summer has greatly diminished the stocks. Owing to a car shortage which has the undesirable prospect of some duration, deliveries are slow and uncertain. This shortage is being felt in several districts, especially in the southwest, where a large cotton crop, together with heavy grain shipments, live stock, fruit, corn and other farm products are in transit. On account of labor troubles a number of the larger mills in Louisiana and Texas have been shut down, some of them for weeks, with no prospect of an early resumption of business. As a result prices in the south have stiffened and northern dealers have begun to place orders previous to the general advance taking place.

There is a pronounced improvement in the demand for hardwood lumber in Tennessee and along the Ohio River, orders coming in from all sections. Many carload shipments have been made, the demand being for the better grades of hardwood, for which the prices are very firm. In New York trade is showing better and dealers are expecting a substantial increase in volume for the fall.

Chicago.—The demand for lumber generally is on the increase. Pine is moving as well as can be expected at this season, and in comparison with a year ago, conditions are greatly improved. A renewal of activity is expected in white cedar now that harvesting is over, and labor is more available for repair and extension work. Enquiries have been increasing fast recently. An increase in the movement of northern hemlock is also noted, and manufacturers feel confident that they will have a good fall trade, prices being stronger and competition a little less keen. Western products, such as fir, spruce, cedar and western pine, are strengthening in demand, although prices have not advanced as yet. Spruce is steady, their being a fair demand for B siding, the holdings of which are limited to a moderate supply. Fir flooring is more active and the railways are buying large quantities of fir for repair purposes. The demand for shingles remains unsettled, the prices being much the same as previously quoted. There is no appreciable change in the prices or demand for lath. Among the hardwoods there is a steady upward movement and Chicago yards report a fair volume of orders, the upper grades of plain red oak being in good demand. Maple is also in fair request.

Buffalo.—The trade remains quiet, little improvement being in evidence over last report. Long-leaf southern pine has not as brisk

a demand as was anticipated for this time of the year, although prices remain practically the same without any indication of weakness. Not much improvement is looked for in short leaf stock as the building trade has not shown signs of renewal of activity. Orders for fir, spruce and cedar have been few of late, although some yards have been moving a fair amount of stock. When the railroads begin their purchases in these classes of lumber, things will look much brighter, since of late this market has been doing very little. There is a rather small demand for hemlock as the local building trade has not been active in the classes of structures calling for its use. The railway shipments of this commodity from Pennsylvania have been keeping fairly steady and advices show little change. Trade likewise continues light in hardwoods. There have been numerous orders for small lots, among which might be mentioned plain oak, maple and birch. Prices are holding up firmly and the better grades are still scarce. Chestnut is in fair demand and there is a moderately good call for elm and basswood. In northern pine some dealers are finding trade considerably better than they had anticipated. Ont of town demand is said to be better than local, owing to the fact of the strike. This, however, will only have a temporary effect. The box factories are fairly busy and a large amount of box lumber is on the move.

Bay City and Saginaw.—Lumber is coming in by water freely, and dealers say that business is holding its own with a perceptible increase in orders during the last few weeks. The market for northern pine appears to be unchanged. Prices for commodities generally, are also firm and distribution by rail is fair for this season of the year. Dealers are well supplied with stocks to handle their trade. The box trade has been slightly under normal of late, but the plants are kept running and at the present time a number of contracts are being closed.

Market Correspondence

Good Trade at Montreal

Montreal, September 9, 1911.—There is no slackening in the local demand for lumber, owing to the continued activity in the building trade. Prices under these circumstances keep firm, and all indications point to the present level being maintained for some time. So far, electioneering has not interfered with the local business, and is not likely to do so. Dry pine is again in request, but the supply is limited. Firms who do an export trade with the United States complain that reciprocity is interfering with the demand. Buyers naturally are holding their hands until the electors decide whether they will accept or reject the agreement. Business is therefore slow, and those dealers who are opposed to the pact are inclined to express their opinions in decidedly frank terms.

"Prices limited and supplies unlimited," was the statement of the partner in a firm dealing in dimension timber. There is practically nothing doing in this section, he declared, and prices are being cut to ribbons.

The demand for pulp is greater than the supply, owing to the enormous call from the United States; most mills have sold up to the first of July. One firm has completed, within three weeks, sales for 5,000 tons. Of course, prices have gone ahead, and are now very high.

Reports from all over the province of Quebec show that water at the mills is very low, which, of course, effects the power. The same conditions obtain in parts of the United States, and is the chief reason for the demand upon Canadian mills. Ten thousand tons of Swedish pulp have been imported into Maine in order to supply the shortage. There is a considerable quantity of news print accumulated in the United States, but no surplus on this side.

Although the strikes in England are settled, the effects have by no means passed away. The shipping schedule was completely upset, and in consequence the harbor has been, for the time being, almost deserted. Much lumber is awaiting shipment, the vessels not having arrived to take the cargoes. To illustrate the complete disorganization at Liverpool, it may be stated that the Laurentic and Virginian, which discharged at Quebec, instead of coming on to Montreal, brought back a considerable quantity of lumber which the vessels took from Canada and were unable to land at the British port. At present the demand from Great Britain is quiet.

The Lumber Trade in the United Kingdom

Liverpool, Sept. 4.—The timber trade at London, Liverpool and Manchester has just passed through a time of compulsory holiday. Business has been at a standstill for some days. Yards have been closed. Doors and gates have been securely barred and bolted. Carts and wagons have been in shed or in yard, horseless, and an air has prevailed similar to that which prevails on Sunday or on a bank holiday. At the offices, managers and clerks have been in attendance, but it has been a sort of "stand-by" attendance. The reading of the day's newspapers and the discussing of events recorded in them, have formed the principal occupations of office staffs for fully a week past.

The meaning of this unusual state of things is, that trades like the timber trade, which do business in bulky goods, have been pretty much at a standstill for nearly a fortnight owing to strikes of railway and dock workers. On August 18 a general strike of railway workers was called for, but at the time the dislocation of railway goods traffic was nearly as complete as it could be. On dock quays stocks of timber lay where they had been dumped down when delivered from steamers which brought them. In the dock yards stocks stood untouched. The regular workers were not visible, so that there was no one to handle the timber and if there had been it could not have been taken farther than the railway station-yard or depot owing to the stoppage of goods trains or the absence of the men who usually load the trucks. At timber merchants' offices, accordingly, principals and managers came to the conclusion that the only thing they could do, other than shutting up altogether and going home, was to accept the situation as philosophically as might be, and to stand by and await developments. It was rightly concluded that the suspension of dock and railway traffic could not continue for many days, so that the wisest course was to wait until the wind changed and then go on again. This course was adopted. Principals, managers and clerks simply stood by and awaited. On August 21 the railway strike was officially announced to be at an end but the strike of dock workers at Liverpool continued. At London, timber began to move again but very little could be done owing to the glut of goods at railway depots and stations which had to be dealt with before more goods could be received for forwarding. At last timber got its turn with other goods and a movement of timber from quays to yards and from yards to railway stations began. At the time of writing the movement is not nearly normal, but the trade are glad that a start has been made and that there is a likelihood of things becoming normal within a couple of weeks. It will require nearly two weeks for the accumulated stocks to be sent to their destinations and for the different roads to be fully opened and made clear again for traffic at its full volume.

Different branches of the wood-working trades have suffered from the strike epidemic. In London, box and case makers thought the time opportune to strike for higher wages. Messrs. C. H. Glover & Co., Ltd., Prince Savage; Lloyd and Steel, have agreed to advance the wages or earnings of employees by sums ranging from 1s. to 6s. per week. A strike of fortnight's duration was brought to a close by employers agreeing to give their workers advances coming within this range. In some cases an advance of 4s. per week was made in the wages of girl workers, while to the more skilled men workers an advance of 6s per week has been given. At Liverpool and at Birkenhead, cabinet makers, chair-makers, French-polishers and upholsterers have made demands for a revision of the scales of payment, or for a recognition of shops as society shops, and some hands have struck work and turned out. Concessions have been made but some points are still matters of conference between employers and their work-people. To add to the difficulties of the general trade situation the Port of London Authority has practically joined the strikers. It has struck for an advance of 7½ per cent. on the rates, dues, rents, charges and tolls of port and river ;as in operation prior to August 13th. The "Authority" has of course been spared the humiliation of "downing tools," locking up and saying "We'll do no more unless we get the 7½ per cent. increase," as the workers of an ordinary trade would have done. It was in a position to say that as from the 14th of August the rates, tolls and dues would be increased by 7½ per cent. "pending the revision in detail of the several rate books and tariffs." The reason assigned by the "Authority" for this advance was significant. It was that:—"In consequence of the additional expense incurred by the recent increase in wages, all the existing dues, rates will, as from th 14th inst. be increased by 7½ per cent. pending the revision, etc." This increase in rates is of importance to timber shippers and merchants and already they are considering how the new change can be made to bear least heavily upon them. A way which promises relief is for the delivery of timber to be taken ex-ship, and for the goods to be carried by lighter or otherwise to warehouses or yards instead of the vessels entering dock, and the timber being kept for a time on dock quays or even being passed over the quays. It is believed that with the increased rate in force much timber will be handled in this way.

Bent Timber Trade Association

Further evidence of the unrest which exists at present in the timber trade of the United Kingdom has been seen in the formation

Importers, Manufacturers and Wholesale Grocers

of a bent timber manufacturers' association. This new organization has been formed with the open and avowed intentions of trying to keep prices up and to prevent the keen cutting which has proved so great a bane to bent timber manufacturers of late. For the present the new association will devote itself especially to the scope and requirements of the coach building and the new motor building industries. It is commonly supposed that the great development of motoring within the last seven years has practically destroyed the old, coach-building trade. This is an entire misconception. There has certainly been a falling off in the number of horse-carriages used, and the number of such carriages now being built is small. But a very large number of motor cars and cabs with "coach bodies" have been built and are still being built. The change has been one from horse-coaches to motor-coaches. The petrol-driven motor vehicles have as truly coach-bodies as the old broughams and stage coaches had. The bodies of the motor vehicles differ in form from those of the older horse vehicles. Many of them are larger, stronger and more elaborate than the bodies of the old horse vehicles, so that as regards the change from the old to the new, it has been a change of mode rather than of genus or kind. Wood is wanted for the new motor-coach bodies as it was wanted for the bodies of the horse-vehicles. The chassis of a motor coach will be of steel, the coach-body proper; will be framed chiefly of hardwood. The coach-building industry in its two-part whole; the horse-vehicle branch and the motor-vehicle branch still exists and in an enlarged form and makes its demand for hardwood and especially for bentwood.

This does not by any means represent the full extent of the coach-building industry of the United Kingdom at the present time. Another and a more extensive coach building industry has come into existence within the last dozen years. This is the tramway car building industry, an industry that has attained an extent and an elaborateness which, for the short time, are simply marvellous. In constructing an up-to-date tramway car a relatively large quantity of hardwood is used. The frame will be of selected ash, much of the wood being bent. The seats, if of wood, and the seats of such cars in England are as often of wood as not, will be of bent wood, birch, sycamore or some other white wood, the frames of course being of ash. Oak is freely used for special parts and fittings, while mahogany is at times used for fittings to give an air of variety. The main timbers of this new coach-building industry are of ash and oak and a vast amount of each of these woods has been used since the building of tram-cars for the new electric-car services began. The industry gives every promise of being a permanent one and of continuing to make its demand for wood of the kinds named. It is true the building of tramway cars can not go on at the rate at which it went on from six to twelve years ago. The rate of building then was feverish and abnormal. Now the industry stands at ordinary limits and makes a regular demand for hardwoods and other materials. As far as can be foreseen this demand will be steadily maintained and will increase rather than become less.

The Furniture Man and His Veneer

The furniture man's veneer is one thing and often his plain veneer, fillers and backs are another, and some of the well posted panel manufacturers claim that it is economy to buy them from different sources, says Hardwood Record. However that may be, a different consideration enters into the subject when a man is buying veneer for what might be termed a structural purpose, for utility rather than for its face appearance. The furniture man has a very good instance of this in drawer bottoms, which are not decorative in any sense of the word. Therefore, veneer for this purpose should be bought with a view to its adaptability to the purpose.

Veneer drawer bottoms come in three forms: the single-ply rotary cut veneer, the two-ply built-up veneer, and the three-ply built-up veneer. We may even add another form and say that they come in the form of straight resawed lumber.

In the earlier days of veneering quite a number of drawer bottoms, backs and interior thin stock was made with veneer saws from flitches of cottonwood, poplar and gum. It was an excellent product, but it is too expensive as compared with rotary cut veneer. The best drawer bottom is one made of three-ply veneer glued together, but the cheapest, of course, is single-ply. There is really not much excuse for two-ply stock, because it is not well balanced. It is better, of course, than single-ply, but it would be only a little more expensive to make it three-ply and give the greatest strength in a drawer bottom. Furniture men will do well to give special attention to quality in drawer bottoms, even in cheap furniture. It is worth while. It makes an excellent talking point which should enable the salesmen to get more for the additional cost of making three-ply drawer bottoms as compared with single-ply. Some furniture men may want to make these themselves, while others who buy them from manufacturers may be able to arrange to get three-ply drawer bottoms cut to size.

In the woods used for drawer bottoms gum has the lead, and will probably hold it. However, beech has come in quite extensively and is claimed to make an excellent drawer bottom, either in single-ply or in built-up stock. Beech at present is receiving much more attention than formerly in the veneer and basket industry. The basket factories in the beech territory use a considerable amount of it and often it may be practical to get beech drawer bottom stock from basket factories and others cutting common veneer, at an inviting price and thus secure a good bottom without adding too much to the material cost.

It is predicted that the next few years will see a number of the woods enter into the manufacture of drawer bottoms, among them being yellow pine from the South, especially for single-ply. Yellow pine veneer is very conspicuous in box making, and is one of the cheapest veneer products made. Therefore, it may find its way up from the South into the furniture factory trade. Spruce and fir from the West will also probably work their way over.

It is often worth while for the manufacturer to seek for a combination of veneer, lumber and crating stock in his shipments. Ask the veneer men you are figuring with whether or not they make lumber, furniture dimension, or could supply crating material made from their cores and rough blocks. And here and there it should be possible to develop a connection in which, by combining in the same car shipments of veneer, furniture dimension, and even furniture lumber, one could get a carload combination easier than any other way and thus effect a saving in freight which would be worth while.

Another thing which should be considered in connection with veneers, and which has probably been mentioned before, is the condition of the stock—not merely its condition as to dryness or defects, but the physical condition after drying. One should be careful to see if it is hard, harsh and wrinkly, or whether it is soft and flat.

Thin veneer is inclined to wrinkle more or less, no matter how carefully it is dried. Thick veneer, sometimes because of the nature of the wood, will wrinkle also, and perhaps needs a little moistening and re-drying to flatten it out. However, most of the trouble in wrinkling may be traced directly to the process of drying. It has been dried too rapidly, handled carelessly, or improperly piled.

Often the handling of stock in drying and piling is nearly equally as important as proper cutting. In fact, the matter of handling and drying is so important that perhaps the best plan of all, where a furniture man uses enough to justify, is to buy the veneer dried on one of the modern dryers, but care should be taken not to get it too dry. It should be dry enough to prevent sap stain and things of that kind when bulked, but all the moisture does not have to be removed. If the stock is in good bulking shape, is piled in the warehouse until ready for use, and then properly run through the re-dryer, one can be pretty sure of getting veneer in the best possible shape.

For bulking it is perhaps better that the veneer should not be too dry. The dryness itself does not affect the stock, but in the process of getting it too dry, the man at the dryer is likely to make it harsh and cause wrinkles and then if it is piled in bulk and weighted in drying out, it is likely to check and split badly. If enough moisture were left in it to make it pliant, it would straighten down and dry much better when it is piled in the warehouse.

In order to be on the safe side, it is necessary to re-dry veneer stock before using, regardless of how dry it was when received and piled in the warehouse. Therefore, any additional moisture in veneer which has been kept in a good shape can be disposed of in a re-dryer, or by keeping the stock in a hot room for a short time or a dry-kiln just before using.

According to a recent report in the Toronto Globe, Mr. Chester W. Lyman, of the International Company, anticipates that there will be an immediate and large increase in the manufacture of paper and pulpwood in Canada for export to the United States, as a result of the tariff changes affecting these commodities.

Mr. Lyman stated that the present exports of pulp and paper amounting last year to about 60,000 tons will probably be more than trebled within the next six months. The Canadian manufacturers will largely increase their purchases of pulpwood from private holders of pulpwood lands, principally in Ontario but to some degree also in Quebec and New Brunswick.

The recent fires in Newfoundland have destroyed upwards of $2,000,000 worth of pulpwood, standing and stacked, besides many thousands of mill logs and railway ties. The full extent of the damage has not been ascertained as yet.

More Power Means

More Profit

USE "AMPHIBIA" BELTS

¶ Anything making for more power or less friction is of much interest to all belt users.

¶ To get the most possible power, speed and economy from belts is a problem we have studied for thirty years, and now we produce a practically perfect belt.

¶ "Amphibia" Belts will do more than just ordinary belts and with less cost for up-keep.

There is an "Amphibia" belt for every purpose.

¶ "Amphibia" Belts are waterproof. They are not affected by steam, water, damp air or any similar adverse conditions. We guarantee them against opening of laps through exposure to water or steam.

Your Chance to Prove "Amphibia" Efficiency

¶ If you are contemplating the installation of any transmission equipment let us advise you more fully as to the efficiency of "Amphibia" Belts.

¶ Send us your enquiries. We can be of help to you. We agree that you first prove "Amphibia" merit before any cost to you.

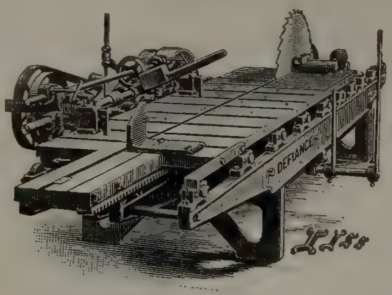
An Attractive Bolting Machine

The Defiance Machine Works of Defiance, Ohio, show a very interesting machine in their No 6 Bolting Saw. Combined in this machine is the equipment for over a dozen wood specialties such as hubs, spokes, insulator pins, etc.

The frame of iron throughout is heavy and substantial to withstand the rapid and heavy labor expected of it.

The patent gauge is instantly adjustable for ripping material to different thicknesses. Their extreme ends are hinged to prevent friction against the material as it passes by the gauge.

The table, upon which the material is placed, is so constructed that it may be used as a double travelling table, or a single travelling table. When used in the latter manner, the bolts are taken out of the cross tie at the rear end, and the back table is held fast by a bolt to form a stationary table to receive the sawed lumber as it falls from the saw. The use of the tables as a double travelling table is for halving or quartering logs and spliting square timber.



Defiance No. 6 Bolting Saw.

The spur dogs are arranged to hold the material by each end. The one nearest the saw is adjustable on the table for different lengths of work, with rack and pinion movement operated by a ball lever for throwing the dogs into the work. By this arrangement the material can be sawed to any angle desired.

Quartered Oak for Veneer

Until recently it was considered inadvisable, if not impossible, to properly slice quartered oak to be used for veneering. Lately, however, rapid strides have been made in this direction and a great deal of quartered oak is now being sliced and used successfully. It requires different handling from the sawed veneer, but where it is properly worked and intelligently used, it is for many purposes extremely satisfactory.

Your grading rules for quartered oak veneer admit of bright sap without limit. I do not see the logic of this, for it certainly is a defect and a serious one. In lumber one inch of bright sap is admitted, but each additional inch is considered a defect in the grade of firsts and seconds which corresponds to your standard grade.

Taking up the cheaper woods, such as basswood, maple, plain oak, beech, birch, elm, etc., I believe there is an oppotrunity for much greater efficiency in grading it to meet various requirements. I do not know how far careful grading has been carried, but I am convinced that it is desirable. From a small experience in this line, I would say that standard inspection of single ply veneer could be made with profit to the manufacturers and advantage to the consumer.

It would seem that veneer might be inspected so as to give the customer standard grades of just what he needs very much the same as is done with lumber. The price, of course, would have to be based on the value of the different grades.

The proper manufacture of single ply veneers is fully as important in the cheaper woods as in the higher grades.

We cannot overlook the fact that even though we consider the last mentioned woods rather low grade and used mostly for centers and backs, it is just as important to have a smooth core on which to place the high-grade veneers as it is that the latter should be properly placed and carefully attached. Too much care cannot be exercised in properly preparing the log for cutting and in cutting it into veneer.

In the hardwoods as well as in the other grades of lumber, manufacturers and merchants have every reason to look forward to a healthy and strengthening demand in the near future. Notwithstanding the severe drougth of midsummer in certain sections, which has reduced slightly the grain yield, the harvest of the great staples will this year undeniably break all previous records. The handsome returns to farmers that the products of their farms will produce will undoubtedly have a beneficial reaction upon lumber demand by way of extension and repair.

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps

FAVORITE
SHANTY RANGE

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

Timber Estimates

With increasing values in timber land, accuracy in estimates of standing timber is all important. We are practical foresters and make all estimates according to the most approved methods, assuring the smallest margin of error. We furnish forest maps showing the character and location of timber and the average stand in each, as well as the topography; also the blocking of townships in one mile blocks, a most necessary piece of work in the economic operating of timber lands.

A Large Paper Company's Opinion of Our Work

Great Northern Paper Company
Spruce Wood Department .. ..

Bangor, Maine, Dec. 24, 1909.

Dear Sirs,—
Your work in blocking and estimating of approximately forty thousand acres, owned by the Great Northern Paper Company, this summer, was most satisfactory. The results of such work are unquestionably of value to us in handling timber lands.

Very truly yours,
F. A. GILBERT.

Appleton & Sewall Company,
City Hall Building,
Bangor, Maine.

We survey wild lands for the renewal of lines to prevent encroachment and to get actual acreage, the old surveys often being faulty.

We appraise for present and future worth—of particular importance to Bond and Banking Houses in connection with purchases and sales.

Our Booklet F, "Applied Forestry," will prove of interest. Mailed upon request.

We are pleased to refer you to the Great Northern Paper Company, Bangor, Maine; H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅓ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ¾ in. to 8½ in. bore.

EDGINGS

Ontario

The R. E. Kinsman Lumber Company, Hamilton, Ont., are reported to have assigned to Walter Anderson.

During a recent storm a sawmill at Ailsa Craig, Ont., belonging to Mr. Samuel Gillies, suffered destruction.

The Dominion Wood & Lumber Co., Ltd., Toronto, Ont., has recently been incorporated with a capital of $250,000.

Mr. Geo. H. Belton, a well known lumber dealer and planing mill owner, states that a large mill for manufacturing lumber will be erected at Sarnia as soon as reciprocity becomes a fact.

The sawmill belonging to Mr. Thos. Connell at Fenelon Falls was destroyed by fire a few weeks ago. One and one-half million shingles were consumed. The origin of the fire is unknown.

The planing mill and lumber stock of George Mustard, Shelburne, Ont., were destroyed by fire recently. The fire is supposed to have started from a dry kiln. The loss is estimated at between $10,000 and $15,000, with insurance of $7,500.

The tugs Reid, Sarnia City and Fisher, of Port Huron, Mich., towing a raft of 6,000,000 feet of logs from Georgian Bay, encountered heavy weather when approaching Sarnia on September 7th and the raft was torn from them. The logs were scattered along the beach for several miles.

The planing mill of the Ludlam-Ainslee Lumber Co., Sarnia, Ont., was recently visited by fire causing damage estimated at $10,000. It is thought that a hot box ignited a pile of sawdust, thereby setting fire to the building. The mill is a branch of the Ludlam-Ainslee Lumber Co., of Hamilton and Leamington, Ont.

The Gull River Lumber Company's planing mill at Coboconk, Ont., was destroyed by fire recently. The sawmill and shingle mill nearby were saved. The loss in building, machinery and lumber, will probably be between $4,000 and $5,000, which is partly covered by insurance. The cause of the fire is unknown. It is expected that the company will rebuild at once.

Eastern Canada

Mr. G. S. Anderson's sawmill at Masquash, N. B., was recently destroyed by fire.

The Manouan Lumber, Power & Pulp Company has been registered at Montreal. The president is the Hon. G. R. Smith.

Mr. McLaurin, of the Charlemagne Lac Ouareau Lumber Company, Limited, Montreal, has been on a visit to New York.

The sawmill and workmen's dwellings at Lake Annis, N. S., recently destroyed by fire, are being rebuilt by Mr. D. R. Saunders, Yarmouth, N. S.

Stanley Douglas, of Stanley, N. B., has under contemplation the removal of his mill from that place, and the erection of a new mill at Fredericton.

Mr. Jno. R. McLeod, of the McLeod Lumber Company, has become a member of the firm of Messrs. F. B. McCurdy Company, stock brokers, Montreal.

Messrs. Walter McLellan, J. M. Gunn and R. S. Wilson are starting up a woodworking plant at Belmont, N. S., where they will look after all kinds of contract work, building and mill work.

The death occurred on Aug. 26th of Mr. Jno. Gibson, lumberman and merchant of Marksville, N. B. Deceased was a brother of Mr. Alex. Gibson, so well known among lumbermen in the Maritime Provinces.

The A. Cummings & Sons, Ltd., at Coaticook, Que., propose installing at an early date a 125 h.p. sawmill engine as an addition to their present power plant. The works include a saw, shingle and a clap board mill.

The Roberval Paper Company has been registered with a capital of $3,000,000. It has been formed for the manufacture of mechanical and chemical pulp and paper, and for all the derivatives of these products, in the town of Roberval.

As soon as the style of bridge to be adopted has been decided on, the provincial government will erect a new bridge for ordinary and street car traffic across the Reversing Falls at St. John. The present suspension bridge is old and weak, and street cars cannot cross.

It has been stated that over $2,000,000 worth of pulpwood, standing and stock, has recently been destroyed by forest fires in Newfoundland, and many thousand mill logs and railway ties have also been wiped out by the great fire that swept the district around Bishop's Falls.

Over a thousand acres of lumber lands were destroyed by forest fires between Sussex and Penobsquis. The principal losers are McIntyre Brothers, Walter McMonagle, Chittich Brothers, Elkanah Hall, Philip Walsh, Harry Morton, Al Freeze, Lisson Brothers, Ed. Wallace and Byron McLeod.

Mr. Carl Riordon, of the Riordon Paper Company, Limited, and Mr. William Rutherford, of William Rutherford & Sons Co., Limited, have been nominated by the Montreal branch of the Canadian Manufacturers' Association as members of committees to be elected at the annual meeting of the Association fixed for October 10th.

An extensive forest fire which has been raging in Newfoundland dangerously threatened the pulp and paper mills of the Albert Reed Co. This plant was recently completed at a cost of $4,000,000 and is situated at the eastern end of the Exploits river about 20 miles east of Grand Falls, on a site of the Anglo-Newfoundland Development Company's pulp and paper plant.

The plant of the Woodstock Woodworking Company, Woodstock, N.B., was seriously damaged by fire recently. The blaze commenced in the furnace room and spread rapidly. The buildings destroyed included the planing mill, boiler and engine house, and dry kilns. Considerable damage was also done to the wareroom. A portion of the machinery was saved, including a moulder, heavy planer, self-feed rip saw, and a buzz planer. The employees succeeded in saving their tools. The loss is figured at $20,000, which is only partially covered by insurance. The company sustained a heavy loss in March last, when their warehouses and stocks were destroyed by fire.

The architects of the Riordon Paper Company, Limited, Beaver Hall Hill, Montreal, have prepared plans for the erection of a new mill at Calumet, Quebec, in place of that recently destroyed by fire. The approximate cost is $75,000. The output will consist principally of railway ties, shingles and clap-boards. Tenders for the work have been called for. The construction will be of steel and cement.

The shareholders of the Laurentide Paper Company have approved the reorganization scheme under which the assets and good will have been sold to a new company incorporated under the name of "The Laurentide Company, Limited." Payment is to be made by shares of the new company of the aggregate par value of $7,200,000, the shareholders receiving two shares of the new company's capital stock in exchange for each share of the old company.

Lately there has been, in Montreal and district, a growing demand for 2 x 5 and 2 x 6 spruce, which is being used for factory flooring. Instead of being laid flat it is laid edgeways, thus forming a floor about 5 in. thick. This is obviously of a slow burning nature, and makes for the greater safety of a building from fire, with a consequent reduction in the insurance rates. Recently many factories in Ontario and the Province of Quebec have been constructed with these floors.

Western Canada

The North American Timber Holding Company, of Victoria, B. C., has been incorporated with a capital of $50,000,000.

A supply of cedar to the amount of 1,000 cords for block paving has been called for by the Board of Control of Winnipeg.

The Yale-Columbia lumber yards at Nelson, B. C., were fired recently by an incendiary but were aptly saved from destruction.

A sawmill belonging to the Serpentine Lumber Co., near New Westminster, B. C., was totally destroyed by fire recently. The structure was formerly the property of Messrs. McLean Bros.

Cushing Brothers & Company, Limited, Calgary, Alta., have been incorporated, with a capital of $500,000, to carry on business as manufacturers and dealers in lumber throughout the Northwest and elsewhere.

The Ain River Development Company, Limited, Prince Rupert, B.C., has been incorporated, with a capital of $100,000, to acquire and deal in lands, buildings, timber limits, claims, etc.

An English syndicate has purchased the water rights of the Paterson-Eckert Lumber Co., at Chilliwack, B. C., and it is understood that a cement plant will be erected there to cost in the neighborhood of $500,000.

The Canadian West Lumber Co., of Vancouver, are having plans prepared for a mill to be built at Comox, B. C. The plant will consist of a band mill and planing mill, the former to have a daily capacity of 60,000 feet.

The Powell River Paper Company, whose new mill has not been in operation, is already making plans to double its capacity by the erection of a twin mill adjoining it. The company's offices are in the Winch Building, 739 Hastings street, Vancouver.

The Vancouver Timber & Trading Co. has purchased from the Red Cliffe Lumber Co., of Duluth, some 30,000 acres of Crown granted timber lands on Vancouver Island, on which is standing close to two billion feet of first-class merchantable timber.

The British Canadian Lumber Co., Vancouver, are erecting a lumber mill at Lulu Island, B. C., at a cost of $400,000. The mill will be 72 by 292 ft., exclusive of dry kilns and box factory. It is understood that much of the machinery will be purchased in Vancouver.

A tract consisting of 30,000 acres merchantable timber has been sold by Alvo von Alvensleben, of the Vancouver Timber and Trading Company, to a syndicate of Duluth capitalists. It is understood that the timber will not be cut until after the completion of the Panama canal.

The Netos Timber Company, Limited, Vancouver, B.C., has been incorporated, with a capital of $50,000, to carry on business in the Province of British Columbia or elsewhere as wood, timber and lumber merchants, sawmill and shingle mill proprietors, dealers in sawn timber, wood shingles, poles, etc.

Despite competition of American mill men the demand for rough lumber from the prairies is reported from Vancouver to show no signs of decrease, while next year's lumber requirements from these districts is expected to show an increase of over 75 per cent. owing to the large influx of settlers.

At present the lumbermen and railway companies in British Columbia, as a result of legislation at the last session of the legislature, pay a proportion of the cost of fighting fires on their property and in future, as the result of a conference between Hon. W. R. Ross, minister of lands and other government officials, and a number of prominent lumbermen and railway officials at Cranbrook, they will contribute to the cost of preventing the outbreak of forest fires to which end the chief efforts of the government are now being directed.

The woodworking industries throughout Canada generally are favorably reported as being in a very active condition.

According to the estimates of Mr. J. E. Beerbohm, London, compiled from data furnished by his own correspondents, covering a large number of countries, and published in the Evening Foreign Trade List of Aug. 11, the total wheat production for this year will amount to over 1,725,000,000 bushels from the wheat producing countries of the world. Of this Canada's output is estimated at 184,000,000 bushels.

Seasoning Wood by Electricity.—In France a new process of seasoning timber has been tried which, it is claimed, completely does the work in a short time, no matter how green the timber may be. A tank is filled with a solution containing 10 per cent. borax and 5 per cent. of rosin and a small amount of sodium carbonate. The timber is placed in this between two lead plates. The current is said to drive out the sap and deposit borax and resin in its place.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

A Band Mill Without a Peer

Best balanced and most symmetrical band mill ever designed

The despair of imitators
Built with 6, 7, 8, 9, 10 and 11 foot wheels
Does not overhang its foundation
Is the heaviest band mill built
Also the perfection of simplicity
It holds all the cutting records
Has the greatest range of top wheel
Double spring cushion tension device
Steam straining engine when specified
Quick opening bottom guides
Bottom guide completely buried in husk frame
Safety upper guide
Steam controlled upper guide when wanted
Steel spoke V section bottom wheel
Chain oiling bearings
Hubs are longer than on any other brand
This insures a very rigid wheel
Wheels tilt from front and rear
The standard of excellence
Every feature original with us
We build every machine required in an up to date mill

Wire Rope

For Every Requirement

We are specialists in the manufacture of wire rope. We can ship from stock any length or size of the wire ropes usually supplied and can manufacture specially a rope exactly suitable for your requirements. Perhaps you are having wire rope troubles—if so—drop us a line advising us your requirements and we will be pleased to make suggestions as to the class and style of rope you should use. We have had years of experience—and should know.

The Dominion WIRE ROPE Co., Limited
MONTREAL
General Supply Company of Canada—Winnipeg Agents

JEFFREY
3839-IC

Jeffrey Wire Cable Conveyor

handling refuse from Saw Mill to dump, capacity of this mill is 20,000 feet lumber daily.

Conveyor is 230 feet between centres, travels at speed of 100 feet per minute.

We design and build conveyors for handling Lumber, Logs, Refuse, Saw Dust, Slabs and Ties. Every Conveyor is economical and dependable for the particular work it is intended to do.

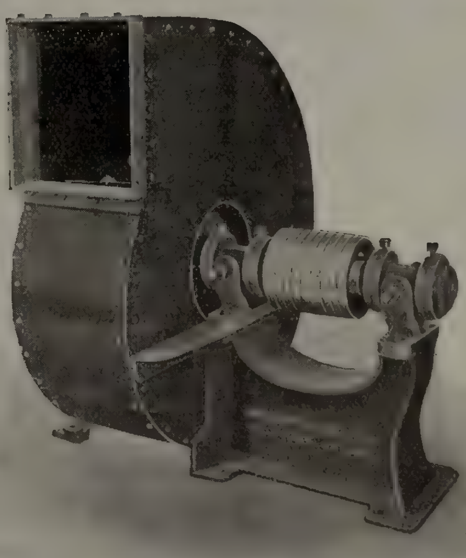
Sheldon Slow Speed Exhaust Fans



The fans that are revolutionizing the shaving exhaust business. They will handle wet or dry, long or short shavings and sawdust, and will do this work with a guaranteed reduction in speed of from 25 to 40% less, and with a power consumption of from 20 to 35% less than any other exhaust fan.

Descriptive circulars sent on request.

Sheldons, Limited - Galt, Ontario

We have been asked:
"Are you interested in the carpenters and the Disston Saws they buy, even after you have their money?"

THIS is a question easily answered. Do you suppose for an instant that we could have retained our regular trade, constantly increasing it, built up and maintained the largest and greatest works of its kind in the world, over a period of seventy-one years, had we not seen to it that the articles we sent out were "making good" and satisfying the user?

LARGEST PLANT IN THE WORLD

We want to force home to you the important fact that our plant is by far the largest of its kind in the world, consisting of 58 buildings, covering 50 acres. We employ 3500 men, and during almost three-quarters of a century—the period we have been in business—very little time has been lost by the employees. You must realise that it requires "some orders" to keep an establishment of this magnitude going.

There surely must be more than ordinary merit in that brand of goods which creates and satisfies the demand over a long period of time.

PROTECTS THE USER

We certainly do want to know if any Disston Brand Saw, Tool or File does not stand up to our guarantee. That guarantee is sufficiently broad to protect the user on every reasonable point. If you have a Disston Saw, Tool or File that has failed you through any cause of ours, let us know, and we will see that you bear no loss on our account.

Each and every article bearing the name DISSTON carries a full warranty as to material and workmanship.

And this guarantee has been in force since the first Disston Saw was made.

There are millions and millions of Disston Brand Saws, Tools and Files in practical use all over the world, which are giving the highest satisfaction. Of course, you will appreciate that almost every individual has his own ideas and opinions and it is impossible to cater to each, particular in cases where they may be prejudice; so our only recourse is to satisfy the majority, and this we have been doing for over seventy-one years—making the goods of superior quality and after designs which have been demonstrated by practical use to be best adapted for the purpose.

It is noteworthy, however, that where we have one complaint, we receive thousands of letters voluntarily testifying to the superior worth and durability of Disston Brand Goods. This speaks for itself.

Neverless, we are always open to conviction, and if a man has complaint to make about any of the Disston Goods, it is but fair and just to us that he enter the complaint; for it is by considering, fully digesting and going into the cause of the trouble, in addition to our constant experimenting and investigations which enables us to so improve and perfect Disston Goods as to bring them up to the highest point of efficiency. When a man has occasion to find fault with any of our goods we do not consider it "a complaint," but a stimulation and a reason for increased vigilance in looking to the safeguarding of the high prestige we have achieved for the name Disston.

MOST PRACTICAL EXPERIENCE

We have the experience—and broad experience at that—extentending over seventy-one years, not only in the making but in the using of tools. Think of the enormous size of our plant; think of its many diversified departments and their ramifications—Steel making, Saw making, the making of various Tools. File making, Wood working departments, Machine Knife making, Machine Shop. Think of the enormous quantities of tools and materials we buy from the outside and think of the great quantity of tools of our own make that we use. When you consider all these points, it will give you some idea of our experience in the manufacturing and use of tools. And that experience we make Count in the perfecting of our manufacturing facilities and the increased efficiency of our own brand of goods.

MADE FOR EFFICIENCY

In the Disston Brand Saws, Tools and Files you have the advantages of the product of a progressive, up-to-date factorp, the Largest in the World. Where the goods are made throughout, from the making of the steel itself—the superiority of which has been demonstrated for the past fifty-six years—to the finishing operation; and each process is performed by mechanics of long experience and highest order of skill.

We want to say to you, and say it positively, that Disston Goods are made not merely to sell, **but for practical use.** All materials used are of highest grade; the steel is properly hardened, tempered, and ground under the Disston exclusive processes; each article carefully inspected at various stages of the work, and finished in a workmanlike manner. **We Fully Guarantee them to be of Highest Efficiency and Unequalled.**

WE ARE INTERESTED

Reverting to the question:—Yes, we are interested in the carpenters and all other users of our tools, as well as the tools themselves after they have been bought and put to use. For we take great pride in the successful results they have achieved in the working, and fully realise—have realized for years—that the world-wide reputation we have earned can only be maintained by furnishing goods of the highest efficiency.

THAT RUNNING WASTE

"Stop, look and listen," is considered the acme of warning injunctions at railroad crossings; and the reason is because it calls every human faculty into action that should enter into the protection of the public, and in turn of the railroad.

Every manufacturer knows that by installing clutches to control machinery instantly, your employees are afforded protection; and, in turn, by shutting down idle groups of machines, you save power. But had you thought of saving power while running—your biggest item. That's where the POSITIVE Combined Jaw and Friction Clutch figures. It will couple a driving shaft at any speed into a driven shaft at rest against full load. The frictions grip until the two shafts come to the same speed; then the jaws engage and drive the load, the frictions releasing.

There is no slipping, no loss of power while running. By the same token, the POSITIVE Clutch will do the hardest duty satisfactorily. If you have a "tough transmission proposition," we want to show you where we have "licked that kind to a frazzle."

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super-heated steam practice."

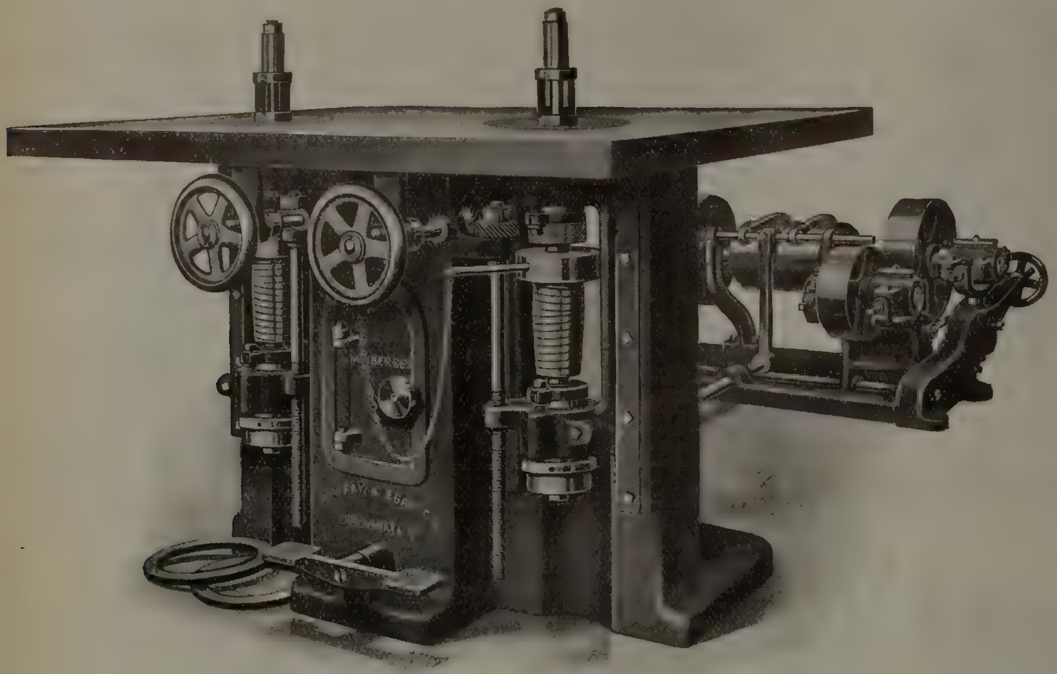
Write Us for Samples

Manufactured only by

COMMERCIAL OIL CO., Ltd.
HAMILTON, ONT.



No. 265 Double Spindle High Speed Shaper.

9,000 R. P. M. is the spindle speed of the new Fay & Egan No. 265 Double Spindle Shaper. Other so-called "High-speed" shapers run about 6,000 R. P. M.—a difference of 50% in the efficiency.

With spindles running perfectly true at this speed, your work will be smoother, requiring less labor in the finishing-room—easier and less dangerous to the operator—and the time now required for shaping will be reduced 50%.

THE REASONS

THE SPINDLES are made of forged crucible steel, mounted in rigid housings which are fitted into planed, gibbed ways their entire length. Housings have independent vertical adjustment and both spindles drop below the table.

THE COUNTERSHAFT consists of a base cast in one piece on which all pulleys and shifters are mounted. This construction, exclusive in our shapers, eliminates assembling upon arrival, assures proper alignment of belts and makes it possible for the belts to stand up to the high speed required.

THE BEARINGS are made of phosphor bronze and tapered, with oil reservoirs completely around the inner bearing, designed in such manner as to insure a continuous oil flow. This construction permits the operation of the spindles at the extreme speed of 9,000 R.P.M. without danger of burning.

THE CONTROL of this machine is instant at the will of the operator by means of a foot treadle in front. The column is a single cored casting, very heavy, but designed in such manner that it is entirely out of the way of the operator and supports the working parts without vibration.

The Speed is High, but the Price is Not.

Write for Catalogue. It's Free.

Solid and Inserted Tooth

Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

R. H. Smith Co., Limited
Saw Manufacturers
ST. CATHARINES, ONT.

RIGHT DESIGN + RIGHT MATERIALS = BEST RESULTS

Locomotives to give the best results must be constructed of the right materials and of the right design. Our locomotives for logging, quarrying, plantations, and switching around mines and industrial plants, are designed by engineers who have made a study of conditions in the fields where locomotives are used, and they know what is needed.

Every piece of material entering into their construction must undergo a thorough test and conform to the same specfications required for the largest trunk line locomotives. Only the best materials are used, insuring long life and satisfactory results.

They are built friom special designs to meet special needs, and are assembled from stock parts made to accurate gauges. With this method repair parts must fit.

These locomotives are equipped with large boilers with long flues, are easy steaming and light on fuel.

Interchangeable repair parts are kept on hand at our works at Longue Pointe, Montreal, Canada.

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

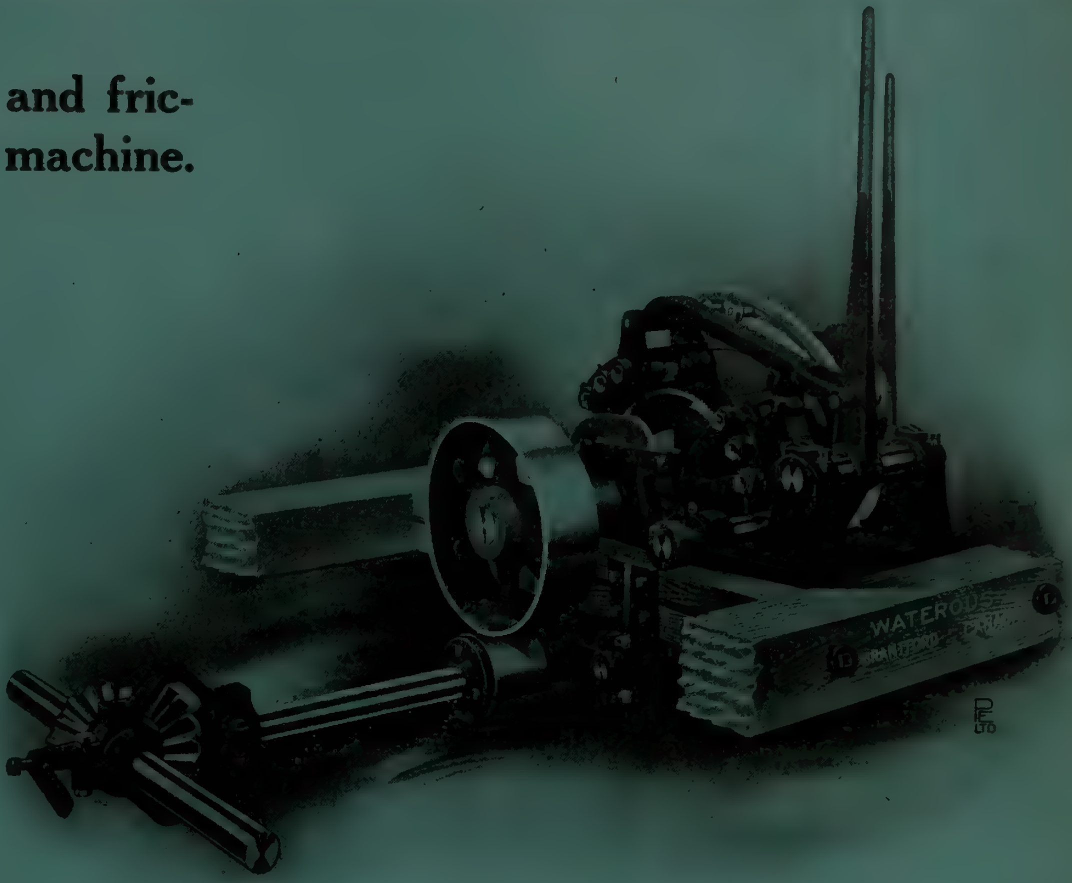
The Waterous Combination Setworks

A setting mechanism and friction receder in one machine. Quick, powerful, safe and absolutely accurate. Can be attached to any rack carriage having set shaft not larger than 2-$\frac{15}{16}''$. Easy on the carriage, easy on the operator and easy on itself.



This Setworks cannot Develop Lost Motion

In the ordinary Setworks the setting lever movement that determines the amount of set is controlled by stop pins placed in a stationary quandrant. As soon as the connections between the lever and the pawl cages become worn, lost motion is bound to develop, and the accuracy of the set is lost.

We overcome this in our Setworks.

The quandrant carrying the stop pins is fastened to one of the pawl cages—on the movement of the setting lever the cages start from the home stop, advance until they strike and then return to the home stop. For the same position on the stop pins the travel of the cages will be the same, no matter how much the connecting links are worn. All wear comes behind the pins and *the absolute accuracy of the set is a permanent feature.*

Other Features

1.—**The friction receder lever** lifts the pawl automatically from the ratchet wheel before receding can commence. This does away with a pawl lifting lever.

2.—**Only two levers are required** for both operations of setting and receding, both are placed most conveniently for the setter, no stooping is necessary. The operator can thus work quickly, accurately and without fear of stripping his ratchet wheel.

3.—**Tool steel pawls** extend full across the 4″ face of wheel, three pawls are carried in each cage, the latter made very wide and open for quick adjustment and to prevent clogging by saw-dust.

4.—**Quandrant is double slotted,** carries our patented knockback pins, arranged to give four standard cuts without shifting.

5.—**Pawls** are arranged to set by 1/32″ up to 3″ at one full throw of lever.

6.—**Every part is made to template,** repairs can be quickly furnished. The setworks can be supplied without receder attachment if desired.

Let us send you our new Carriage catalogue containing full description of this Setworks. Bulletin No. 107.

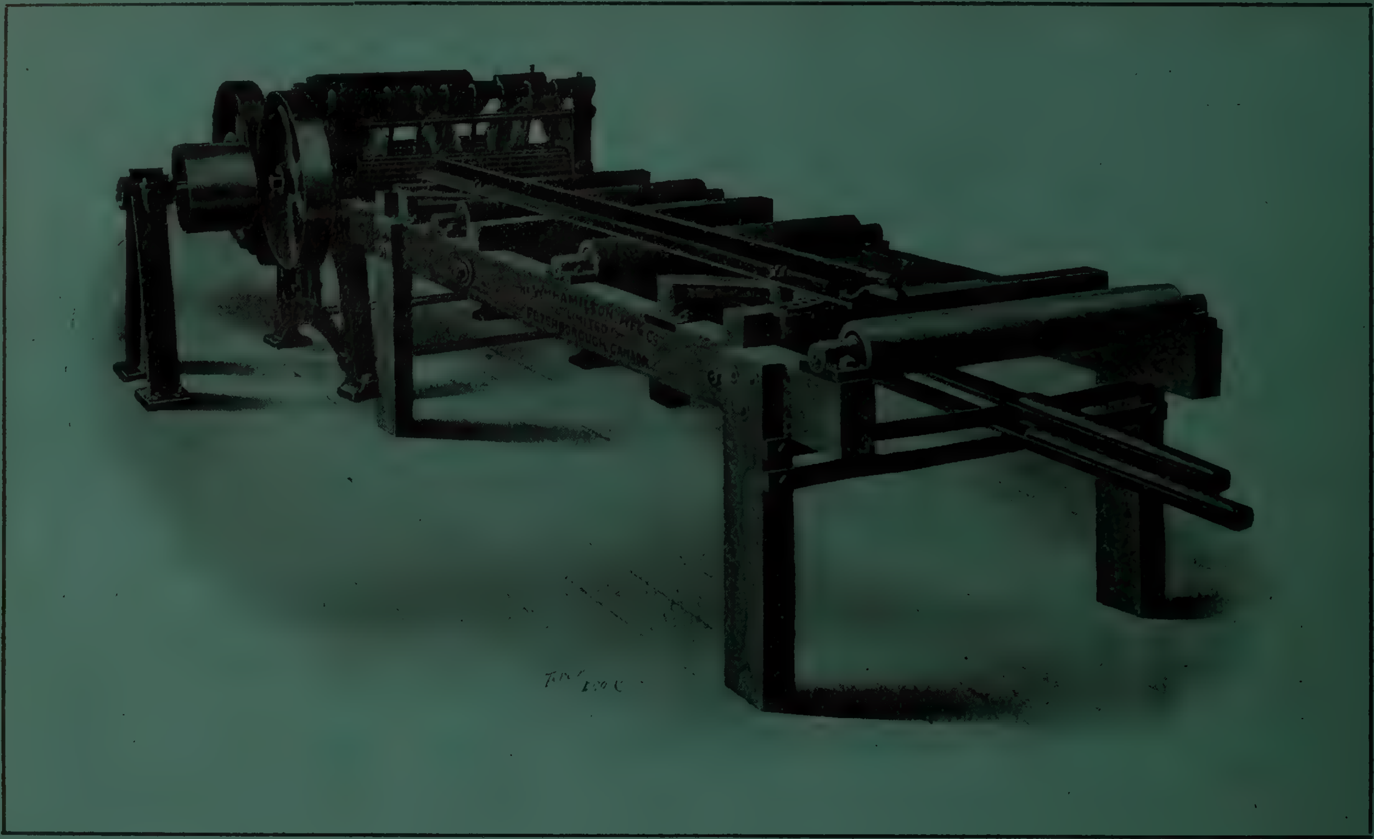
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound ; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows : Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

Good Logs Make Good Lumber

Besides supplying our customers with "A I" lumber, we are able to ship promptly. Our mills and shipping facilities are unequalled in Canada. We have a complete stock of rough and dressed Hemlock, Spruce, Pine and Hardwood.

A Skid containing about four million feet of logs

Even if your present millman is supplying you with "good stuff" give us a trial—we may be better. Remember we have high-grade stocks, lowest market prices and we ship when we say we will.

Fassett Lumber Company, Limited

Fassett, Quebec

Get Busy, Mr. Dealer

Don't sit with your hands folded while your competitor down the street is moving his stock out quickly.

Handle a line of lumber that sells well, prevents complaints, is up to grade and always satisfies your customers.

We aim to produce the highest quality of lumber at the lowest possible cost. Our workmen are skilled, are under our personal supervision, and as a result, every stick of lumber turned out is strictly up to grade and produced at a minimum cost.

Dealers who handle our lumber always come back for more. Have you tried a car yet? If not, get busy. Quick shipments our specialty.

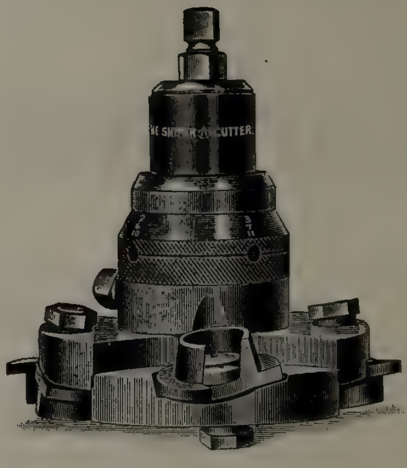
The Colonial Lumber Company Limited

Pembroke - Ont.

Your Output

of Flooring, Ceiling and Siding can be improved and increased by adopting a



System of Shimer Cutter Heads

which systematize the work in planing mills and solve the problem of economical woodworking. They last long and cost little. Made of Steel Forgings of 60,000 lbs. tensile strength they represent the strongest combination possible to meet every emergency.

The illustrations herewith show the compact and workmanlike manner in which the Shimer Cutter Heads are constructed—how the vital principle of clearance is applied to all leading bit points—how the alternate and shearing effect of the cut reduces to a minimum the tearing out tendencies in working cross-grained lumber. A study of the illustrations will also show that the Bits have the exact shape in their exterior circles, insuring that a uniform product will be maintained indefinitely without extra trouble and expense.

Through the "make-ready" built into the Shimer Cutter Heads your workmen are relieved of the labor connected with filing and re-filing straight bits to pattern—the lining up of such knives and other needless worries.

They are not an expense, but they save expense by giving you an easier and faster way of getting out your work.

Send for Catalogue and Pattern Book showing the regular and special tools we make. The more intricate and difficult your patterns are to maintain the more time and labor our tools will save.

How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, *power*, by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for ***saved energy*—economy.** Built up of plies of rubberized fabric; cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skilful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

GOODYEAR Rubber Belting

High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse power transmitted is large and the demand for tensile strength is great.

Black Diamond Belting

Lighter in weight, lower in price than above, but same in *quality*. Great quantities sold to **Sawmill** trade. Hundreds of mill owners say it gives better service than any other belt ever used.

Red Cross Belting

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

Elevator Belts

We make a specialty of **Elevator Belts.** Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping ; insures longest service.

IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember* **Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog tonight.**

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, October 1, 1911 No. 19

The Downfall of Reciprocity

The overwhelming defeat of the reciprocity movement in Canada has an important bearing upon the lumber industry. In the first place it puts an end for the time being to the hope that the duty of $1.25 per thousand feet upon rough lumber from Canada entering the United States will be removed. In the second place, however, it gives the lumbermen of Canada reason to hope that the new government will place a duty upon United States lumber entering Canada, which will at least be as great as the duty on Canadian lumber entering the United States. There is even another ground of hope in the situation, as there has already developed in the United States a strong feeling in favor of free lumber which may, in the not distant future, result in the Canadian lumber manufacturer securing, without any reciprocal consideration, the extension of his market in that country.

A feature of the case which will prove interesting, and possibly troublesome so far as the United States are concerned, is that which has to do with the pulpwood situation. The United States undertook, as a sort of rider to their version of the proposed reciprocity agreement, to add a clause permitting Canadian pulpwood to enter the United States free of duty so long as it was not subject to any export restriction on the part of Canada. It was expected that, as a development of this policy, a free exchange of pulp and paper of the value of four cents a pound and less would be effected. Although the reciprocity measure has been defeated, the clause permitting the free entry of pulpwood from Canada into the United States is already in effect and stands, irrespective of the reciprocity measure. It is quite within the range of possibility that the United States will now find that other pulpwood exporting countries will want equally favorable treatment with Canada and that either universal free import of pulpwood will have to be permitted or that the free import from Canada will have to be rescinded to appease the other countries.

The Canadian lumber industry has possibly as much to be thankful for over the defeat of reciprocity as it would have had over its success. If it opens the way for the placing of a duty on lumber entering Canada from the United States, the Canadian lumber industry will benefit greatly. Canadian lumbermen should immediately prepare a strong case for presentation to parliament for the protection to which the facts of the case so amply entitle them.

Too Many Men on the Road

About the most frequent complaint which one hears among lumbermen in all branches of the trade to-day is, that there are too many men on the road selling lumber. The remarkable development which has taken place during the last few years in the lumber trade is in a large sense responsible for this. The time was, when good lumber sold itself readily and poor lumber could be got rid of at a profit without any great amount of effort. Conditions have changed however, and to-day the man who makes lumber or the man who sells lumber for a livelihood has to organize a systematic selling campaign. He must go into the highways and byways with his lists and be prepared to meet with the stiffest kind of competition. The flooding of the lumber markets of Canada with United States lumber, which has been manufactured under conditions, the reverse of economic, has been the chief factor in bringing about the change. Other causes have been at work also, but whatever they may have been, it requires to-day, the most skilful kind of salesmanship to conduct a lumber selling business successfully. In every part of the country where lumber is consumed the ubiquitous lumber salesman makes his regular visits and often finds that his competitors have been there ahead of him. It would seem to be a case for the survival of the fittest, but this is one of those instances where the old adage falls down, and so far as individual contracts for the sale of lumber are concerned, it is more often a case of the survival of the man who offers simply the lowest price. The other considerations which enter into a business transaction are too often ignored. The responsibility of the salesman or the ability of his principal to deliver exactly the class of lumber which he contracts to sell is frequently forgotten, in the desire to take advantage of what appears to be a good bargain. Men are travelling about the country to-day with lists of lumber for sale, who have no qualifications whatever for the work. Many a traveller who represents himself as able to supply the various classes of lumber required, knows as little about the lumber he sells, as about any other line of business. The result is, that although he may be a clever salesman he frequently antagonizes his customer after the first deal has been put through. He takes an order which he, or his principals, cannot fill. His principals perhaps, in their endeavor to make good, deliver the nearest thing they have to the grade of lumber ordered. The customer is dissatisfied, and the wholesaler or manufacturer is blamed. Isolated cases of this sort of thing would not be a serious matter, but it is going on all the time. The complaint is general that many travellers are sent upon the road who do not understand the goods they represent.

The whole lumber trade is suffering, as a result of this. The retailer and the manufacturer have come to look upon the inexperienced wholesale traveller, as a necessary evil. The competent wholesaler is a recognized advantage to the trade, but the other man is not. The manufacturer and the retailer, finding that they cannot avoid the visits of such men, put up with them, and the standing of the general wholesale trade is injured, as a result. Dealers who enter upon contracts with such men, knowing the risks they are running, have themselves to thank, if they are bitten, yet they frequently take a chance and are to that extent responsible for the continuation of the unsatisfactory state of affairs.

An incompetent or unbusinesslike wholesaler calling upon a retailer or manufacturer to sell or to purchase stocks should be turned down without compunction, if the retailer or the manufacturer, knows him to be incompetent. Instead of this, it frequently happens that a manufacturer for instance, supplies him with a block of stock, because he offers a good price, and a retailer buys from him, because he offers the lumber at a low price. Each thinks he is getting a bargain, and so he is, if the deal goes through. Everyone hopes that he, himself, will not be bitten, but every once in a while somebody is bitten, and then the cry goes up that such a man should not be allowed to be in the business. Neither he should, and the first men to put him out of business should have been those who were foolish enough to do business with him.

As the result of a recent failure of a wholesale lumber dealer. in a large Ontario city, several millmen lost considerable sums of money. It was found upon investigation that the wholesaler was carrying on his business on too small a margin. He was offering bargains both ways, and in the end he failed. The very fact of a bargain being of an unusual nature should make the customer or the manufacturer suspicious. But it does not. We have become a nation of bargain hunters, and the fault is often our own if we come to grief.

What is the remedy? Most of the businesslike members of the trade have been considering a solution for many years, and have come to a general belief that only one solution is possible. That solution will never be entirely effective, but the measure of its usefulness will depend upon the manner in which it is taken up by the trade. Co-operation is the remedy, and that co-operation should be directed first of all towards making it possible for a manufacturer, a wholesaler, or a retailer, to know what he is ordering, or selling. There should be none of the slip-shod methods of doing business, which characterize the trade to-day. Lumber is susceptible of being graded thoroughly, and scientifically, so that everyone may know exactly what is being referred to in a deal. The three branches of the trade, and industry should no longer trust solely to one another's good nature, common sense, and honesty. These qualifications are essential to business success, and should enter into every transaction, but a black and white record, and a cast iron understanding of the terms of a contract are often of more importance. When the trade has adopted, and put into effect a good system of grading, and inspection, it will be possible to locate quite definitely, those who do not carry on their affairs in a businesslike manner, or those who seek to take advantage of the trade. Inspection, and grading will not be a panacea for all the ills of the trade, but they will go farther towards correcting many of them, than any other conceivable method that could be adopted to-day.

Duty on Lumber Necessary

Only those who make a study of the statistics can form any measurable idea of the vast increase which is going on in the consumption of United States lumber in Canada. Until within the last few years we were accustomed to consider that the balance of trade between the lumber industries of Canada and the United States was overwhelmingly in favor of Canada. The statistics of the last few years, however, show that the time threatens to arrive in the near future when the balance will be on the other side. Statistics of United States exports of lumber are published elsewhere in this issue and they should be read by all who wish to form a proper idea of the situation.

Take the most important item, that of boards, deals, planks, joists and scantlings. In 1909 the exports of these to Canada from the United States amounted to a little over 127,000,000 feet B.M. In 1910 a substantial increase was made, bringing the total to 189,000,000 feet, but in 1911 the total made a phenominal jump to 403,285,000 feet. This increase in quantity was not accompanied by any increase in price, but on the other hand the average value of the lumber thus imported into Canada declined from $26.09 per thousand in 1909 to $22.97 in 1911. These figures are eloquent and show that the United States producer has been at his old game of cutting up into lumber everything that he could lay his hands upon in the shape of a tree, and has found that he could not begin to sell it all in his home markets. He has been obliged to sell much of it at a sacrifice in the markets of Canada. The lumber manufacturers of Canada having a good market for their products and being of a naturally conservative disposition, have been conducting their business in a sane manner, and, had it not been for the enormous quantities of foreign lumber dumped upon their markets they would have been enjoying during the past year a period of unexampled prosperity. Instead of this they have been doing an average business only and have been unable to recover satisfactorily from the period of depression which prevailed a few years ago. It would seem, indeed, from the statistics, that there is every reason for the government to grant the long expressed wish of the lumbermen of Canada for the placing of a duty upon rough lumber entering this country. There is in the general situation, sufficient ground for the government of Canada to take up seriously the consideration of the necessity for protecting the Canadian lumber markets from the inroads of manufacturers in the United States, who, as a whole, are singularly prone to adopt the absurd policy of destroying their lumber resources and at the same time destroying the business of all those with whom they come into competition. The problem is not so much an international one as an economic one. It concerns the preservation of the forests of the United States and Canada and the profitable conversion of our timber resources into finished products.

So far as the exports of Canadian lumber to the United States are concerned the figures also are suggestive. The exports of Canadian boards, planks, deals, etc., to the United States increased in 1911 over those of 1909 by only 18,389.000 feet. This slight increase is in the face of the decrease in the duty upon rough lumber entering the United States, which was reduced from $2 per thousand feet to $1.25 per thousand feet in August, 1909. The average price of the lumber sent from Canada to the United States declined by 49 cents per thousand during the two years. The exports of 1910 were abnormal and for this reason their consideration is not included. With a decline in the duty of 75 cents per thousand feet, therefore, there was a decline in the price of 49 cents per thousand. The natural conclusion is that the United States trade permitted the Canadian exporter to benefit to the extent only of 26 cents out of the 75 cents reduction in the tariff.

If figures ever talked these should shout for a duty upon lumber entering Canada from the United States.

An Injustice to Canadian Trade

The competition which Canadian lumber manufacturers have to meet in all parts of Canada is aggravated in certain parts of the country by the fact that United States exporters in some cases are unscrupulous enough to make false entries of their products. Rough lumber comes into Canada free of duty and lumber which has been dressed on one side is also allowed to enter Canada without duty. On lumber which has been dressed on two or more sides there is a duty of 25 per cent. This is a heavy handicap and it is hard to imagine how any one in the United States could sell dressed lumber in Canada in competition with the Canadian product. That they have been doing so, however, needs no proof. It is an acknowledged fact and has caused much heartburning and wonder to Canadian manufacturers. At a recent meeting of Coast and Mountain millmen which was held at Vancouver, light was thrown upon the subject by some of the members present who made the statement that great quantities of United States lumber, dressed on two sides or more, which ought to have paid a duty, has been sold on the prairie markets without paying tne duty. The allegation was made that the lumber had been improperly classified and that the government officials had overlooked this and were winking at the continuation of the practice.

If the facts of the case are such as they were alleged to have been it is little wonder that the United States trade in lumber with the prairie provinces has increased so rapidly of late. It is the duty of the government to look into the charges closely and to inform the lumber industry as soon as possible whether they find the charges founded or not. If the charges are well founded the government should lose no time in discharging those who are responsible and seeing that the customs regulations are carefully enforced in future. The lumbermen of Canada have received a raw deal from the government of the country for so many years that they have grown callous and probably will not expect any immediate improvement in the situation, if the charges are shown to be true. It is encouraging to note, however, that Mr. J. C. Macdougall, chief customs commissioner at Ottawa states that he will make immediate inquiries into the situation and if any one is found to have been neglecting his duties that he will be dismissed.

At the meeting of the Coast and Mountain millmen which took up this matter, the wider question of the competition of United States lumber with the Canadian product was discussed for the greater part of a whole day. That the situation has become critical is admitted by everyone in the industry. Figures which were submitted at the meeting showed that not only had the United States sawmill man invaded the markets of Vancouver and Victoria, but was actually underselling the British Columbia mills in the markets of Manitoba, Saskatchewan and Alberta. During the months of June and July exports from the United States to the four provinces totalled forty million and thirty million feet respectively. If the sale of United States lumber in Canada continues to increase as rapidly as it has during the last year a permanent injury will have been caused to the Canadian industry in the course of a few years at the most. At present there is such a strong demand for lumber from the prairies that Canadians are able to secure a good share of the trade and there is no question of closing down on account of dull markets. It is only a matter of months, however, since this was not the case, and it may be but a short time before it will come about markets to-day is therefore causing serious anxiety as it will make them much more effective competitors in the days to come when the lumber business suffers from any wave of depression which may be passing over the country.

If the United States firms are being assisted in thus securing Canadian trade, by neglect to enforce the customs regulations properly, the great lumber industry is being done a grave injury by those whom the country pays to protect its interests. The situation should be dealt with immediately and the public taken into the government's confidence and told exactly how matters stand.

A United States View of Yellow Pine Competition in Canada

There is nothing very new in the following editorial from the American Lumberman, but it bears out rather interestingly much that has been said in these columns about the competition of yellow pine from the United States with the Canadian norway pine, hemlock and spruce. It presents quite candidly also a forcible argument in favor of a duty upon rough lumber entering Canada, so as to prevent the dumping of surplus United States stocks in the Canadian market. The editorial referred to is as follows:—

"A letter in this number of the American Lumberman, from Toronto, Ont., states that the increase of the importation of yellow pine from the southern states into Canada, this season, has been especially noticeable. It is coming sharply into competition with the native red (norway) pine, hemlock and spruce. Southern yellow pine also is much in demand for joists and interior finish. A remarkable feature of the statement is that the strong point in favor of southern yellow pine is its relative cheapness, yellow pine boards, from one to two inches in thickness, doubtless in the upper grades, being procurable at from $2 to $6 a thousand feet less than the prevalent prices for red pine, manufactured from native timber in Canada.

"At first blush it seems impossible that the yellow pine of our southern states can be shipped from the Gulf regions and there sold in successful competition with norway pine, spruce and hemlock cut from stumpage in the provinces and delivered on comparatively short rail hauls. That some lumber might reach Quebec or Montreal from Florida, Georgia or South Carolina ports at a freight rate that would leave a profit to the shipper is conceivable. It also may be included in what our correspondent calls yellow pine from the States in some North Carolina pine, which might be handled by all rail, or by sea and rail through Norfolk, Boston and Portland. But it is probable that the greater part of the yellow pine that is going into Ontario is from the middle Gulf states or from territory west of the Mississippi river.

"If this be the correct conclusion it is simply an example of what happens frequently in times of dull market conditions, when mill capacity outruns the normal demand for product. In this respect the experience of lumber manufacturers is like that of those in the iron and steel industries, the makers of agricultural machines and the producers of other manufactures. The home demand being insufficient to absorb the normal output, with resulting accumulation of unsold product, resort is had to foreign markets. Generally speaking, this means that prices must be made low enough to meet competition with articles of like use made in foreign countries. It is probable that mill operators in the South who are selling yellow pine in Canada are pursuing a course in respect to prices unusual in such cases; they have to present an inducement that will divert trade from the home to the foreign product.

"The peculiar fact that southern yellow pine is selling for prices $2 to $6 below prices of norway pine and hemlock produced in the provinces is of special interest in the consideration. That high grade yellow pine, on account of quality and adaptability, can be preferred for certain work among Canadian builders is easy to see. In fact, clear yellow pine for interior finish, doors and other manufacturing uses for years has been sold in Canada, and it has reached Ontario and farther east by an all rail haul. Yellow pine long and large dimension, as well as clear stuff in smaller dimension for special uses, has long been a favorite in Canada, but it has had to compete with the best grades of red pine. But when southern yellow pine condescends to undersell hemlock it is a matter of speculative amazement.

"The most notable two features of the season's southern pine movement into Canada pertain to the apparent necessity of southern producers to unload surplus somewhere in order to realize therefrom, and to the fact that they are cutting prices in that trade despite the generally conceded fact that they are maintaining them in the United States. This is not a matter that need amaze anyone, for, as has been explained, it is the method resorted to by all large manufacturers when they must unload surpluses in foreign countries in order to prevent a complete breakdown at home.

"If there were a Canadian tariff on lumber shipped from the United States the situation would be different, but since our product goes over the line free of duty it is merely a matter of freight rates. Yellow pine can be shipped from the Gulf states to Toronto or Montreal at rates practically as low as to Boston, northern New England and points in the middle Northwest of this country. The southern mill operators have a much better chance to unload lumber in Canada than do the Pacific coast operators to lay down their product in the middle West or the eastern states, yet a large amount of Coast product reaches the Atlantic seaboard for a market."

amount of Coast product reaches the Atlantic seaboard for a market."

Annual Meeting of Order of Hoo-Hoo

Enjoyable Cruise on Lake Huron and Georgian Bay—Important Questions Discussed—E. S. Burgess elected Supreme Snark—Thomas Patterson, Bojum

The annual meeting of Hoo-Hoo, which was held on board the steamer City of Cleveland, during the course of a delightful cruise on Lake Huron, was attended by a large number of members of the order and their families and friends. The trip was extremely enjoyable, and lasted from Saturday, September 9, to Wednesday, September 13. Commencing at Detroit, where the members gathered, the trip took in Owen Sound, Mackinac Island, and Sault Ste. Marie. Splendid weather was experienced throughout the trip, and the members returned to Detroit full of appreciation and enthusiasm over the wonderful beauties of the scenery and climate which they had enjoyed. From a business point of view the annual was both interesting and of the utmost importance. A great many questions of serious moment were discussed, and one or two problems of considerable import were brought up, which, although they disturbed the members considerably, and threatened for a time to destroy the spirit of amity and goodwill upon which Hoo-Hoo is founded, will, it is believed, be finally settled to everybody's satisfaction, and bring about a more peaceful and practical understanding among the members.

As to the trip itself, nothing could be more pleasant than the numerous features of entertainment which were provided, and for which the responsibility fell upon Jeff. B. Webb, of Detroit, and W. A. Hadley, of Chatham, Ont. The members spent the time, while they were not attending business meetings, in sight-seeing, concerts, card playing, dancing, and many other ways, known only to those who have thrown off the cares of business and embarked upon a water voyage.

The unfortunate jarring note of the meeting occurred over the re-election of Mr. J. H. Baird, Supreme Scrivenoter, of Nashville, Tenn. A number of older influential members of the order desired to alter materially the duties of his office. The principal question under consideration was a change in the Scrivenoter's work. The vote taken upon the question was in favor of continuing the present Scrivenoter in office, and it was followed by a request from the Scrivenoter that the order should continue the office of "Supreme Representative." Mr. Baird made this request upon personal ground, and secured an affirmative answer from the order. Then occurred the principal event of discord, which has been referred to above. Those who advocated a change in the duties of the office of Scrivenoter announced that unless they succeeded they would resign from the order. A report to this effect was freely circulated, and other reports of an unpleasant nature quickly followed. The following day the formal resignation of several of the opponents of the Scrivenoter was presented, and it was followed by a number of other resignations.

This unpleasant development was made the subject of a special meeting of the House of Ancients, which was held at the Cadillac Hotel, Detroit, on Wednesday morning, after the arrival of the vessel. The whole order of Hoo-Hoo will await with keen anxiety the outcome of the deliberations of the House of Ancients upon this all-important matter.

It is greatly to be regretted that such unpleasant friction should have developed at an annual meeting of such an order as Hoo-Hoo. All who have the interest of the order at heart will surely hope that a peaceful solution will be found, and that in future no further outbreaks of unbrotherly feeling will ever mar the proceedings of this splendid organization.

The first business session was opened on Saturday afternoon, September 9, by the Hoo-Hoo choir, led by Choirmaster Jeff. Webb, who contributed a number of selections which stirred up the enthusiasm of the meeting. The first item of business was the report of the Snark of the Universe, which was in part as follows:—

Report of the Snark of the Universe

"To the Supreme Nine, House of Ancients and Brother Hoo-Hoo:

"We have met to review the work of the last year and plan for the future of the order. Let us consider the momentous questions involved with the kindliest friendship for each other and the sincerest appreciation of the intent of all to labor for the benefit of the order we love so well.

"Brother Stephenson, in his report, will cover much of the ground usually occupied in that of the Snark; but I will give briefly a few suggestions, which I trust will be received in the same kindly spirit in which they are made.

"The last year has been one of unusual vicissitudes. The financial depression—I speak from having visited Hoo-Hoo in seventeen states and noting conditions therein—has visibly affected the obtaining of members, the collection of dues and the general interest in the order. Many of our best workers, particularly the travelling fraternity—always the best laborers in the vineyard—have been either without positions or holding them on such tenure that they were obliged to conserve their resources; the money usually spent so freely in attending concatenations or in the initial work they occasioned. What is true of them is also true of many lumbermen, whose every dollar and moment of time were strenuously occupied.

"While the edict banishing intoxicants was beneficial to our reputation, it has been a somewhat deterrent influence upon the inceptions of and attendance upon concatenations as many of our genial brothers and kindly companions, while concurring heartily with the banishment of all exhilirating liquidity from concatenations, believe the prescence of the beneficence of the vine conducive to cordiality at the subsequent functions, and became luke-warm when it was Carrie Nationized. We anticipated this, but thought that their places would be filled by many good workers, old and new, who were opposed diametrically to their ideas; but I regret truly to state that there has been apathy instead of interested effort on the part of those who were earnest, honest advocates of the new regime, and consequently what we have gained in reputation we have lost in working material and cold cash. I believe, if this question were submitted to a referendum vote, permitting suffrage only to those whose dues were paid, that, irrespective of how it was settled, it would meet with the hearty and undivided concurrence of all. As it is, many believe the work at Hot Springs not consistent with the majority opinion. It will involve a lot of labor, and I think it will create a new interest, and be the means of the paying up of many back dues, for no question has received such exploiting or has caused such comment in the order, and I firmly believe that many careless ones would pay up rather than lose the privilege of voting. I believe that Brother Stephenson's way is the better.

"As I think Hoo-Hoo more or less a local proposition, I believe that in this question the countries outside of the United States should be considered integers and a law unto themselves.

"Dues.—This matter is one of continual anxiety and causes more labor than all the rest of the order's business. It is reprehensible that many of us permit, through carelessness in most instances, our dues to fall behind, and I would earnestly urge all brothers to see that the sinews of war be forthcoming without so much insistence. I think that if no response is given to a second request for dues—and I believe that no dues should be permitted to be more than one year old—that request for reasons be issued, and if the member is yet obdurate, a request for the return of his button be made. If he has any pride, this should bring the remittance, if he is able to pay, and if not, and he frankly so states, then we, as brothers, are willing to carry him almost indefinitely.

"I earnestly believe that the suffrage of each state should be based on the paid dues and not on the listed membership. This might awaken state pride and be an incentive to greater effort on the part of officers of each locality and jurisdiction.

"The 'Bulletin.'—While I believe that it should be primarily a clearing house of the opinions, sentiments and ideas of the members in regard to all questions pertaining to the order—reports of concatenations and of vicegerential work being prominently featured—I can not agree with some of the brothers as to the elimination of the literary features. While they should be subordinated, I believe that short, interesting articles and the "little nonsense now and then" are an incentive to perusal that often eventuates in the consideration of the other questions contained in each edition, when, as we all know, if devoted altogether to routine or discussion, the magazine would not even be opened.

"Annual Meeting.—Before the often visiting of so many communities, I did not realize what a reversed anachronism, so far as the influence upon attendance at Annuals is concerned, is our present date of meeting. If we wish to subscribe to our sacred tradition, and it is truly a significant one, we can yet let the Ninth day of the Ninth month be its beginning and end, but I firmly believe that if we had our meetings in July, held, as is this one, in some locality where those wishing a vacation could take the trip as all or a portion of theirs, we would easily triple the attendance. September is one of the worst months of the year for an absence from the coast. Brother Stephenson has an idea in regard to the fiscal year to present.

"Appointment of Vicegerents.—More than earnestly would I advise, as have my predecessors, that the recommendations for these more than important positions be made from the last concatenation held each year. It is simply impossible otherwise to obtain officers who are men of caliber and who are popular enough with their communities to obtain best results. We did our best last season, but made mistakes that we could not remedy. Again, as often those we select on recommendation of the district officer can not accept, great delays originate. Let us be sure that the recommendation is sent in directly from the meetings.

"Death Benefit.—When one reads the letters of heartfelt thanks that have come from some of the griefstricken beneficiaries of this fund, he realizes the honor due to those whose gentleness of heart caused its inception. I wish that I had been one of them. Nothing that we have ever done otherwise ever will be so potential for the alleviation of trial and sorrow. We should be safeguarded by a time limit, however, from any attempt to obtain benefits irregularly. This Mr. Baird and Mr. Stephenson will elucidate. Sympathy is divine, but cold cash pays bills when, often, the last cent has been cheerfully sacrificed for the departed one. I truly trust that not only will everyone here subscribe, irrespective of any possible need or otherwise, but will all use his earnest endeavor to bring others to do so; and in this regard I would ask the ladies to give us a helping hand.

"Forest Conservation.—I believe that we should be in accord with this, but that we have no capital sufficient to permit of any expense in connection with it. Personally, I'm for Mr. Pinchot.

"Supreme Representative.—If you desire to continue the Supreme Representative, either as an integer or in combination with some other office, some definite plan must be outlined that will permit of continuity of meetings without so much skipping around to different localities, in order to eliminate a portion of the travelling expense. At Kansas City we decided to endeavor to awaken the East. We should have shanghaied the angel Gabriel for an assistant. The results in the South, Southeast and West, the middle West and up among the princes of Hoo-Hoo in Canada, were very apparent, despite the handicap of such an unprecedented year, and I most sincerely compliment Mr. Stephenson upon the energy, faithfulness and the exhibitions of genuine tact with which he has handled the really most complicated position in Hoo-Hoo to-day.

"I trust that a meeting of the new Supreme Nine and the House of Ancients on this boat will evolve a plan, based upon the experience of the last year. Brother Baird has an outline to present.

"Osirian Cloister.—A considerable item of expense has been the storage and transportation of the paraphernalia of the Osirian Cloister, especially that appertaining to the embalming of the Snark, and I advocate, after thorough discussion with the operative officers of the order, that we dispose of all but that portion of the outfit necessary to the Osirian initiation. We all admired the scenery and the drama of the embalming, but it is practically impossible to give the latter at any meetings, and we do not derive enough amusement or instruction to warrant the continual expense. We who have been supremely honored by your highest gift are more than satisfied if we can only be embalmed, with some simple ceremony, in the essence of your lasting regard.

"Brother Richardson advanced a unique idea in relation to the ladies, upon payment of a fee of $5 being admitted as honorary members, attendance at the annual being their opportunities of intermingling with the sterner sex, and said fund to be administered according to their directions, in acts of philanthrophy, etc. I would be pleased to have him elucidate further any ideas on the subject. I have long been convinced that the more our mothers, sweethearts and wives are with us, the less liable are we to depart from right principles and the higher honor we will be to Hoo-Hoo. Their influence is greater in molding us rightly than is any legislation, sumptuary or otherwise.

"Appreciation.—I wish to sincerely thank Mr. Baird, Mr. Stephenson and all friends for the kindly assistance given me this year and the shouldering of many responsibilities that distance and circumstances rendered it difficult for me to assume, and I wish to extend to Mr. Jeff B. Webb a most thorough appreciation of the intensive energy, kindly tact and effective persistence he has displayed, not only in making a great state record but in the multidunous labors incidental to the exploitation of our present journey, in the face of many difficulties.

"I wish also to compliment Mr. Baird upon the manner in which the Death Benefit Fund has been handled, he having had the principal burden of adjudicating claims—a most delicate matter.

"Our Memory's Friends.—To-day some who, a year ago, added sunshine to our lives and wisdom to our councils are, from the Thither Land, smiling down upon us a loving encouragement in our efforts for the promotion of the world's happiness. I would suggest that we devote a later hour to expressions of our sincere regard, and that we now rise for a moment's silent tribute to those who have preceded us but a few brief years into the Great Unknown."

(All those present then stood for a moment in silence).

"And now, my brothers and friends, I wish to say, in closing, that after a year as Supreme Snark and from observations of conditions and sentiment in many states, I have come to the conclusion that no mere plan of action will assure healthy growth or even the retaining of our present status. What gave the order its original impetus was earnest, kindly, brotherly personal effort on the part of its members, and unless the work of our officers is thus supplemented we shall fail. If each Hoo-Hoo would make it his pleasureable duty to obtain one sterling member during the coming year, the results would be tremendous. But the fact is that we are losing, in this mercenary, money-grabbing age, our old-time spirit of genuine friendship and cordiality, and our kindlier sensibilities are being blunted by the selfish pursuits that absorb, seemingly, our every faculty, and we are seeking the fruition of our desires in the worship of inferior gods instead of in an endeavor to promote the happiness of our fellow men. Unless we can eliminate this from our souls and labor earnestly for the common good, Hoo-Hoo or any other order based upon altruistic principles and ideas will fail. This is as irrevocable as Fate. Let us, then, this coming year, resolve that we will, by kindly counsel and earnest personal work, assist our often soul-weary officers to make this order a successful benefaction to mankind."

The report of the Scrivenoter for the year was then presented showing receipts of $40,908.76 and a balance on hand of $3,716.87. The record of the year's work showed 82 concatenations held and 1,175 regular members initiated.

The Death Emergency Fund

The report of the Death Emergency fund for the year was next presented showing that two calls had been issued since the inception of the fund. The disbursements from the inception of the undertaking to the close of business on September 6th, 1911, included the payment of 32 death claims amounting to $8,000. The total receipts for the period amounted to $13,601.59 and at the close of business on September 6th there was a balance on hand of $4,211.43. In submitting the report the Scrivenoter said in part:—

"A number of participants, in remitting on Second Call, have remitted in advance for Third Call. A few members remitted in advance for Second Call when responding to First Call. All these advance payments have been credited to Third Call. In addition to this all subscriptions received since Aug. 18 last have been credited to Third Call in anticipation of the early issuance of that call. It has been suggested that the Third Call be sent out coincidently with the first notice of 1912 dues, which will effect a saving of over $300, assuming that Third Call, as in the case of preceding calls, is to be sent out under two-cent postage. These payments made in advance on Third Call, and the subscriptions I have thought proper to voluntarily credit to that call, so as not to tax participants with payment for indemnity of only a few weeks, makes up a further sum of $110 which is not included in above statement of receipts.

"It is gratifying to be able to state that the Hoo-Hoo Death Emergency Fund has worked out in remarkably close fulfillment of the predictions made by The Bulletin when the first announcement was put before our members, namely, that the death rate would approximate eight per thousand per annum if we secured the participation of five thousand members. With less than average of four thousand responding to the two calls that have been issued, and with the fund working smoothly and successfully for a period of twelve months, we have had thirty-two death claims to accrue, have paid thirty-two of these without defalcation, default or delay, and are in position to pay the remaining two and still have $3,711.43 to the good with not a cent of indebtedness."

Report of Supreme Representative

Supreme Representative W. H. Stephenson, of St. Paul, submitted a lengthy report, of which the main points were as follows:

"I spent a good part of last year in the eastern states endeavoring to awaken new interest there, but regret to report that my efforts were not as successful as we had expected. Acting upon the suggestion of the Snark, I discontinued my work in the eastern territory. I, however, believe that with proper effort we can build up the membership in the eastern states, but it will take both time and money to do so.

"I have attended twenty-four concatenations as follows: Wichita, Kan.; Cumberland, Md.; Baltimore, Md.; Little Rock, Ark.; Indianapolis, Ind.; Terre Haute, Ind.; Kansas City, Mo.; Des Moines, Iowa; Wasau, Wis.; Winnipeg, Man.; Hamilton, Ont.; Bay City, Mich.; Grand Rapids, Mich.; Columbus, Ohio; Hinton, W. Va.; Buckhannon, W. Va.; Huntington, W. Va.; Wilmington,

N. C.; Greensboro, N. C.; Asheville, N. C.; Waco, Tex.; Quincy, Ill.; Roanoke, Va.

From this you will note I have attended concatenations in the jurisdiction of all members of the Supreme Nine with the exception of Junion Hoo-Hoo Griswold and Bojum Russell.

With the exception of Ohio, Massachusetts, New York and Minnesota I found the members of the order awake and full of interest and wanting more concatenations held.

"I believe that the expense incurred in my office has been more than justified and that it is necessary to have a representative who can visit the different states and assist the Vicegerent Snarks in working up concatenations and keeping the members in line.

I have met with a hearty welcome at all places and the members have done everything they could to make my visit result in good to the order. The members seemed glad to have me with them and approved of the plan of having a Supreme Representative.

Below I give, for your consideration, my suggestions for future work. These suggestions are based on my conversations with members of the order and I believe are for the best interest of the order.

Annual Meeting.—I would recommend that our annual meetings be held in either June or July, the Hoo-Hoo year to remain as it is, from September 9 to September 9. This would give the newly elected officers a chance to become acquainted with the duties of their several offices and enable them to get the new Vicegerents appointed and ready for action on September 8. The meeting as it is now held is in a bad month for lumbermen to get away, as fall business commences in September. And there is a reason greater than these: September is late in the season and the larger part of our members have been away on their vacations and do not feel they can affard the time for another trip. If we select some date in June or July and hold our meetings at some central attractive point, we will get a much larger attendance, as our members can arrange their vacations better earlier in the season. The officers could make a partial report and the final reports for the year could be published in the Bulletin for September of each year.

"The Bulletin.—I would recommend that the Bulletin be devoted to Hoo-Hoo affairs and an effort made to get the members to contribute articles thereto relating to the order in different sections, etc., and more space be given to the concatenations and to the Vicegerent Snarks. I offer for suggestion and discussion, but personally do not recommend , the question of acception advertising matter in the Bulletin, no advertisement of any liquor to be accepted or any advertising that would conflict with the lumber trade journals. We have a large circulation and could no doubt make the Bulletin self-supporting in this way.

"Handbook.—I would recommend that we print the handbook each year and that it be mailed to each member in good standing. The present method of sending the handbook only to old members upon request has not worked out to the best interest of the order. I would suggest that we eliminate from the handbook the membership list by numbers and simply show the names alphabetically and by states and cities. This will reduce the size of the handbook and save considerable expense in getting it out. Every effort should be made to have the handbook corrected to date and keep it so.

"**Vicegerent Snarks.**—We can not exercise too much care in the appointment of our Vicegerent Snarks. Most of our trouble has been caused by the appointment of Vicegerent Snarks who did not have and ought not to have the support of the most prominent lumbermen and our members. No Vicegerent Snark should be appointed until the officers have satisfied themselves that he is the proper person for the appointment and that his appointment will give satisfaction to the larger part of the membership in his territory during the Hoo-Hoo year. Two or more concatenations should be held and certainly no one should accept appointment unless he is willing to hold at least one cancatenation. It is far better to have no Vicegerent Snark than to have one who does not command the respect and assistance of the members.

"Concatenations.—At least two concatenations should be held in each district each year. This is necessary to keep the members together and interested. This can be done if the members will give their assistance to the Vicegerent Snark. I find the great trouble is in the expense of a concatenation. No Vicegerent Snark is willing to go ahead and arrange for a concatenation unless he has the support of the members, and the members should be given to understand that it is just as much their duty as it is the duty of the Vicegerent Snark to work up and arrange for concatenations. The expense incurred at concatenations is greater than it should be and the trouble seems to be that each Vicegerent Snark and each district seems to try to outdo the others. Let us get down to bedrock and go back to the simple session on the roof, as we intended. The larger number would prefer this to the banquet. I would suggest also that the members be told through the Bulletin that they must expect to come to the front and assist the Vicegerent Snark in case there is any shortage. Let the Vicegerent submit to the concatenation his expenses and I am sure that the members will come to the front. The trouble is, some Vicegerents seem afraid to do this. Let us give the matter publicity, so that no Vicegerent will feel embarrassed in asking for help. Let us impress upon the Vicegerent that he must be careful in his expenses and hold same down to the lowest possible amount.

"The so-called "Dutch lunch" is, to my mind, far better than the banquet and we should do all we can to encourage the Vicegerents to go back to the simple way. Every concatenation must be self-supporting, as the order can not in justice to itself help out on expenses incurred at concatenations. We allow half of the initiation fee and, if this is not sufficient, the members must make up the shortage, and it is not right or fair that it should fall upon the vicegerent. Each member present should contribute his share. If the Vicegerents knew that the members understood that they were to help out on the expenses of concatenations, I believe it would result in more concatenations being held. Give this publicity in the Bulletin in such a way that it will come to the attention of the members.

"Imminent Distress Fund.—I find that this fund is not understood by our members in general and would suggest that a yearly call be made about Christmas time and a circular be sent with the call fully explaining just what this fund is for and how used. It is a voluntary fund and no member can object to the call. If the fund is properly used it can be made of great benefit to the order. I believe that the members who understand the purpose, and the other members upon explanation of the fund, will want this work continued and will be glad to contribute to it, if they know it is being properly used. I would recommend that the list of contributors be not published, but that a complete list be kept by the Scrivenoter at his office for the information of the officers and any members desiring same. The receipts and disbursements of this fund should be published in the Bulletin each year, giving the totals. No names should be published. Information in regard to whom relief has been furnished should be given by the Scrivenoter to any member asking for the information, no disbursement to be made without the approval of the Snark, Senior Hoo-Hoo and Scrivenoter.

"Lumber or Trade Publications.—We should cultivate a closer relation with all lumber and trade publications and should furnish them promptly and regularly with trade news. From my experience with these publications, I believe they will gladly give us space if we furnish them news items promptly. The order owes more to the lumber newspapers than it can ever pay and we should do all in our power to see that they are furnished with news items regarding concatenations and other items of interest to the order and the members thereof.

Scenery for Embalming the Snark

I would recommend that the order sell or dispose of the scenery etc., it now owns for the purpose of embalming the Snark, as the expenses of storage and transportation are greater than results so far have justified.

"There are several reasons for the decrease in the number of men initiated this year, as compared with previous ones, the principal one being because of business conditions in the lumber trade.

"If we will all pull together with the sole aim of the good of the order, we can accomplish great good to the lumber and allied interests and make life a little pleasanter for the individuals engaged therein. Let us endeavor to make Hoo-Hoo such an order that instead of having to go after candidates they will come to us and consider it an honor to be received as a member. Let us guard the ballot box carefully and keep out the unworthy, and when we find one already in the order, let us be men, and for the good of the order expel him promptly.

"I desire to thank the members of the House of Ancients, the Supreme Nine, all Vicegerent Snarks and the individual members of the order for their cordial assistance and support during the year. I would like to name personally all the good men, but as this is impossible think it best to name no one personally.

"All the members of the Supreme Nine this year have labored hard for the good of the order and are entitled to the heartfelt thanks of every member.

"My relations with the Supreme Nine have been most pleasant and I would not be true to myself or the order did I not extend my personal thanks to Mr. Miller, Snark; Mr. Webb, Senior Hoo-Hoo, and Mr. Baird, Scrivenoter, the three officers with whom I have been in close touch all year, and for their kindness to me personally and their valuable assistance and interest and hard work, for the order. I have called upon them often, but have never found them wanting."

Good of the Order

Morris A. Hayward, chairman, presented the report of the committee on good of the order as follows:

"As suggested in the address of Snark Miller, and also advised by Supreme Representative Stephenson, we recommend that the Annual meeting take place some week in July, after the Fourth of July.

"We recommend that no change be made in the constitution or by-laws relating to the use of alcholic stimulants, either in the anteroom during concatenation or at any of the functions at this particular concatenation.

"We recommend that, on account of the shrinkage in our funds in the treasury and the large shrinkage in our membership, the office of Supreme Representative and the Supreme Scrivenoter be embodied in one and that his entire time be devoted to the interest of the order, and we further recommend that in answering calls from remote distances he do so only by a majority vote of the Supreme Nine; and we further recommend that state meetings be called for the gathering together of old and new members, having in view the reinstatement of delinquents and that the work be prosecuted along these lines, rather than that of securing new members.

"Regarding the reinstating of delinquents: that they shall be required to pay up all past dues to the amount of $5, and if delinquent refuses to comply that he sign a withdrawal card surrendering his number and button.

"We recommend that the names in handbook be printed only alphabetically by states, cities and towns, and that all honorary and life members show as such, and furthermore that there shall be no new publication of handbook except by order of the Supreme Nine, but that supplements be issued the first and seventh months of each year, and the manner of printing, whether by the old type or linotype, be taken into serious consideration.

"We recommend that there be no change made in dues at this time.

"We recommend not only the continuance of the Bulletin but that a ladies' department be added, contributions to be received from the wives and daughters of the order.

"We recommend that there be an auxiliary to the order of Hoo-Hoo, composed of the wives, mothers, daughters and sisters, under an appropriate name, to be decided by themselves, their constitution, by-laws and dues to be decided upon in their order.

"We recommend that the official button be reduced to the size of the present ladies' pin and that the emblem of the auxiliary order be the same."

Minority Report

C. H. Adams, of the committee, also presented a minority report as follows:

"Your committee, being unable to agree in some particulars, this minority report is respectfully submitted:

"That portion of the majority report excepted to is that prescribing that the Scrivenoter shall devote his entire time to this order. In the judgment of this minority, to employ a man capable of properly, promptly and efficiently adminstering the financial and clerical conduct of the order's business and to devote his entire time to such work, would require that a salary be paid much larger than that now paid the Scrivenoter; that no beneficial results whatever would follow and that practically all the heavy expenditures now complained of would be continued. Unless we are to continue the experiment of having a traveling representative go about the country to supervise the conduct of cancatenations, this order needs the entire time of no high salaried official for the proper conduct of its business.

"In the judgment of this minority, the experiment of a traveling, salaried representative during the last twelve months has proved anything but satisfactory. We have spent nearly $6,000 on that experiment and have held fewer concatenations than last year, not any more satisfactory concatenations than last year and have actually initiated nearly 400 fewer members. In the judgment of this minority we want no further experimentation or expenditure of the order's money along the line of a traveling salaried representative, it being the duty of every officer of Hoo-Hoo to attend every concatenation, if possible.

"In the judgment of this minority committee, what this order needs is a central executive office, where its financial and clerical work may be conducted with the accuracy, fidelity and expedition that the present arrangement has afforded for som any years.

"In the judgment of this minority this order neither needs nor wants any further radical experiments. In the judgment of this minority the present arrangement, so far as the Scrivenoter's office is concerned, should not be changed.

"With all the remainder of the majority report this minority concurs."

The majority report was signed by M. A. Hayward, Thomas Patterson and J. J. Kress. The minority report was signed by Charles H. Adams and E. B. Holmes. After considerable discussion a vote by states was taken upon the question of substituting the minority report for that portion of the majority report to which objection was made. The minority report won by a majority of 7,760 to 5,668, disregarding fractions.

The majority report was then taken up, section by section, and was considerably disfigured by amendment and rejection. It was decided to leave to the Supreme Nine the matter of time and place of meeting, with the understanding that the meeting be held in the summer months.

It was pointed out that the recommendation regarding reinstatement of delinquents, and recall of button and handbook in case they declined to be reinstated, was already provided for in the constitution.

The clause providing for changes in the handbook was rejected.

The suggestion for the organization of an auxiliary to include the wives and daughters of members was carried, after being amended to include mothers and sisters. The recommendation as to the size of the official button was so amended as to provide for two official sizes, the present button being retained, but a smaller size being optional where members might prefer.

Tuesday Afternoon Session

The report of the committee on constitution and by-laws was presented by W. E. Barns, secretary. It recommended adding a new section (5) to article 4, a provision that the chief working executive officer shall be the Scrivenoter, who shall devote his entire time and attention to the work of his office.

As section 6 of the same article it was recommended that the office of Scrivenoter shall be located in Chicago.

The committee further recommended to change the date of meeting, so that it should occur on the second Tuesday of July; but that the ninth day of the ninth month shall still be regarded as the beginning of the Hoo-Hoo year and that the newly elected Supreme Nine shall hold a meeting on that date. The committee also recommended eliminating the provision in the constitution for the employment of the Supreme Representative.

Taking up the recommendations individually the section relating to Supreme Representative was by vote abolished, but Mr. Baird at once served notice that he had voted in the affirmative for the purpose of moving a reconsideration later.

The section relating to the duties of Scrivenoter and location of his office next came up for consideration and evoked considerable discussion, as it raised the point around which most of the politics of the annual meeting had revolved. One of the most illuminating talks was made by R. D. Inman, who spoke in part as follows:

"For several different reasons I feel it my duty to speak on this question at this time. I am speaking simply from an extreme western standpoint; not being familiar with conditions in the East or South or central sections. There seems to have gotten into this an idea among a good many of the brethren that this movement was for the displacement of our present Scrivenoter, Mr. Baird. Let me say to you that I would hate badly to see him defeated. I have always liked the man for his integrity and his honor and as long as these gentlemen do believe that this is an attack upon Mr. Baird personally I admire them for the stand they take. The question of having a representative who would give his entire time to the business of Hoo-Hoo has been in my mind for a number of years, and I have always believed the time would come when it would be carried out. I believe the sooner it is carried out the better it will be for this organization. Where in any other organization can you find this same state of affairs I don't expect this thing to carry now, but it is an entering wedge to the future. It has got to be done sooner or later, or this organization will disintegrate. Mr. Baird has done the best he could. You all admit that. On the Pacific coast,, I don't mean to state that it is a universal sentiment, but the leading men have advocated that same thing, but of all I have talked with there has never been a man who indicated to me that this is a personal matter. I do not say that it is not with some. I cannot go into the hearts of others and determine their motives. But you must remember that the time is coming when there has got to be more done for Hoo-Hoo. The past year has been a bad year. That is the fault of all of us. It will continue to be our fault if we continue to take wrong action in legislating in the affairs of Hoo-Hoo. We have got to give this consideration outside of any individual."

A vote was then taken upon the proposition, showing 6,354 votes for and 7.402 votes against the recommendation of the committee, fractions disregarded.

The recommendation of the committee as to time and place of annual outing and business meeting was adopted, after having been amended by J. Newton Nind so as to leave the date an entirely flexible one, subject to the discretion of the Supreme Nine.

A motion being offered and seconded for the adoption of the report as a whole, as amended, Mr. Baird interposed and read secedtion 6 of article 4, relating to Supreme Representative, and then spoke as follows:

"Gentlemen of the Concatenated Order of Hoo-Hoo: I opposed that very proposition for fourteen years. When it came up here I voted aye and served notice that I did so for the purpose of moving reconsideration. I want that clause to remain for the good of the Order. I am now making a personal appeal. I understand that it is being used as an argument against me, that I have so many other things to distract my attention; and it is stated that in addition to a trade newspaper I own a farm, an automobile, several stallions, etc. I own all those things, and some that have escaped the attention of my chosen friends. It is not my purpose to speak with undue warmth or utter any single word of recrimination. For fourteen years I opposed this thing, but it appeared to the majority last year that it was the proper thing for Hoo-Hoo to do and it was adopted. Now, only after one year's trial under adverse conditions, there are men who voted for it who come along and say to this man, "We are going to put you out of your job." I am here to say to you that rightly handled there is a field for this man. He is a man of integrity, ability, culture and refinement—a man of impressive personality. I am making this personal appeal because it is the last year that I will be able to serve you as Scrivenoter, because my stallions have become so numerous, my automobile so troublesome, my farm so extensive, my other duties so numerous that no longer will it be possible. I want to leave this order in good shape. I want during the next twelve months to hold 125 concatenations as we did under the inspiration of our old friend Norris, of Texas. I want to appeal to all you young fellows whose future is before you to give Mr. Stephenson another year of trial in the service of Hoo-Hoo and I ask you to support my motion for a reconsideration."

The motion was seconded by T. L. O'Donnell and duly carried. The report of the committee as amended was then adopted as a whole.

There was some general discussion of the death emergency fund, finally resulting in the adoption of a provision that upon a member's first contribution to the fund his eligibility to benefits should not begin until sixty days later, excepting only in case of death by accident.

Tuesday Evening Session

A communication from the ladies of the party was then read. It was a cleverly worded declination of the suggestion that an auxiliary organization for the ladies be formed, suggesting that it might possibly lead to political rivalry and strife. They also requested that the records be cleared of all reference to this matter, and upon motion this was done.

Newly Elected Officers

R. W. Neighbor, chairman of the committee on nominations, reported that the committee had endeavored to secure men who had distinguished themselves by their activity for the good of the order and men who would be acceptable to the body of its membership. It offered the following list of candidates:

Snark—E. Stringer Boggess, Clarksburg, W. Va.
Senior Hoo-Hoo—J. F. Judd, St. Louis, Mo.
Junior Hoo-Hoo—F. W. Trower, San Francisco, Cal.
Bojum—T. Patterson, Hamilton, Ont.
Scrivenoter—James H. Baird, Nashville, Tenn.
Jabberwock—J. M. Leiter, Portland, Ore.
Custocatian—T. L. O'Donnell, Sanford, Miss.
Arcanoper—J. C. Ray, Waco, Tex.
Gurdon—W. T. Carroll, Uniontown, Pa.

The report was signed by the entire membership of the committee, as follows: R. D. Inman, George Youle, Harvey Avery, J. B. Nalty, Charles Walker, R. S. Cornelius, Frank Colpetzer, D. Richardson, R. W. Neighbor.

All these officers were duly elected separately, the Scrivenoter being instructed to cast the ballot of the convention for each. Upon the election of the new Snark he was conducted to the chair by Jeff B. Webb and Harry J. Miller.

Others of the officers were also conducted forward as elected and were called upon for brief speeches.

The Newly Elected Supreme Snark

Regarding the new Snark the following appreciation is reprinted from The American Lumberman:

Edwin Stringer Boggess, 7197, needs little introduction to Hoo-Hoo anywhere, as the eleven years of his membership have been years of useful service to the order. Initiated at Baltimore, Md., March 7, 1900, he has been a familiar figure both at concatenations anywhere within his territory and at the annual meetings, and twice has been a member of the Supreme Nine, as Custocatian and as Jabberwock.

Mr. Boggess was born March 7, 1858, at Lumberport, Va., now a part of West Virginia, within nine or ten miles of his present residence. It will be noted that the concatenation which numbered him a Hoo-Hoo also celebrated his forty-first birthday. His father was a civil engineer and surveyor, but the son, after completing his local school education by a course at Maryland, college, engaged in the lumber business in 1883, operating a saw mill in connection with Col. Floyd Neely, in West Virginia. Later he went on the road as buyer and inspector for Price & Co., Clarksburg. Subsequently he became a member of the firm, and after six or seven years succeeded to the business, which recently has been incorporated as the E. Stringer Boggess Company, making a specialty of export hardwoods.

Mr. Boggess is a very genial man, one with a host of friends and very few acquaintances who are not included in the other description. He is a man of enthusiasm and energy, with a mind vivid with inagination and hope and yet capable of concentrated drudging effort. In the plan which has been announced to make this a banner year for Hoo-Hoo and again fling its banner challengingly to the highest breezes, the Supreme Snark will be found at the front, calling the rank and file to "come on."

Among those present at the annual meeting from Canada were Mr. Thomas Patterson, Mrs. Patterson, and her two daughters, of Hamilton; Mr. Fred Taylor, of D. Aitcheson & Company, Hamilton; and Roy Stewart, of the Long Lumber Company, Hamilton.

Practical Forestry Instruction

Foremost among the institutions of education which are promoting the scientific study of forestry and lumbering is the Yale Forest School of Yale University, New Haven, Conn.

The department was organized at the suggestion of lumber manufacturers, who felt that forestry instruction up to that time had been devoted to technical forestry, without sufficient regard to its economic relationship to the actual business of lumbering; and a chair of "Applied Forestry and Practical Lumbering" was endowed by subscriptions from leading lumbermen in the United States.

One after another of the leading universities and colleges of the United States and Canada are establishing courses or departments in forestry. It would be well if the lumbermen in the localities interested in these schools should see to it that a practical turn is given to this work so that graduates might go out equipped with a knowledge of the relationship of their theoretical studies to business. Studies of forest botany, tree diseases, etc., are important, but their application must be in a practical, economic way if they are to be of any real service; and in this respect the Yale Forest School is, at the instance of lumbermen, setting an example which should be followed, if not improved upon, by the institutions which are educating the young men at the direct expense of the tax payers.

The instruction in lumbering proper is conducted by a lecture course for senior students given in New Haven from October 1st to March 1st, and by practical field work in the south from March to the middle of June. An idea of the practical nature of the work of the school is afforded by the following list of subjects which are among those taken up:—1. Importance of the industry in the United States, brief historical review of its development, statistics of the industry, the future of the industry. 2 Planning a logging operation, methods employed, data required and methods of obtaining it. 3. A comparative study of the methods of, and equipment required for, logging operations in the various forest regions. This covers all sorts of tools, vehicles, and machinery used in handling logs from the stump to the railroad or water. 4. Transportation of timber and other forest products by land and water. Methods, equipment required, value of each system. 5. Detailed study of logging methods in special regions. 6. Log scales, scaling practice, and log grades used in different regions. 7. Types of manufacturing plants and equipment used. 8. Methods of manufacture. 9. Theory and methods of seasoning lumber. 10. Preparation of lumber for market in planing mills. 11. Methods of sale—trade customs. 12. Lumber grades and grading methods. 13. Lumber associations—objects and work. 14. Foreign and domestic markets. 15. Timber bonds. 16. Insurance for saw mill plants and timber. 17. Lumber tariff. 18. Cost-keeping methods. 19. A brief course treating of shingle, lath, clapboard, veneer, cooperage, vehicle stock.

Canada formerly did quite an export trade in hemlock bark to the United States, but this has steadily declined since 1877, when the maximum (81,991 cords, valued at $355,208) was reached. During the fiscal year 1909-10, the export of hemlock bark amounted to 19,659 cords, valued at $122,118.

Sawmills of the Northern Shore

No. 6.—Waldie Brothers Limited, Spragge Ont.—Modern Equipment and Efficient Management—150,000 ft. per day

Among the numerous saw mills on the Georgian Bay and the better reputation for the quality of their product than that of Waldie Brothers Limited at Spragge, Ont. The mill is furnished with a splendid equipment which enables it to turn out about 150,000 feet of lumber in a ten hour day.

The sawing equipment includes two double cutting Waterous band saws and a Wm. Hamilton gang saw, in addition to a gang edger. This is a most useful machine with Simmonds inserted teeth and is used for cutting the four and five inch cants. Two lath machines are operated which were manufactured by P. Payette & Co., of Penetanguishene, Ont. The power for the mill is furnished by six Waterous boilers of the latest improved type with Dutch ovens. The output of the company is largely white pine with a small amount of red pine.

Saw Mill of Waldie Bro's. Limited, Spragge, Ont.

View of Shipping Dock—Waldie Bro's. Limited, Spragge, Ont.

The lath mill and bolter in this mill is one of the best machines turned out by P. Payette & Company, of Penetanguishene. The bolter is their well known No. 1, all iron frame, bolter, with four saws, and the lath mill is their five-saw No. 2, all iron frame. On these machines P. Payette & Company last year made a record lath cut of 128,350 laths in ten hours. Among the balance of the machinery in the Spragge mill is one of P. Payette & Company's latest patent mill dogs, which dogs equally well in frozen or wet timber.

The mill of Waldie Bros., Limited, at Spragge, was purchased by them some years ago from Cook & Bros. Lumber Company. The machinery in the original mill was all built by Wm. Hamilton Company, Limited, of Peterborough, who have also supplied much of the machinery which has been installed since its erection. In addition to the large gang saw built by the Wm. Hamilton Company, which has already been mentioned, they recently installed on their carriage a four-inch steam set works, one of the latest and most important improvements in sawmill machinery.

The limits of the company are located on the Serpent River and the head logging office and store houses are at Blind River.

The officers of Waldie Brothers Limited are as follows:—President, F. N. Waldie; vice-president, R. S. Waldie; secretary, G. E. Clemens. Mr. J. Duckworth is manager of the mill with Mr. Charles Carmichael superintendent and Mr. Thomas Lumsden, chief engineer and machinist.

A description of the operations of the Victoria Harbor Lumber Company Limited, which is also owned by the Waldies, was published in The Canada Lumberman and Woodworker on July 1st.

Forest Protection in British Columbia

Mr. H. A. Maclean, K.C., formerly deputy attorney general for British Columbia, appeared recently in behalf of the Province before the railway commission, in connection with an application having an important bearing on the protection of the timber areas from bush fire waste. As a very large percentage of the forest fire loss of British Columbia is attributable to sparks from locomotives and the operation of railway trains in general, it is being urged upon the railway commission by the forestry branch (for whom Mr. Maclean has been acting), that systematic patrol of the railway lines should be made obligatory by the commission which virtually controls all railways now operating in British Columbia.

The experience of the other Canadian provinces was cited by Mr. Maclean as indicating that the only way by which an end may be made of railway line fires is by the establishment and maintenance of patrols behind each train. A rule of this nature has been found in Ontario to work out most advantageously in practice; and in that province during 1909 no fewer than 187 fire wardens were thus employed during the danger season, at a cost of $66,172, which amount was subsequently proportionately refunded by the several companies.

The Ontario practice is to assign two wardens, together, to a beat of ten miles, these following up all trains. In British Columbia, it is contended, there is especial necessity for a similar patrol along the railways. The dry season being a long one, our forests large and valuable, and the percentage of fires attributable to railway locomotives a very appreciable factor in the total.

A suggestion by Chairman Mabee of the commission that the railways were probably held blameless for more than their due share of forest destruction was promptly answered by Mr. Maclean from the recorded statistics.

The final outcome of consideration of the application and related questions was a request from Chairman Mabee that the provincial authorities present in concrete form their proposal as to the amount of patrol necessary and requisite along the various railway lines in the province, at the same time drafting and describing the areas to which, in the opinion of the province this patrol system should apply.

The forestry branch has already begun the preparation of this important memorandum, and upon its reception copies will be furnished to each interested company and the railway commissioners will hear what they have to say upon the proposals advanced and the regulations submitted. Direct and specific investigation by the commission will follow, if there is—as it is most probable there will be—any conflict of view between the province and the roads, which regulations will have the effect of law.

Douglas Fir Statistics

Some 35,000,000,000 feet of Douglas fir lumber has been manufactured in the last ten years, and the recent cut is approximately 5,000,000,000 feet per year, or 11 per cent. of the total lumber cut. Since 1880, Oregon and Washington have produced 80,000,000,000 feet of lumber, nearly all of which was Douglas fir. Some eight or nine million Douglas fir railroad ties are laid annually, and for piling, bridge timbers, mine timbers, boat building, and a multitude of other uses, Douglas fir has little competition from the Rockies to the Pacific, while 60 per cent. of the cross-arms bought every year by the telegraph and telephone companies are of this wood. The present utilization of Douglas fir is light compared with what will come in ten or fifteen years with the greater exhaustion of the southern pines, the exploitation of which is now at its maximum. Complete and accurate tests by the United States government state that Douglas fir and longleaf pine are practically equal in strength, with the decided advantage of 20 per cent less weight in favor of Douglas fir, and that, excepting longleaf pine, no other structural timber of general use in the United States is as strong as Douglas fir.—R. S. Kellogg.

Logging Operations on St. John River

Further Description of Methods Employed by Log Driving Association—System as Applied to a Gigantic Work—Outline of Company's History

Lewis H. Bliss,
Secretary-Treasurer and Manager.

A short illustrated article upon the operations of the St. John River Log Driving Association was published in the "Canada Lumberman" of September 1. We take pleasure in supplementing this description with a few more views and further descriptive matter.

For over a century the waters of the St. John River have carried logs from the forests to the sawmills. In the earliest days of the lumbering industry the pioneers cut their own timber, hauled it to the river and rafted it themselves. In the course of time the extent of the lumber industry increased and co-operation was found to be not only advisable but necessary. Under the old system, the driving of logs became increasingly difficult and expensive. A time came when immediate relief was essential and then occurred the birth of the St. John River Log Driving Association. The first record of the company's operations deals with the building of the booms by J. & S. Glasier some time about 1880. The rafting operations carried on by the Glasiers was of a very primitive nature, the work being carried on entirely from the shore, as shown by the accompanying illustration.

Shortly after this the Fredericton Boom Company was formed, which continued its operations on the river for some years, and was replaced in 1886 by the St. John River Log Driving Company. Legislation was secured from the Province of New Burnswick, and from the State of Maine, giving the Association exclusive right to drive logs on the St. John River. The rates to be charged for their services were fixed by the Legislatures. The Association continued under this arrangement for a number of years, but finding that they could not make it pay with the standard of rates permitted they suspended operations. In 1907 the legislature of New Brunswick granted them the privilege of fixing their own standard of rates. The company then again commenced operations.

The St. John River Log Driving Association as it exists to-day, controls all log driving operations upon the St. John River, being the only company which has permission to drive on these waters. Their head office is located at Fredericton, and they have also established there a small factory for the manufacture of such wedges and tools as are needed in the company's operations. Three miles up the river, at the town of Douglas, and 7 miles down the river at Mitchell are located the company's booms.

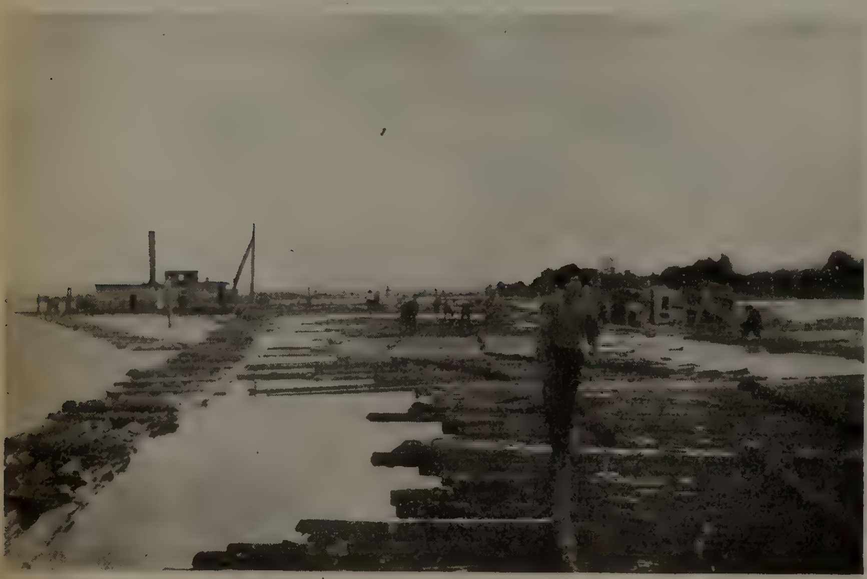
The members of the St. John River Log Driving Association are lumbermen whose limits are located on the river or in its vicinity. Anyone who cuts 100,000 square feet of timber in a season may become a member, while the rates are fixed according to the actual cost of operating. The company's officials are all experienced lumbermen. The general manager, Mr. Lewis Bliss, has been connected with the lumber industry since his boyhood, and is credited with being one of the best posted men in the lumber industry in America to-day.

Foreman Kimball,
at His Home Near the Boom.

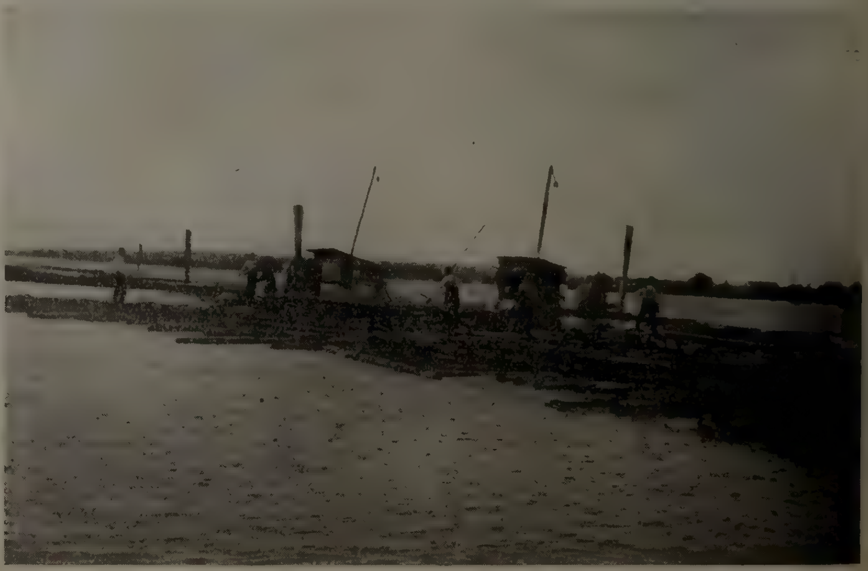
The operations of the company have all been developed by him, and it is due not only to his experience but to his originality that the company has been enabled to carry out the rafting of its logs in such a unique and successful manner. The system as developed by Mr. Bliss is considered to be as nearly perfect as possible for the rapid handling of large drives.

The first impression which a visitor obtains upon approaching the boom at Mitchell is of an immense log jam. For over three-quarters of a mile the river is covered with a great mass of logs, on top of which the men are to be seen skipping about at their work. In the face of such an unorganized jumble of logs, one would expect that it would be practically impossible to adopt any systematic method of work. But system is really the basis of the whole of these interesting operations. Everything works along with the utmost harmony, each man being appointed to his own particular work and station, and each log ultimately finding its way, with the least possible delay, to its own proper pocket.

The diagram shown in the accompanying illustration indicates the method of work at the Mitchell boom. A long boom (A) stretches from the shore to the first point of operation. After the logs leave the sheer boom they float down to the opening at (B), where are stationed the men who are known as "rollers." These men hold on to a wire cable stretched breast high and as the logs come down they turn them over with their feet until they find the owner's initials. One of the rollers holding a gouge-like knife marks each log with the proper sorting mark, as soon as the owner's initials have been found. In this way the sorters are enabled to draw the logs into their special pockets. The work performed by the rollers is extremely arduous and they are obliged

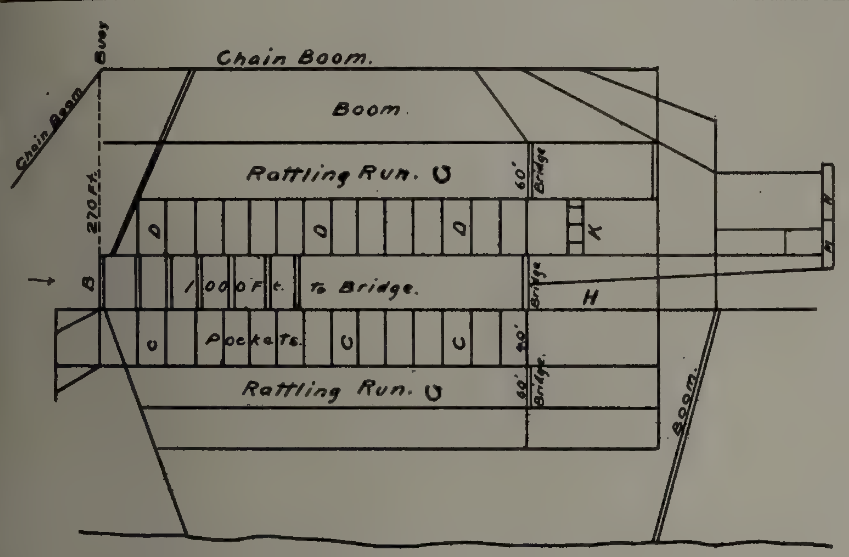


St. John River Log Driving Operations—"Enders" at Work.



St. John River Log Driving Operations—Making Up Rattlings.

to relieve one another in relays lasting only for a half an hour at a time. From the rollers the logs pass to the main channel the bridges (E). These bridges are placed every 20 feet across the channel. Upon them men are stationed to direct the logs into their proper pockets (C D), according to the marks upon them In the pockets the logs are tied together in the rattlings and floated down the run (G G) to the loading grounds (H). Here two long timbers are rolled down upon them from the shoot (K) and the "enders" with axe and auger soon fasten them with hardwood pins to the end logs. Next they are floated to the loading machine (M). The loading machine consists of two heavy chains fastened at one end upon a floating table. The other ends are attached to a long wooden block which travels up a steel cable and is controlled by a steam driven winch on the scow (N). When the block is down the chains are submerged. Four of five heavy logs are then floated over them and the rattlings are drawn up on the floating table. When the block is drawn up the logs are loaded on top of the rattling, their weight holding it down and preventing the loose logs from floating free. Then the rattling is finished and floating down to the surveyors, which after measuring, turn it free to the tow company's tugs. The tugs form the rattlings into large rafts and tow them away to the various mill owners.



St. John River Log Driving Operations—Diagram of Booming Ground.

The great extent of the St. John River Log Driving Association's work may be realized when it is considered that over 400 men are employed at Douglas and Mitchell. The boom at Mitchell alone handles a million feet a day or between $12,000 and $15,000 worth of lumber. The opreations at Mitchell are under the direction of Mr. Kimball who as foreman of the crew is responsible for its successful management. For over 25 years Mr. Kimball has been engaged in this work, having been one of the pioneer workers on the original Glasier boom.

The bodily comfort of the men who are engaged in the arduous task of sorting the logs is of the utmost importance, and it is due to the skilful and thoughtful management of Mr. Kimball that the men are so well housed, fed and generally cared for.

Pulpwood Export Ceases from New Brunswick

On October 1 the bill passed by the New Brunswick Legislature on April 13, to prohibit the export of pulpwood cut on Crown lands in the province comes into effect. The bill provides that "all sales of timber licenses" giving the right to cut "spruce or other soft wood trees or timber, other than pine and poplar" and "all licenses or permits to cut such timber" shall be "subject to the conditions set forth in Schedule A" of the Act, which may be cited as "The Manufacturing Condition."

Schedule A, referred to, provides that "every timber license or permit conferring authority to cut spruce or other soft wood trees or timber, not being pine or poplar, suitable for manufacturing pulp or paper, on the ungranted lands of the Crown shall contain and be subject to the condition that all such timber cut under the authority or permission of such license or permit shall be manufactured in Canada, that is to say, into merchantable pulp and paper, or into sawn lumber, woodenware, utensils or other articles of commerce or merchandise as distinguished from the said spruce or other timber in its raw or unmanufactured state."

If this condition is not observed, the license is to be suspended. The Surveyor General is given power to seize any timber which the owner is suspected to have the design of removing from the country, and retain it until the owner satisfies him that it is not the intention so to remove it.

The Act fixes the fee for the transfer of licenses at four dollars per square mile.

Maine Operators to Reduce Log Cut

The failure of the coastwise markets to take the usual quantity of Maine Spruce in the season of 1910 and thus far in 1911 has seriously affected the lumber trade and is given by loggers as one of several reasons why the cut on eastern Maine waters next winter will be from 25 to 40 per cent. less that last year's. Other reasons for the predicted curtailment are the hanging up of considerable quantities of logs in this year's drives, and the inability, by reason of drought, of many water-power mills to saw their usual quota. It is stated that many of the largest concerns have already decided to curtail operations at least one-third, and the smaller operators complain that with conditions as they have been in the last few years, there is much risk and little profit for them, so that they are not induced to "go in" very heavily this winter.

The Great Northern Paper Company, the heaviest operator on Penobscot waters, this winter, it is estimated, will scale its cut down to about 40,000,000 feet. The Eastern Manufacturing Company of Bangor, which usually gets 30,000,000 to 35,000,000 feet on the east branch, will probably get nearly or quite as many logs as usual, but William Engel & Company contemplate a reduction of their usual 15,000,000 feet cut to 10,000,000 or 12,000,000 feet. The sawmill of Lowell & Engel in East Hampden, one of the largest of the tidewater mills on the Penobscot, closed down September 5 and will probably remain idle for a month or more.

The spruce interests have moved along to the fall season in a materially stronger position than they have ever before attained, though this fact is not fully in evidence in the local market. The situation here is complicated by the pressure of Adirondack, Candian and West Virginia shippers to market their product here in face of a contracted demand, and this has worked squarely against the Eastern spruce for a period approximating three years. Con-

St. John River Log Driving Operations—The Old Glasier Boom.

St. John River Log Driving Operations—A Few of the Crew.

sumption of spruce in New England, however, has been of sufficient volume to fully take care of production, and not since the big slump during the spring and summer of 1908 has it been difficult to market a mill cut on a basis of $23 or better for frames 9 inches and under at Boston points. The spring market in 1908 was weakened by the financial panic in 1907, and the base price went below $20, but by August, 1908, it had worked back to $23. At present the market at Boston points is very firm at $24, and the records do not show that this figure was ever before reached and actually maintained as a market price. It was quoted for a period of about three weeks in July, 1907, but very few shippers booked actual orders at that figure. The market to-day is clearly defined at that base price, and where specially prompt service is required a premium can be secured over this figure.—The Lumberman's Review.

Annual Issue Widely Appreciated

Many Readers Express Approval

The reception given by readers of the Canada Lumberman to the Annual and Camp Supply Number which was published on September 1, was most encouraging. Many expressions of opinion have been received from our readers regarding the high standard which has been set by this special issue. It will be the endeavor of the Canada Lumberman in its future issues to live up to, and if possible to excel this standard. So encouraging were the opinions of some of our readers that it gives us a great deal of pleasure to reproduce a few of them herewith.

The Muskoka Wood Manufacturing Company, Limited, through their president, Mr. R. J. Hutcheson, writes as follows: "The special edition which I have examined is a credit to any publisher and will no doubt serve to prove to your many readers that the Canada Lumberman is to-day fully abreast of the times. It is an honor to the lumber industry to have a trade journal that can so ably represent them."

Shundler & Company, wholesale lumber dealers, 24 State Street, New York, write as follows: "The Annual and Camp Supply number of the Canada Lumberman is a splendid issue. We are proud to be represented among the advertisements in such a Canadian trade publication, and we appreciate the share of Canadian trade which we have already secured. We are working hard to get more."

Professor Hugh P. Baker, of the Forestry Department of the Pennsylvania State College, says: "Your splendid Annual and Camp Supply number has just been received, and we have gone over it with a great deal of interest. The paper will be of distinct help to both the department and our students."

The Sutherland Innes Company, Chatham, Ont., say: "the Annual and Camp Supply number of the Canada Lumberman is a very creditable issue. I will have much pleasure in forwarding copies to some of our English friends, who, I think, will appreciate the paper."

Mr. Charles McGibbon, of the McGibbon Lumber Company, Penetanguishene, Ont., says: "I am much pleased with the Annual and Camp Supply Nnmber of the Canada Lumberman. In my opinion it is the best number you have published.

Mr. H. R. MacMillan, of the Forestry Branch of the Department of the Interior, writes as follows: "Your special issue of the Canada Lumberman was, I believe, the best issue of a lumber journal got out in this country, up to date."

The Colonial Lumber Company, Pembroke, Ont., say: "We think the Annual and Camp Supply number of the Canada Lumberman is a creditable one, an issue that will be much admired and beneficial to your subscribers.

Norman Hocken, Otter Lake Station, Ont., writes as follows: "I consider the Annual and Camp Supply number of the Canada Lumberman and Woodworker a splendid one."

The secretary of the Canadian Lumbermen's Association writes as follows: "You have given the lumbermen of Canada something valuable to read and think about."

Mr. Henry Wise, the well-known lumberman, of St. Catharines, Ont., is on a trip to British Columbia.

A by-law will be submitted to the ratepayers of Dryden, Ont., on October 16th, authorizing the town to enter into an agreement with the Dryden Timber & Power Company, Limited, to sell Dryden Park to the company, to exempt them from taxation for ten years and to fix the rate of assessment of the company's property at $60,000 for ten years, in return for which pulp and paper mills will be erected.

Sudden Death of Edwin F. Simonds

It is with regret that we announce the sudden death of Edwin F. Simonds, vice-president of the Simonds Manufacturing Company, which occurred at Fitchbrug, Mass., in the early morning of September 8th. The cause of death was heart failure. The news came as a shock to his relatives and friends, as Mr. Simonds had seemingly been in the best of health up to the first of that week, and while he had been under the care of a physician for a few days, he was not considered dangerously ill.

Edwin Franklin Simonds was born in Fitchburg on October 22, 1849. During his boyhood he worked in the factory of his father, who was the founder of the business which later became the Simonds Manufacturing Company, and after his graduation at Worcester he immediately became associated with his brothers in this business.

Up to 1879 he was located in Fitchburg, becoming thoroughly conversant with the manufacturing end of the business. At that date he removed to Chicago to take charge of the growing affairs of the company in that section. This business started with a small store and under his very able management it was developed and increased to such an extent that in 1892 the erection of the present large factory was required. In 1900 the Chicago plant was still further enlarged by the building of a steel mill. Mr. Simonds remained in Chicago as manager until 1905, at which time he was elected as vice-president of the company, which office he was holding at the time of his death.

Since 1905 his official headquarters have been Fitchburg, Mass., from which point he has travelled extensively looking after the larger interests of the company in various sections of the country. He purchased the land and had charge of the construction of the Canadian factory at Montreal, and during the greater part of the last year has been located at Lockport, N.Y., supervising the construction of the large steel mills which the company was building at that place.

He was a man of sterling worth of the old New England type, a descendant of a family established in Massachusetts for many generations, strong for the right, abhorring evil, loving quiet and shunning display. A man of honor, reliable, conservative, a loyal friend, a devoted and generous husband and father, he is deserving of the highest tribute for the life which carried out his high ideals of right-living, and for his quiet strength of character.

He leaves many friends in Fitchburg, the home of his boyhood and early manhood; in Chicago, the scene of his labors from 1880 to 1905; in Pasadena, his latest residence; in Montreal, Canada and Lockport, N.Y., the field of his recent endeavors; and in every branch house of the company, where he was ever a welcome visitor.

An Important Southern Timber Deal

Negotiations which have been pending for several months were completed in New Orleans last week whereby the Desha Lumber Company, of South Bend, Ind., and Arkansas City, Ark., purchased from J. & F. Nalle, Philidelphia, Pa., the Panola Plantation located in East Carroll Parish, La., on the M. H. & L. branch of the St. L. I. M. & S. Ry. The plantation embraces about 2,500 acres of very choice cultivated ground and 4,000 acres of virgin hardwood forest. It is estimated to cut 25,000,000 feet of cypress, oak, ash, cottonwood and gum. The Desha Lumber Company already own 4,000 acres immediately adjoining the new purchase and have a well-equipped logging road in operation, which taps the Iron Mountain at Millikin. At this point a new band mill is now being erected, which will be in operation by November 1st. The Hyde Lumber Company, of South Bend, is the principal stockholder of the Desha Lumber Company and will continue marketing their output as in the past.

At a recent meeting of the hemlock manufacturers of Ontario which was reported in the Canada Lumberman of September 1, a statement was made by the representative of the Nicholson Lumber Company, Burlington, Ont., which was reported in a somewhat misleading manner. As published it appeared that the company was buying from 300,000 to 400,000 feet of hemlock a month and that they often found in buying from different parties $3 or $4 difference in the actual value of lumber which had been bought at the same price. The report should have been that the company is buying from 300,000 to 400,000 feet of lumber per month, and that they often buy pine from one mill which is supposed to be of the same grade as that which they buy from another mill, and that there would often be $3 or $4 per M. difference in the actual value of the lumber.

The McGibbon Lumber Company were also reported to be manufacturing about 75 per cent. of No. 2 stock in hemlock. This should have read "75 per cent. of No. 1."

CAMP DEPARTMENT

Hill Climbing Locomotive

By E. O. Potter*

Being a logger of some years' experience, I can fully appreciate the obstacles and difficulties that man encounters in the logging industry. Some years ago while in the logging and mill business I was confronted with the difficulty of getting logs to the mill. The mill was a good one and was making a good profit on the material cut, but I found that the logging was getting the most of my attention and I was deriving very little profit therefrom. I realized that my logs were getting farther from the mill, and that it would soon be far in excess of what it should be. To overcome this we were obliged to devise some means to put the logs into the pond at a smaller expense. The ground being too steep to operate a standard locomotive or one of the geared type, we were obliged to make some use of a cable. With this idea we proceeded to build a locomotive to operate on the cable. After much experimenting along these lines we built what we later called the Climber locomotive, owing to its abilities. With this locomotive we were able to haul a loaded train up and down steeper grades than any other locomotive of the present type. While it may seem impossible to haul a loaded train on a grade varying from a level track to 25 per cent. grade, it has been accomplished with this locomotive. It must not be inferred that it will not operate on anything but a steep grade as it will work equally well on a level track. It may also be stated that it will start, move or stop a train quicker than heretofore known, owing to the tremendous amount of power, also to the efficient brakes provided.

From the viewpoint of road construction it can readily be seen that the expense attached thereto is more than fifty per cent. less than that of a similar per cent. grade, with the abilities it has it makes it unnecessary to make any long cuts or deep fills, in fact does away with many of the bridges required under ordinary circumstances. This enables us to get a train to a yarder almost regardless of its location and does away with the road engine entirely. The locomotive being propelled by the use of the cable does away with the rotary motion of the driver. This enables us to use a 40-pound rail instead of a heavier one used in carrying any other type of locomotive. Having but its own dead weight to carry with no friction or racing it will require a rail of such size as will carry the dead weight, varying in proportion to the amount of the load hauled and to the weight of the locomotive. Here we discount the ordinary method by about 33 1-3 per cent. on the cost of the railroad material.

In taking up the matter of speed we have to deal with a matter of the most vital importance. The piston travel being governed by the throttle enables us to maintain any speed desired until the maximum piston travel is obtained. To go beyond this we have provided a gear with a ratio of about 6 to 1 or as much more as may be desired. This higher gear necessarily decreases the power, therefore it could be used only on grades that would permit. The speed therefore will be from four to twenty miles per hour.

We have provided a very efficient brake service for the reason that we must allow for the most adverse conditions. The discs on the engine having been enlarged to such a size as will accommodate a brake surface of 864 square inches each. On the main shaft carrying the driven drum we have provided another set of brake drums, each having 1728 square inches brake surface. Each set of brakes being of such size as would be required to brake the cable. Thus we have provided for the alternate use of each, to allow for cooling. Should any or both sets fail to work, become over-heated or for any other reason fail to work we have the reverse motion of the engine to depend upon. Under each set of trucks is placed a track brake, which is so constructed that it will drop at the pleasure of the engineer or automatically should the cable break. These brakes are of such size and dimension that they will bring the entire train to a standstill almost instantly. These being automatic, they are intended to be used only in case of emergency, being very severe on the rails. While we considered this small detail very insignificant at first we now see where it is most valuable. Being an emergency brake only, to be used as a last resort, we deem it advisable to damage a section of track in preference to the whole train.

The cable may vary in size to correspond with the locomotive, grades to be used upon, amount of load to be hauled and the speed to be maintained. In passing over a drum of 54 inches in diameter the cable does at no time come into contact with itself, having its separate grooves to follow all the way over the drums. This does away with all spooling or chafing so common on donkey engines. The cable passing over the drums of large diameter and following its separate grooves has no special functions other than to prolong its lasting qualities.

Immediately above the driven drum is placed a tank provided with the necessary drip cocks to allow any kind of oil to run on the cable which would best protect it from the weather.

Above the cables where they pass from the driven drum to the windlass is placed a steam tightener. This will take up any slack that might occur on the line, insuring us of a uniform tension at all times.

The boiler is of high-pressure Scotch marine type, hung in a cradle, allowing it to adjust itself to a level, owing to its being hung above the center. By providing a universal joint in the steam line we are enabled to draw dry steam on the steepest grades. Under the boiler are placed accommodating oil cushions, allowing the boiler to adjust itself to a level gradually and without any swinging motion. Being permanent and working automatically they will require no attention after filling.

The frame is constructed of the heaviest 14-inch I-beam obtainable and is reassembled, trussed and swaybraced in such a manner as to overcome any racking or vibration, as it is necessary to keep the working bearings in perfect alignment. On the forward end of the frame may be placed a loading drum if required. While this is not an essential feature, it would be very convenient in smaller camps.

Sky Line Logging System

By C. E. McFarlane*

The most of you have read the address of Mr. F. E. Newby, of Hood River, Oregon, delivered at the last session of the Pacific Logging Congress, where he explains the use of the Sky Line system, as used by him as a roader, the logs having been brought to a certain point, from where they were taken by the Sky Line down a very steep hill to his pond, which might give you the impression that this system was only good as a roader.

Now, as a matter of fact, this system was first used as a yarding system, on the Kalama river by McFarlane Bros., yarding logs off a very steep hill and putting them in the river. The hill being about 600 feet high and the Sky Line 1,500 feet long.

An ordinary donkey was used, fitted up with extra brakes, but it was found that, to get the best results, a special donkey was needed. One that would be quicker, stronger where strength was needed, arranged for changing lines quickly and with extra drums to meet the different conditions. A four-drum donkey engine, with 11 x 13-inch cylinders, has been designed to fill these requirements.

The "Sky Line Logging System" is an overhead cable system for handling logs through the air, in which the main or sky line, upon which the carriage travels, is raised and lowered in its operation. The engine used is a four-drum special donkey engine, which in order to secure the best operating results, should be located at the foot of the slope being logged, though not absolutely necessary.

One end of the main or sky line is made fast to a tree, at the top of the slope, about 80 feet above the ground, called the tail tree. The line then leads through a block on a tree or mast at the foot of the hill, to the main drum of the engine. This is a powerful pulling drum, equipped with especially powerful brakes. Upon the main cable travels a suitable carriage, which is drawn up by a trip line, which passes through a block on the tail tree and is led back down to the trip drum of the engine. This drum is also equipped with powerful brakes, in order to control the load in its descent and is driven at high speed to insure a quick return of the carriage.

A line from the third drum of the engine, which is also a high-speed drum, may be attached to the front of the carriage and used to pull it in, if conditions are such that it will not run of its own accord. On extra heavy grades, where there is a great strain on the haul back line, a line may be used from this drum to pull the carriage and sky line down and sideways to the log or logs to be picked up.

The fourth drum is a small drum to carry the straw line, which is used in changing settings.

In operation, the trip line hauls the carriage along the main cable and by means of lead blocks and by slacking off the main line, the carriage is pulled down and over to the log or logs which are to be picked up. The choker is fastened to a hook on the carriage (a self-releasing hook can be used when desired), the main line is then drawn taut, which raises the load free from the ground and permits the carriage to coast with its load, the control being affected by the brake on the trip drum. If, however, it is found at any time that the brake is not controlling the load, by releasing the brake on the main drum the sky line may be slackened sufficiently to check the run of the load, by allowing the load to drag.

---

*Address delivered before the recent Logging Congress at Vancouver, B.C,

*Address delivered before the recent Logging Congress at Vancouver, B.C,

If, on the other hand, the load does not coast freely, it may be assisted by the in-haul line on the third drum.

At the foot of the slope the load is released by the self-releasing hook on the carriage, either directly in the pond, on the landing or upon the cars. However, I think it best, when loading on cars, to use a separate loading engine.

When used for yarding, a strip 300 feet wide, 150 feet on each side of the main line, may be logged at each setting and while the crew are yarding from one setting, the riggers are putting the guy lines and the stub line on the next tree and have put out the straw line, all ready to make a quick shift, so that not much time is lost in changing lines, generally about thirty minutes.

When used for roading, which might be the case if it is desired to remove the logs from an otherwise inaccessible plateau, a railroad, ordinary donkey engines or other means may be used to bring the logs to the tail tree, from where they are then lowered down the descent in a similar manner to the method used in yarding.

The size of the lines used in operating this system varies, according to conditions. In the ordinary operation 1¼ to 1¾-inch main line and ¾-inch haul back are used.

When the sky line is 1½-inch or less, it will usually lead direct to the main drum of the engine. If the length of span requires 1¾-inch or larger sky line, it will be necessary to use a single block on the end of the line, thus doubling the pull of the engine on this line.

There are conditions when the sky line is of great benefit on level ground, for instance, like a proposition I looked over recently, where the company were logging with a railroad on nearly level ground. The timber was small and very thick and they wanted to take out whole trees, so that they could buck them to the desired length at the mill, but could not do it with the ordinary ground method on account of the stumps being so thick.

In that case, the sky line will lift up one end of the tree and the haul-in line will pull it onto the landing from where it will be picked up and placed on the cars by a special derrick, the boom of which is fastened to the head tree mast.

With this system, steep sidehill ground can be logged as cheaply as level ground can be logged with the ordinary donkeys.

In conclusion I will say that there are a great many different conditions in the logging business and that each problem will have to be worked out by itself, but in a great many instances this system will greatly reduce the cost of logging.

THE WOODWORKER

Reducing Costs of Handling in Machine Shops

The first step towards economy in wood-working machine shops, as elsewhere, undoubtedly lies in securing a good practical man as manager or foreman, says a writer in Timber. Such men as a rule have more experience of men, machines, timber and systems than the owners themselves. Not because they have more intelligence, but rather I should say they have had more opportunities of observing and studying the mechanical as well as the commercial side of the business.

There are plenty such men about, who could make a paying proposition of almost any business connected with the timber trade, were they not so severely handicapped by having poor help—scrap machines—and tied down by too much red tape in the office. Good men are always worthy of their hire, more especially machine men, for not only is it the man's wages that have to be thought of; there is the power, the timber, and the firm's reputation always at stake. Get good men, and make it worth their while to stay. Same thing with machines; they should be the best that can be procured for the work you require them to do—not necessarily intricate and expensive. Oh, yes; I know very well that a good machine man may do good work on an old, worn-out machine, (many are doing this daily), but that same man could do much more work and better work on an up-to-date machine in much less time. Some owners may keep their mills for their employees to display their mechanical skill and ingenuity, others say they run their works on a commercial basis, yet they have a heap of worthless junk or scrap iron in place of machinery. No doubt the foremen has pointed the necessity of installing better machinery, which would do the work cheaper and better; but his employers will not be advised by their foreman, who they have placed there to look after their interests, with orders perhaps to cut down expenses wherever possible. It may be the want of money at times, but more often it is the lack of experience or shrewdness that keeps owners from replacing old machines by modern money-makers. Many an underpowered factory of to-day could have ample power were they to instal new machines where necessary. It is very true the foreman can greatly help any firm to lose its capital or to increase it. The former he can do unaided; the latter must have the co-operation of the owner to a large extent. Of course, there are hundreds of ways to economize, but without good machines they avail but little. What is the use of having several large machines of the best make, fitted with good knives, etc., if you have not a good grinding machine to keep them in first-class order? You are simply restricting their output and losing many pounds by trying to save a few dollars. Same thing can be said of saws and belts, etc., etc. The practical experience of the foreman must be worthy of consideration if he is a good man, and alive to the interests of his firm; if not, he must be a nuisance, and should be replaced at once by someone who does know his work, and in whom you can have confidence. You must have a first-class man in charge of every department, and he must have the confidence of his employers, also those who have to work under him. He should have a certain amount of latitude, and not have his hands tied too tightly. Of course, there are black sheep in every fold, but when any firm gets a good man, he should not suffer for the misdeeds of his predecessors. Brains, intelligence, ingenuity, and mechanical genius are all valuable assets, and should be paid their full market value, and encouraged by confidence.

Vertical and Horizontal Band Mills

Many engineers and experts declare that the band mill is the machine of the future, and the advocates of the vertical principle are not less ardent in their praise of the prevailing type in their own country than the promoters and inventors of the European horizontal band mill. However, that this is a correct forecast of what may yet exist in the order of sawing machinery is, in the writer's opinion, questionable, for in many respects the log vertical frame for labor-saving and accurate work surpasses the band saw. Probably the greatest disadvantage of the band mill is the many operations required for the complete sawing of a log—at all events, when such is cut into boards. Each board entails the return of the carriage, besides the adjustment of the machine to suit the thicknesses of the material being cut. Of course, by the modern devices embodied in the latest designs of the band mill the backward motion of carriage and the fixing of the saw and carriage in correct position can be effected with remarkable speed. Yet in the case of the reciprocating vertical log frame these operations are not necessary, which conditions impel me to say that the latter machine excels the band mill in no small measure for certain kinds of work.

But notwithstanding these remarks the band mill merits the attention of mill owners, and it must be acknowledged the superior machine for some classes of work compared with any other in the trade.

So far as I am aware there are three distinct types of this machine in use, namely, the vertical, the horizontal which performs its work by the upper portion of the saw blade, and the horizontal that saws the timber by the lower part of the travelling web. The makers on the Continent of Europe may be guilty at times of a little exaggeration when describing the producing capacity of their machines, but they cannot overtake or equal our American friends in the way of eulogy.

Not long ago an article was written by an American writer (perhaps the maker) asserting that a certain vertical band mill in use there produced the marvellous amount of 50,000 to 60,000 superficial feet per day. The writer, so far as I can recollect, was discreet enough not to state the length of this day. In this part of the world a day is computed at 9 or 10 hours, but perhaps our friend took advantage of the entire 24 hours, and proclaimed the continuous output of this period as one day's work. Unless such an alternative was resorted to, I for one would be inclined to question this enormous output for a single machine.

Let this be as it may, we must admit that America has achieved wonderful success in the development of woodworking machinery, as well as in other departments of the mechanical world. I am always reluctant to criticise or belittle any particular machine or to accord praise to one at perhaps the expense of another, yet in the interests of truth, and to save grave disappointment, it is at times expedient to describe the actual quality and capacity of machines so far as it is in one's province and power to do so.

The vertical (American) band saw may be as rapid a producer as any other, and well adapted for the conversion of timber, particularly in American forests or cities, but for labor-saving, safety and smooth cutting the horiznotal type can prove itself to be the best machine. With the vertical the wheels and saw are permanently fixed, and the required thicknesses of planks or boards being run is obtained by the adjustment of the travelling carriage. Considerable trouble is sometimes occasioned when dealing with round timber by the fall of the first slab or board. Unless the sawn piece is held in uniform position with the log from which it is severed it falls down at the one end and will break away at the other ere the saw is completely through.

The horizontal is immune from this disadvantage. The position of log and saw positively prevents such results occurring. That the horizontal can be adjusted to suit the sizes of board to be sawn more quickly than the vertical the writer is not prepared to say, but on the latter machine this operation cannot be performed so conveniently by the sawyer in charge, one or two assistants being required. With the horizontal all adjustments and feeds are under the direct control of the sawyer, for with and by the levers at his hand every necessary movement of the saw, carriage and feed is secured. So when these two machines are compared from a mechanical and practical point of view one is impelled to admit that several superior features are embodied in the horizontal band mill.—A. M., in The Timber Trades Journal.

A Plea for Good Veneered Panels

I cannot refrain from drawing your attention to a practice which I believe is responsible to a greater extent than anything else for defective panels. That is the practice of rushing them through the factory. In most veneer mills great care is taken to see that all centers, faces and backs—the various piles of the panels—are thoroughly dry. Expensive machinery is installed to accomplish this, and no pains are spared to extract every particle of moisture before the stock is taken to the gluing department. In this condition the glue is applied. The larger part of the glue solution is water. The various parts of piles of the panels being so absolutely dry and in the best possible condition to absorb moisture, all this water is taken into the wood. While the panel is in the press or the retainer, there is no way for this water to evaporate. When the glue is set, the panels are removed from the retainers, but are put up in solid piles, with no chance whatever for the moisture to escape. They may stand here for several days, and are then taken to the trimmer. They are removed from the pile, trimmed and immediately re-piled. Then they go to the shipping room, and are put into crates without separating any more than is necessary in handling. All of this time, you will note, there has been little, if any, time when the panels have been separated so there could be any chance for the moisture, which has been absorbed with the glue, to escape. I cannot overcome the conviction that panels should be "stuck up" and allowed to dry for some time after gluing, or stuck up in a low-temperature redrying kiln. I fully realize that this would require more factory room, also small additional expense, but I am also as firmly convinced that it would be fully justified, and more than offset by the quality of panels that would be turned out."—E. K. Pritchett.

Fixed Knives in Four Side Planing and Moulding Machines

Modern improvements have largely contributed to materially change the construction and the efficiency of the four-cutter, as conventionally understood, so much so that the acceptation of the term four-cutter is no longer tenable, and has in numerous instances given way to the more explicit term—Four-side Planing and Moulding Machine, which is unquestionably more definite and correct.

The number of revolving cutter-heads, top, bottom and side, may of course be increased from the original four to any convenient extent, with or without advantages, more perhaps to be determined by the nature of the work and the class of timber to be operated upon.

The point, however, which would appear to call for consideration is the introduction of the fixed knives and their value.

It were, perhaps, no transgression to say that theoretically the fixed knife is right, but in the abstract it would seem that in certain circumstances the advantages can be outweighed by an opposing element, or perhaps more correctly speaking, the lack of it, viz.: speed.

In revolving and fixed cutter planing and moulding machines we are accustomed to consider feed rates of speed of from 20 to, say, 80 feet per minute as the limit.

When, however, we come to a fixed knife machine only, the feed speed is somewhere about 750 to 1,000 feet a minute—rather a wide difference, and which tends to imply that if one is correct the other is incorrect.

Admittedly, we cannot expect to attain this high rate of feed speed with revolving cutters, whilst with the slower feed—20 to 60 or 80 feet per minute—it is extremely doubtful whether the fixed knives perform their work adequately.

Again, it will generally be found in the case of flooring and similar machines only, that the best authorities on woodworking machinery generally and planing mill practice in particular, do not advocate—even allow—of a feed speed with revolving and fixed cutters of more than 200 feet per minute, and it seems tolerably certain that with a lower rate of feed fixed knives are no advantage. In these circumstances then, for all planing machines employed for other than the softest woods, the probability is that the use of fixed knives might reasonably be abandoned, and what is requisite in the way of the extra finish after the wood has been passed through the revolving cutters may be more efficiently and economically performed by the scraper or the sander, preferably of the triple-drum pattern.—C. C. W., in Timber.

The Driving Centres of Belts

One of the most fruitful causes of trouble in a saw mill, or, in fact, in any works, arises from running driving belts at improper centres. If they are too short, tight belts become necessary, which means increased slip, increased spring on the shaft, and pressure and wear on the bearings, more rapid deterioration of the belts, increased difficulty of lubrication, as a constant speed cannot be maintained.

On the other hand, very long driving centres are also wrong, as these occasion excessive flapping and sagging of the belt and increased vibration to the machine and its foundations and wear on the bearings. No arbitrary rules, however, as regards driving centres can be laid down, as these must be determined by the power to be conveyed, the nature of the load and the speed of the belt, but short centres and tight belts cannot be too strongly condemned.

A rule sometimes used in ordinary machine driving is to make the driving centres in feet equal to eight times the square root of the width of the driving belt in inches, but for many woodworking machines the writer is of opinion that the centres thus obtained are not sufficiently long for woodworking machinery, and can in many cases be increased with advantage at least 20 per cent.

In arranging a drive it is very bad policy to unduly stint the width of the driving belt or the diameter of the pulleys transmitting the power, as a drive may be correct in centres, and yet fail from these causes, the driving belt slipping through insufficient area of contact on the pulley faces. The writer has rectified many cases of belts slipping by simply increasing the diameter and width of the driving and driven pulleys, of course preserving the same ratio of sizes.

Wherever possible, the lower side of the belt should be the driving side, as increased contact is then obtained from the "sagging" of the belt when running.

In this connection it should be borne in mind that with leather belting it takes about 46 square inches of belt contact on the driven pulley to transmit 1 h.p., 52 square inches of cotton or woven belting. A general calculation is that the h.p. of a leather belt equals its velocity in feet per minute, multiplied by its width and divided by 1,000.

If too narrow a belt be used to easily transmit the required power, it has to be unduly strained, which has practically the same effect on belts and bearings as running at short centres. A fair working strain for a single leather belt of good quality is about 50 lbs. for every inch of width, and for double belts about 80 lbs. An overstrained belt is sure to slip, and the use of narrow belts is the reverse of economical.

The total value of declared exports to the United States from St. John for the quarter ending June 30 amounted to $645,835, an increase of $226,200 over the same quarter in 1910. A large portion of this advance was in lumber, laths increasing from $95,000 in 1910 to $124,970 in 1911, wood pulp from $72,000 to $85,777, and pulp wood from $14,000 to $37,950.

The Retail Dealer and His Problems

The Secret of Good Collecting—"Eternal Viligance."

Collections

Collections that collect are the principal source of the success of any retail lumber business which does well. There are collections and collections, but the collections which spell profits are those which bring in the cash and keep the bad and doubtful list of customers at a minimum. Collections which are collections in name only are an added source of expense to a company. In the collection department, therefore, more than in any other, it is essential that money spent should bring results. The best way to find out what other firms are doing in the way of perfecting their collection systems, is to read the trade papers and the second best way is to write a description of your own system for such a journal as the Canada Lumberman, and possibly your fellow retailers, after reading it, will give you the benefit of their own ideas. The columns of the Canada Lumberman are open at all times to its readers for the discussion of their trade problems, and we hope that this question of collections, as well as a host of others, will receive continual attention from our readers from time to time. Send in your own ideas upon these subjects, and let us pass them along.

Collection That Collects

By One Who Has Tried.

"Eternal vigilence is the price" of good collecting. This sentence suggests the main plank and if this is supplemented by polite but progressive persistence, a good platform is obtained.

The precedure is simple and will be best illustrated by beginning at the beginning; that is, with the delivery tickets. These are the usual triplicate form of yard invoice made out by the shipper and each one represents a load or parcel of lumber, lath, shingles, doors, sash or other material sold by a sash and door factory and retail lumber yard. A rapid survey of these tickets is made, preferably as soon as possible after delivery. The regular good pay customers are easily recognized and passed over for the present, but the new names come in for closer attention. A reference will be made to the original order, and the sales clerk, to see what is known as to the standing of the purchaser. In this connection the city directory may be consulted or the mercantile directory, but usually with little or no resulting information, as the party wanted is frequently a new-comer and unrecorded in either. Of course, the sales clerks have instructions to be particularly careful as to whom they issue credit, but it is equally manifest that to increase sales, chances will be taken, particularly with small purchases.

Your action with regard to new customers who may perhaps prove valuable additions to your clientile, must necessarily be canny. Accordingly if the new purchaser is merely unknown to you, you do nothing but send an invoice for the goods and place the name on your prompt collection list. If a remittance does not soon follow you will require to send the collector or take such other action as seems necessary. Promptness and business-like precision at the commencement prevents the barnacles accumulating. Many would-be dead-beats or long period creditors are frightened into prompt pay when they see you are not to be trifled with, or imposed upon.

As a general thing, the sooner invoices are mailed the sooner remittances follow. Invoices should certainly all be sent out at least twice a month, even to the regular builders and contractors, as the modern contractor usually wants to know promptly what he is to pay for, and it gives him a chance to have errors adjusted. The manufacturers as a class demand invoices with the goods or a day or two after delivery. This is the most satisfactory way from both sides, and we never fail to supply the invoices as required. Similarly the statements should be sent out as soon as possible after the first of the month. A complete list of all open accounts is placed before the credit man as soon as the statements are issued. This is divided into two sections, one, of the accounts under one month old, and the second, of older accounts. The statements are all carefully gone over and the accounts one month old or less which are subject to two per cent. cash discount in thirty days and nominally due on the 15th are so marked with a rubber stamp. We believe in the philosophy of accounts which says that the attitude of the customer towards paying depends largely upon the attitude of the seller towards collecting. If the latter is free and easy in collection the purchaser will be dilatory in settling, and if the seller expects and demands prompt payment the purchaser will be correspondingly diligent in making remittance. It is much a matter of habit.

The modern department store does not suffer in trade because it asks for cash with the goods. It is simply understood that no ledger accounts with customers are carried and everyone, including the most inveterate charge customer, bows to the rule of no credit, and find the money. Train your customer to discount his bills. It pays to emphasize the discount. Many customers will be found to respond to the direction on the stamp and the money will flow in around the middle of the month. The sensible man wants the discount, and is quite ready to comply with the rule. Following up on this line about the 20th we go over the list of one month accounts and get out statements of those not yet settled, and with a brief foot-note draw attention to the fact that remittance should be made promptly to save the discount, and even draw attenion to the actual amount that will be saved. This method brings many more settlements and we frequently get out a further lot of similar statements near the end of the month as "a last chance" to secure the discount. Obviously from what has been said about the philosophy of accounts it does not do to be too lenient in allowing discount, as, if the customer once finds out that he can put off payment till long beyond the thirty days, and still obtain the two per cent. discount, the chances are against his making payment in the future. If he discovers by experiment that by running over his thirty days he loses his discount, the probability is that another month he will settle on time.

Another stamp we find effective when judiciously used, bears the words, "Evidently this account has been overlooked. May we ask you to kindly favor us by payment of same?" But what succeeds with one is useless with others, and a variety of methods adapted to particular cases must be studied out and used to insure success. It is hard to lay down cast iron rules for collections. On the one hand you desire the trade to increase with an ever widening circle of satisfied customers and on the other you must have the customer's money, to carry on and extend your business to meet his needs. Very often these two ends, big sales and prompt collections, clash, and it requires considerable tact to accomplish both at the same time. The efficient collector does not always obtain credit for his diligence and faithfulness in getting in the money without friction. It is not always as easy as it looks. Any business that runs along year after year with a small percentage of loss, spells a good collecting system efficiently carried out, and it is a question if it is not as difficult to attain this end as it is to increase the sales. Many a sale is made that would be a loss had the collector been asleep at his post. The collector gets to know the "bad and doubtful" list, and if any of this class are booked he has many an anxious moment until the cash is cafely banked. Sometimes it means hard pressure—a lien, action, a garnishee or simply a persistent dunning, all of which requires boundless energy on the part of the collection staff.

This matter of persistence, needless to say, is of vital importance. The collector, who should be gentlemanly in address, and yet possessed of enough dignity to command respect, should always endeavor to bring the debtor to make a definite promise to pay at a certain time, and if an appointment to call again at a certain time is made, the collector should never fail to call at that precise time and place. This shows that he expects the debtor to keep his promise. It puts a man on his honor, and even if there is but a spark left it is well to appeal to it. Most men like to be well thought of, and a man has to become brazen indeed when he is ready to laugh at his broken promises. Steady persistence will wear down the toughest debtors. Again and again we have seen the most hopeless accounts collected in this way.

Many accounts can be collected by correspondence, including local ones. The letters should be as frequent as required and should be graduated in force so as to bring an accumulating pressure to bear on the recalcitrant debtor until he feels that he must do as expected. It is not usually a good plan to threaten suit, at least not at first; as threats, to be effective, must be followed up, and suit should invariably be a last resort. Reserve your ammunition until you get to close quarters. But you must be prepared to go as far as suit to bring some to time, but one should choose the psychological moment for this, as the story books say.

This matter of correspondence is big enough for an article itself, enough has been said to show the main principles of a system of collection that collects.

Know Your Man and Keep After Him

W. N. Acton, Almonte, Ont., is one of those fortunate ones who do not carry on a general credit business. He has succeeded in a large measure in educating most of his desirable customers to the excellent habit of paying cash for their lumber. In a brief letter to the Canada Lumberman and Woodworker he makes the following suggestive remarks:—

"King Dodds' Horse Book said, 'when you have a blemished horse, part with it.' This is like shifting the burden from one shoulder to the other. Small manufacturers and portable sawmills and others of the same class, selling direct to the builders are one of the problems here. Limited credits are given with consequent losses. The courts are not in all cases a satisfactory protection. The collecting agencies have not yet been resorted to.

"The late James MacLaren, president of the Bank of Ottawa, with whom I learned the lumber business, had a good plan. It was to keep after the delinquent customer, and above all to know your man and his affairs. My endeavor is to follow this plan strictly."

Specify Definite Date of Shipment

"We have found it advisable to have specified invariably in all credit transactions with our customers a definite date of payment, interest being charged on all credits over two months." This is the key-note of a letter to the Canada Lumberman, from a well-known Ontario retail firm. "We have our collector notify all such customers," they say, "a few days in advance of the due date, calling personally on those within reach. In the case of those unable to meet their indebtedness we authorize our collector to ask for a note covering the amount, the note to be endorsed in cases where the credit involves any risk.

"We have found that the naming of a definite date of payment, alone brings a more ready response on the part of the customer, while his knowing the fact that it is our practice to be punctual in giving indication of the maturing of all accounts causes no offence to be taken."

There is little question that this practice is one of the most reasonable and business-like methods of collecting accounts. It is the practice adopted, in a more elaborate form, by all insurance companies. A man whose premium is coming due in a few days can always depend upon it that a notice of the fact will be sent to him by the company. It should be the endeavor of all retail lumber dealers to approximate their system of notifying their creditors of the date of a bill, as closely as possible to the system in force among insurance companies. And it should be the constant effort to make the creditor feel that it is as much to his interest to secure the discount reward of prompt payment as it is to make sure that his insurance is kept in force.

On Credits

A good many lumber salesmen are careless in selling to people who have second and third credit ratings. Bankruptcy is a disease that has three distinct stages.

First: Getting slow in pay.
Second: Renewing notes.
Third: Being placed in the hands of a trustee.

It is a fair statement that ninety per cent. of such people have signs out long before they are broke. Losses on lumber sales, if care is exercised, should be but a very small percentage. A policy pursued by some wise men in the lumber trade is to get on their sales ledger seventy-five to one-hundred customers who are high-class as to credit, prompt as to pay, fair as to inspection; who have a liberal purchasing power; and then spend their energies serving them the way they should be served. This class of lumbermen contend that it is not policy to be everlastingly chasing over the country for remote single car orders, and in following the path that is beaten good and hard by the average lumber salesman. If you are never caught in the wrong kind of a customer's office, you will never sell him. Let the chaps with big capital and a poor sales force handle the poor credit risk customers, and don't overlook the fact that the right kind of terms are prompt settlement on arival of each car by note or cash.

If you have a line of customers whom you can get to live up to these terms, you can handle twenty-five per cent. more business without increasing your capital.—Hardwood Record.

Pile Lumber Face Down

Deterioration in the grade of lumber from whatever cause produces a loss, says the Lumber Trade Journal of New Orleans. Some lumber is graded from both faces, while other lumber is graded from the best face alone. Many mill men have discovered when shipping lumber, that the quality of the piles according to the inventory does not exist on account of damage arising, while the lumber has been in pile. Some damage is the result of no attention to the location of cross-bearing strips, making warped and stained lumber, which does not occur when the strips are placed in a straight line one above the other.

Piling lumber with the face down has several advantages. One of them is that the face is always bright, and never checked, even though the back may be checked. A bright face means salable lumber at the grade from which it comes from the saw.

There is also a saving of expense by this method for the inspector is obliged to turn every board in order to see the face and dimensions, and it is unnecessary to turn it back. Where no attention is paid to the face in piling, many boards are found face up that are badly checked and have to be thrown out,, and where the board is turned by the inspector, someone has to follow him and turn it again. This costs money, which can be saved by proper care in piling, and will help out on the profits.

Handling Lumber a Quantity Business

The lumber business is one of dealing in large quantities, especially in the wholesale branch of it. It is thought of as cargoes, blocks of stock, and nothing less than a carload. To the retailer, the unit of largeness is expressed in several carloads, or a carload, for a bill that will require either of these—coming down to the smaller units of the wagon load and the "jag," which may amount to from $50 down to $4 or $5, as the case may be. As we think, so we are. If we think in dollars our natural tendency is to spend in dollar quantities. Our business being large we think of it in a larger way than the man who keeps a little notion store thinks of his, and we unconsciously get into the habit of running our business on these lines of thinking. The average retailer, hasn't much use, as the saying is, for the class of customers who furnish the little driblets of trade, even though he knows it is the most profitable to him. He would much rather sell a bill in an hour's time that won't yield him $10 profit than to sell driblets all day and make the same money. In this I am speaking more of the old timers than of the younger men, for the latter are beginning to adjust themselves to the changing conditions of the formerly. The old habit of looking at things in a large way is changing to the focussing of our vision on those which once were to the lumberman as "unconsidered trifles," and too small for his notice.

The nature and character of the stock and of the retail business is such that it can hardly be otherwise than that a percentage of the stock will become damaged by too much exposure to the elements of the weather, or not having enough air. Hardly a car is unloaded but what some is broken before it is put into the pile, and then in the loading and delivery again, there is some more of it damaged or broken. During periods of dull trade the tops of the piles become almost unselectable in the regular way. Timbers and long joists and scantling that are of slow sale get "doty," warped and twisted, and are usually laid aside and refused by the more careful buyer who won't have anything but what his bill calls for. Material is returned from jobs where changes have been made, or where too much was figured in the bill for them, and considerable of this is almost sure to be more or less damaged and not as saleable as it was when it first went out of the yard. Bunches of shingles and lath will get broken in the handling, and unless taken care of at once, will either be blown about with the wind or will leave the yard with the small boy where the yard is unfenced. Kindling is scarce with most people in the winter, and those who live near a lumber yard don't think it any particular harm to go through and pick up a few pieces of short stuff that are laying around and don't seem to be any account to the lumberman or he would pick them up himself and take care of them. A 2 x 4 16 feet laying in the pile is worth from 25 to 30 cents when broken in two, and one piece laying here, and another around somewhere else is wholly lost unless they are picked up and sold for something, or used in repairs about the yard buildings. Four and six strips of the common grades are more likely to break than scantling. Some are used in piling the stock, but unless they are taken care of when not so in use they will become lost to the yard and no one knows where they are. It is the same with lath that is used for this purpose. In the taking of stuff from the pile they will, of course, fall down in front, back, and at the sides of the pile, and there they will lie until gathered up by some one. They are sure to be used by someone for something or other that they are useful for. Now every whole lath is worth at least half a cent. If a dealer sees a penny lying in the alley he is going to pick it up, no matter how busy he may be at the time, but will he stoop and pick up a couple of broken laths and take care of them as in the case of the penny? Hardly ever, you will say, and yet his instinct of saving the pennies acts inconsistently in this case. It is the same with every piece of lumber that is lying around loose in the yard. Whether it is worth a penny, a nickel, dime or a quarter, it has cost the dealer that much in money, and if he don't save these

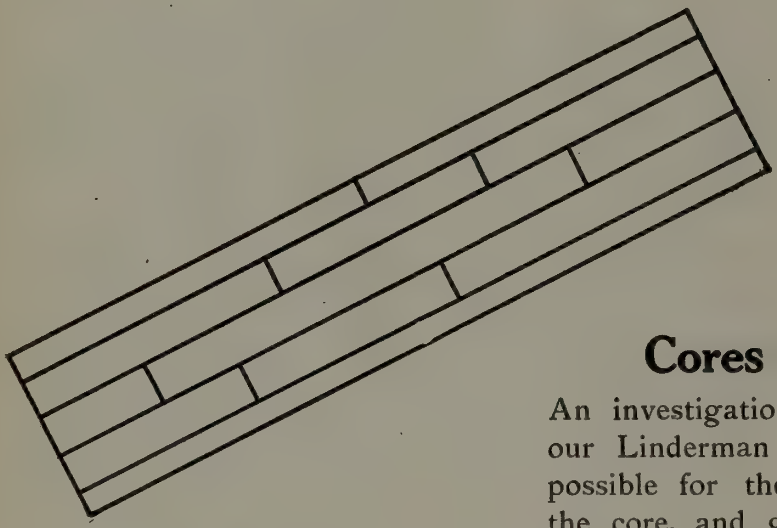
Box Shooks

One of the most difficult propositions is the profitable working up of mill culls. One of our Linderman four foot machines is now running 22 hours a day on Mill Culls, from two to four feet long by three to four inches wide. The average daily output for the 22 hours is 20,000 board feet, the total daily wage for the two shifts of three men each is $9.50, making the cost less than 48c. per thousand, and the product is accepted as one piece stock. Consider the saving over the previous year when one piece stock was furnished.



Cores for Veneered Work

An investigation of how cores are put together on our Linderman Dovetailer, will show you how it is possible for the entire work of putting together the core, and glueing it to be done for less than the glue alone costs in the old method. This is effectively demonstrated by the fact that in one plant there are seventeen Linderman Dovetailers doing core work. In another there are eight machines, and in over fifty other plants there are one or more. A Linderman Dovetailer is absolutely essential to any progressive manufacturer of Veneered Doors, Pianos, Furniture, or Cars, as the saving is enormous.

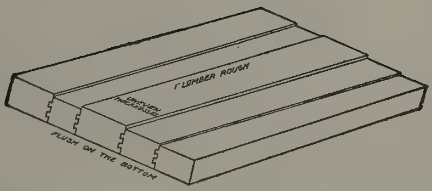
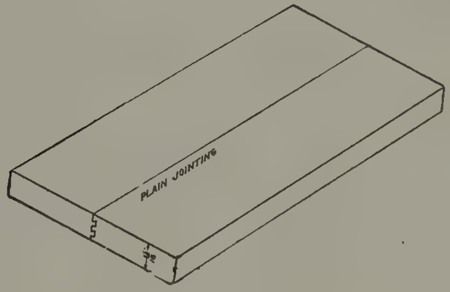
Lumber Manufacturers

One of the most discouraging propositions to face is the disposing of narrow width, short length, lumber, so as to break even. In over a dozen Mills two or more of our Linderman Machines are converting these narrow widths into wide stock at a cost averaging 75c. per thousand feet. Some of these Mills use up this joined lumber in their own product, but there are several who sell it to other manufacturers. One concern, before the first machine was installed, sold their entire output for eighteen months at three to sixteen dollars more per thousand than they formerly obtained for their narrow widths.



Agricultural and Wagon Work

The cost of wide dimension stock is growing more serious each year. On our Linderman Machine we can make from narrow miscellaneous widths, stock of any width, and of any length up to 18 ft. at a cost of approximately 50c. to $1.00 per thousand; consider the fact that a bottom or side built up of 3", 4", or 6" strips will retain its shape better, and is not so liable to split as one piece stock.



Furniture, Casket and Cabinet Work

Cabinet Jointing must be accurate. For this reason many manufacturers think the sometime excessive jointing cost is unavoidable. Many do not even know what it does cost. This unknown excessive cost can be found by examining the edging waste at the rip saw, the cut taken to make the joint, the glue gathered on the top and bottom of the joint, the time lost in handling the stock, the wages and cost of operating your glue joint department, and in addition, the inability to work up a large per cent. of your kindling wood into a marketable product.

The Linderman Dovetail Glue Jointer overcomes all this—to cover it broadly—for one-fifth of your present cost it will do the same work, and in addition give you a better and stronger joint.

little dribs he is out of pocket the amount, whatever it may be, large or small. We all are aware of the fact that it is unavoidable to prevent more or less of a loss in such a business as that of handling lumber, but it can be made less than it is through the dealer's careful watching, and preventing as much as possible the causes of it.

Most Essential Thing the Drilling of Employes

One of the first and most essential things in doing this is to drill it into his employes that he requires of them, first, that they should exercise care in the handling of the stock; secondly, that when a piece of any size is broken off, it should be taken and laid aside somewhere out of the way, and, furthermore, under this head that the entire yard should be gone over at the close of every day, if possible, and all loose pieces picked up. Where business prevents, this going over should be done at least once a week. In doing this frequently it will become in the nature of a habit, and then again, it will require but a few minutes of time. Every Saturday the yard should be thus cleaned up whenever it is possible. I know there are times when the trade continues far into the evening, and in the short days the darkness comes before the day's business is done; but if the employes get the habit of keeping things in shape and cleaned up as they go along through the day, there is not much of this to do when the night falls. The thing to do is to train them to look out for the odds and ends and to take care of them.

What is to be done with these scraps, broken pieces, and twisted lengths of dimension and other culls? A boxed enclosure should be made for the scraps that are good for nothing but kindling wood. Every piece of scantling and joist that is not less than three feet long is saleable, and so is a piece of board that length, also. But they must look as though they were for sale. If the end is ragged, just as it was broken off, it will look as though it was waste stuff and good for nothing but to brake up for kindling. This ragged end should be sawed off, and the length marked on it whatever it is, and the price of it as well. In an unused corner of the shed some sort of a rack can be made to put them in. The warped pieces of joists and scantling may be cut up with but very little waste, and the part that can't be sold put into the kindling box. Short pieces of inch lumber may be cut into the proper lengths for bridging joists in a floor, and in these days of high wages for carpenters these can be sold and bring at least the cost of the material. All this sort of work in preparing these scraps and shorts for sale can be done by the employes on rainy or cold days when there is nothing much else to do, and their wages are going on just the same. There is always something that can be found to do in a lumber yard, and time is always well employed when it is used for picking up the loose ends of the business. In many cases it may be the most profitable for the time being.

The Chance to Work Off the "Any Old Things"

In every town, whether large or small, there is always a number of people who want to do their own repairs. There may be something to do about the place that is too trifling to hire a carpenter for, and which, with a hatchet, a saw and a few nails they can do themselves. They will go to the lumber yard and want a few pieces only of different stuff, generally of common boards and scantling. Oftentimes they say, "Any old thing will do, just so it don't cost too much." This is the chance for the dealer to lead the party to his assortment of "Any old things" that he has cut up for just this class of customers, and they being so much cheaper than what he would have to buy in the long and regular lengths, he is more than apt to buy them. He may be able to select the very lengths he needs, and thus save him from the working of a dull saw in cutting them. If those scraps and shorts are gathered up at once without lying around and becoming dirty and weather beaten, it will make them both look better and more saleable and worth something. Aside from all this question of saving, the keeping of them picked up and having the yard look clean and tidy is alone worth all the extra attention and work in doing it. One does not realize the difference in appearance of a yard so managed and one that is allowed to accumulate rubbish and has only a cleaning up once in a great while. As a general rule, the dealer who is habitually slovenly in his yard is slovenly in his office, and in his methods of doing business generally. There are always loose ends around him which are pretty sure to get lost in time and thereby constitute a loss to him.

There are those, too, who are not as careful as they should be about the broken nickel in their every day trade. I mean by this the odd cents in the making change in a purchase. Farmers, especially, are addicted to wanting dealers to "throw off" the odd cents on a small purchase, the odd fractions of a dollar and the odd dollars on estimates of varying sizes in amounts. It is the odd cents, however, in the small daily transactions that count for most during the year's business. If you get the habit of throwing them off, you will have a leak in your profits that the total amount would be sufficient to pay for your postage and stationery bill for the year. A lumberman even cannot afford nowadays to despise the pennies in his business; he needs every penny that is his in the making of change.—The St. Louis Lumberman.

Coal as a Retailer's Side Line

"Coal as a Side Line for Retail Lumbermen," was the subject of a discussion at the recent annual meeting of the Montana Retail Lumbermen's Association. Mr. J. E. Woodard, superintendent of the Roundup Coal Mining Company, delivered an address of much interest upon the subject, as follows:—

Have you noticed that it is the fellow who never threw a baseball who is the most critical rooter in the bleachers? It is the bachelor who tells you how to handle a wife; the old maid always knows the proper food and care for babies, and the seedy citizen who wants to barrow a "five" is always the fellow who wants to give you a stock market tip. It is pretty much the same thing to have a mere coal producer appear before you to discuss the coal business with you and offer a few suggestions on the handling of the coal end of your business.

It has occurred to me that the retail lumbermen, as a whole, are rather indifferent in their attention to the coal end of their business. No two material lines ever dovetailed together so completely as the coal and lumber business. Particularly in this part of the world is this the case. The winter season is too severe for building operations and the lumber business is at a standstill. Why can't the regular force of a lumber yard be profitably employed in the sale of fuel during that article's busiest season? Why can't the teams that many lumber yards own that are eating their heads off in the winter time be usefully employed in delivering coal? Why can't the sheds depleted of lime and cement stocks be used for the storage of coal? Some lumber companies do not go into the coal business at all, and many others, if they do go into it, regard their coal business as a side line of very little importance. Yard managers and general managers of lumber companies get minute information on lumber. They study its grades, qualities, freight rates, etc. They engage, solicit and importune contractors and builders. They watch building records with hawk-like eye for new construction permits; but when it comes to coal they do not display the same activity or energy. They are usually satisfied with a few regular customers, and they claim they have not time to go into coal matters. They say that their yard is not equipped for the storage of coal; that "so-and-so" is regularly engaged in the coal business and seems to get most of the business away from them, particularly steam contracts and carload sales. You ask the manager a reason for this and he really does not know. He has not paid much attention to prices and he does not know just what grade of coal was bought. They seem to fail to give the detailed attention and persistent energy to the coal business that they do to their other lines, and naturally they complain that there is no money in it.

A few years ago this northwestern country experienced a coal shortage and a real serious one at that. This was not due to a lack of coal mines, but primarily to the congestion of the railroads and the general failure of dealers to provide themselves with storage. The year of the shortage the average number of days that the commercial coal mines of the Northwest worked was less than two hundred. As soon as business conditions mend and the country grows active again, coal shortages are likely to recur unless the dealers of the Northwest arrange to provide themselves with reasonable storage facilities. In the East the retailer of coal puts in most of his stock of hard coal in the spring and the bulk of his domestic soft coal is stored during the summer months. During the summer he receives a concession in price, more carefully prepared coal and immediate deliveries by the railroads. Unless the mines of the East are tied up with prolonged labor difficulties the dealer hardly ever has to turn a customer away for lack of coal on hand. Out here we do not have hard coal, and some of our soft coals deteriorate quickly and can not stand prolonged storage, but we have a good many coals that when properly housed will stand four to eight months' storage without any deterioration. Loss of sales consequent on running out of coal during the winter months fully offsets the interest on the money tied up in a reasonable amount of storage coal. The loss of the sale of a ton of coal never can be made up. The mines can produce just so much coal a day, so it is impossible for them to give immediate attention to the orders of every dealer when all orders come in over the wires together at a time when the thermometer drops to about zero. If the coal dealers of the Northwest would realize that it takes more than an express dray and a wagon scale to conduct successfully the retail coal business the "fly-by-night" dealer would be eliminated; there would be fewer dealers, and the general conditions of retail trade would improve greatly.

I would urge upon the lumber company that enters the retail coal business to build a reasonable amount of substantial storage bins; to fill these bins in the early fall and to keep a supply in them through the winter. I would suggest to the manager that he acquaint himself generally with the coals tributary to his territory; determine the kind or kinds that he can profitably handle; become acquainted with the producers, the size and equipment of the mines, their probable ability to fill orders and the kind and quality of preparation they make.

Though it is hard and expensive to introduce a new article to the public, the coal dealer can influence his customers much more than any other man, for the reason that ninety-nine out of every hundred people know nothing about the coal they are burning and have not studied their own fuel problems. Each of the good coals has its special advantages and frequently a good grade of coal will fail in a place where a poorer coal will succeed, simply because the user has not learned the best way to handle his coal and has not adapted his heating appartus and drafts to the particular size and kind of coal he is using. I would not always advise a lumber yard to go into the coal business where retail coal dealers already strongly occupy the field, but where lumber yards are in the coal business let them work it for all it is worth or let them stay out of it. Properly handled it can make you as much money as any one line you handle. Indifferently conducted it will always be a nuisance and possibly a money loser. The lumber yards that pioneer our new western towns have an excellent opportunity to properly inaugurate the retail coal business and should always be able to hold the bulk of the business if the managers and yardmen will give it a proper allotment of their efforts.

Nobody is so popular during the brief winter months and nobody so unpopular through the long spring and summer months as the salesman for a coal mining company; so I would plead for him and ask that when you "roast him" for delayed shipments and deliveries and poor preparation you bear with the producer a little and consider that he has troublesome business problems to solve just the same as his friend, the lumberman. There is no business whose very life is in such constant jeopardy by reason of accidents or explosions that in one hour will wipe out investments and earnings of years; no business so completely dominated by organized labor with its constantly increasing demands for higher wages and poorer methods of mining in return; no business in which more of its product is wasted in order to fill the orders of its customers; no business so entirely dependent upon railway transportation at a time of the year when the railroads find operations most difficult.

U.S. Lumber Flooding Canadian Markets

Unprecedented Increase in Imports from Across the Border — Average Price Decreased by $3.12 per Thousand During the Same Period

The annual Summary of Commerce and Finance of the United States, recently published, gives a fair idea of the lumber trade of the country and throws light upon the relations of Canada and the United States, so far as the lumber industry is concerned.

With regard to exports from the United States to Canada, under the item "boards, deals, planks, joists and scantling," the quantity increased 217 per cent. in 1911 as compared with 1909, whilst the average value decreased $3.12 per M. feet. In "logs, round timber, firewood and timber hewn and sawed," the value, exported from the United States to Canada in 1911, was 53 per cent. greater than in 1909.

Regarding imports of wood goods by the United States from Canada, "boards, deals, planks and other," increased in 1911 over 1909, by only 18,389,000 ft. B.M., whilst the average value decreased 43 cents per M. feet.

Following are the details:—

Exports of wood goods from United States to Canada—

Boards, deals, planks, joists and scantling— Ft. B.M.	Quantity	Value	Average Value
1909	127,099,000	$3,317,043	$26.09
1910	189,193,000	5,163,477	27.23
1911	403,285,000	9,266,275	22.97
Logs, round timber, firewood and timber hewn and sawed—

1909	328,807,225	3,406,663	1.036c
1910	412,562,936	4,226,530	1.024c
1911	576,978,387	5,352,316	.927c

Total importations of sawed lumber into the United States during the fiscal year 1911 were 871,927,000 feet, against importations of 1,053,661,000 feet for the fiscal year ended June 30, 1910. The bulk of the imports of sawed timber for both years was from Canada. Total importations from other countries in 1911 were 15,351,000 feet; in 1910, 8,509,000 feet.

In the fiscal year ended June 30, 1911, manufacturers of the United States shipped into Canada 403,285,000 feet; in 1910, 189,193,000 feet; in 1909, 127,099,000 feet. The total exports of sawed lumber, exclusive of heavy timbers, were 2,060,965,000 feet for 1911; 1,710,761,000 feet for 1910; 1,379,944,000 feet for 1909. From the foregoing it will be noted that last year Canada took about 20 per cent. of the total exports; in 1910 about 11 per cent.; in 1909 about 9 per cent.

During the fiscal year ended June 30, 1900, the United States imported 678,900 feet of lumber from Canada, of an average value of $10.97 a thousand feet. The following twelve months showed a material decrease in the quantity imported, but an increase of nearly $2 a thousand feet in the price. Both quantity of imports and the average value have increased steadily since 1900, as shown by the records for the last twelve fiscal years, culminating in 1910, when 1,045,107,000 feet was received.

A study of the compilation given will show the trend of this trade:—

	Quantity, Feet	Value	Average Value
1900	678,900,000	$7,452,255	$10.97
1901	490,571,000	6,343,865	12.93
1902	664,751,000	9,222,897	13.87
1903	719,110,000	10,567,837	14.70
1904	586,459,000	8,744,393	14.91
1905	705,591,000	10,729,148	15.21
*1906	942,380,000	15,379,615	16.11
1907	924,863,000	15,867,631	17.15
1908	782,789,000	14,989,179	19.14
1909	838,187,000	15,709,531	18.74
1910	1,045,107,000	19,072,306	18.25
1911	856,567,000	15,689,579	18.32

---

*Eleven months calendar year.

The highest average price, $19.14 a thousand feet, was paid for Canadian lumber in 1908. The new Aldrich-Payne tariff law went into effect August 6, 1909, and the next fiscal year showed a very heavy increase in the importation, and a reduction of 49 cents a thousand in the price. Tariff was reduced 75 cents a thousand feet. The record for the last fiscal year shows a moderate import, with a slight increase in the value. Comparing the values of 1900 and 1911 shows an increase of $7.35 a thousand feet in the average price of imports from British North America, which is the equivalent of 67.2 per cent.

Mr. A. Holt has been appointed to take charge of the woodworking machinery department of the Canadian Fairbanks-Morse Company, of Montreal. He succeeds Mr. Williams, who has secured a position in Pittsburgh.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

Ten cars 2-in. Log Run Maple. State best price for cash. Box 330, Canada Lumberman, Toronto, Ont. 18-23

Wanted

Timber to cut by the thousand with first-class mill. Capacity 25 thousand daily. Box 125 Perth, N.B. 19-19

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Wanted

British Columbia Timberlands. We have bona fide buyers for well located timber. Owners only. Send particulars to
Dominion Lumber & Timber Co., Ltd.,
212 Winch Building,
18-19 Vancouver, B.C.

Hardwood Flooring

In many parts of Europe oak has been used for several hundred years for flooring purposes, and the durability of this wood is shown by the condition of oak floors one or two hundred years old. Recently there was torn down in London a house, the floors of which were in almost perfect condition, although they had been laid three centuries before and had received only an occasional repairing in the interim. While the density of the texture of oak makes it almost indestructible through wear, it is the tannic acid in it which makes it almost immune to-day. No description of the beauty of the grain and figure of the oak is needed, for this is well known to everyone who has ever seen or used it. To-day hardwood flooring is considered a necessity as well as a luxury. It is employed in the small as well as the large houses, and the difference in the grade of the wood is the only marked variation in the class of work. Even a second or third grade floor of oak is cheaper than carpets, when its great durability, cleanliness, and sanitary advantages are considered.

Silk From Wood Pulp

In the manufacture of artificial silk wood pulp from Norway is utilized, being shipped to the U. S. in bales. This pulp is cut into thin sheets, each individual sheet is carefully weighed, and a certain quantity placed in a metal tank for chemical treatment.

The various chemical solutions used are mixed in huge iron tanks from which they are pumped under ground through a series of lead pipes to the departments requiring the various compounds. This pulp, having been macerated and digested is submitted to still further chemical action under certain fixed temperatures which are not allowed to vary even one-half a degree.

When it is ready for final transformation into silk the solution closely resembles molasses in color and consistency. At this stage it is pumped from the tank to the spinning frames. Here specially constructed pumps are attached to each spindle, which carefully measure off the required quantity of the solution.

This is forced through tubes with an outlet containing just as many perforations as there are to be filaments in the thread. Through these it is passed to a tank running the length of the frame and containing a chemical mixture which fixes the solution instantaneously into a thread.

This strand is carried over a wheel down through a tube to a rapidly revolving spindle; the rate of speed is about 5,000 revolutions a minute. From this the strands are afterward unwound on reels into skeins. The air in the shinning room is completely changed every three minutes, being pumped off through hoods placed over each of the spinning frames. This is done to remove any possible fumes and to provide thorough ventilation for the operatives.

One of the interesting features in connection with the entire operation is the fact that the yarn is handled as little as possible. The specially constructed stoves and bleaching arrangements are ideal, and when the skeins are finally carried to the large drying room on the fifth floor one marvels at the change which has so rapidly taken place. From here they are taken to the sorting room, where each individual skein is carefully examined by skilled operators.

Fire-box for Burning Wood Fuel

"A Kangaroo" asks : "How much larger should the fire-box of a steam boiler be for burning waste wood—chiefly hard—instead of coal, and about how much wood would be equal to a ton of average quality coal for steam raising?"

Wood fuel for steam boilers requires, on an average, one-third more grate surface and two-thirds more cubical space in the furnace than is required for coal for an equal generation of steam. The amount of wood required depends somewhat on its nature and the amount of moisture it contains, but, speaking generally, about 2¼ cords of wood should evaporate about the same quantity of water as one ton of good coal.—Timber Trades Journal.

Review of Current Trade Conditions

Ontario

The improvement in trade which has been steadily noticeable during the past month still continues. The demand from retail yards throughout the country is quite good, and the only difficulty is in obtaining delivery. It is almost an impossibility in some sections to get the lumber moving out from manufacturing or wholesale points. This is caused not only by a scarcity of cars, but by the great scarcity of labor. Travellers returning from the country districts report that all over Ontario the demand is good. This applies not only in the West, but also in the extreme East. One traveller reports that he never saw so much stuff going forward as there is to-day. So far as prices are concerned there is little of importance to note. They are well held throughout the list. During the election campaign there was a noticeable falling off in new orders, but an improvement is now expected. The hardwood market is quiet.

Eastern Canada

The lumber trade in Montreal is in a healthy condition, according to the reports of most of the firms. There is a general improvement in the demand and it is expected that the improvement will continue throughout the fall. The lower grades are selling well, especially in pine. Common pine is a strong competitor with spruce. The price of culls is strong. Lath are firm. There is a scarcity of dry spruce flooring. The demand for hardwoods continues strong, especially for birch. Dimension lumber is moving well. The trade with United States markets has also been improving.

The advanced price of shingles at Boston, which went into effect a few weeks ago is still holding, but the demand for extras and clears is not quite so active. Cedar extras are selling at $3.40 to $3.50, and clears at $2.90 to $3.10. There is a good demand for lath, and dealers are looking for higher prices. Present quotations are $4 to $4.10 for 1⅝ inch, and $3.50 for 1½ inch. The general Boston market is not quite so active as it has recently been. The asking prices of spruce lumber have advanced a little, but sales at top prices are scarce. For spruce frames, 9 inch and under, the price asked in many cases is $24, but stocks can be had at $23.50. The New York market has been dull, and several cargos of spruce which would ordinarily have been disposed there, have found their way to Boston. Random is moving only at a moderate rate, and the demand for spruce boards is quiet. Hemlock boards are firm, but not very active. Eastern clipped boards are holding at $19 to $19.50. Hardwoods are in fair demand, but not so active as usual at this time of year. Quartered oak is quiet. Plain oak and maple are in fair demand, at good prices. Eastern spruce at New York is unchanged, and quiet. Hardwoods at New York are only steady, and rather quiet, although there are indications of an improvement in the demand. Plain and quartered oak are in satisfactory demand. The market for hemlock at New York is unchanged.

Western Canada

The lumber trade in the Prairie Provinces and British Columbia is in a very healthy condition at present. Travellers report that building activity is brisk and retail yards are giving good orders in all parts of the country. A well known Ontario lumber wholesaler who recently returned from the west reports business in all lines to be very good. He found a particularly strong demand for hardwood flooring in all the principal cities of Western Canada.

As usual, the competition of United States lumber is making it difficult to secure any reasonably strong prices. In spite of this competition, however, the demand for rough lumber from the prairies shows no signs of decreasing. It is reported that the consumption this year will show an increase of twenty per cent. over 1910. Stocks at manufacturing points are about normal. Those of the coast and mountain mills are estimated at about 150,000,000 and 220,000,000 feet respectively. A shortage of cars is reported by the coast millmen, many of whom are unable to fill their rush orders. This is the annual shortage, resulting from the movement of grain, to the head of the Great Lakes. Mountain millmen report that they are not suffering from any car shortage. It is generally believed that next year's lumber requirements from the prairies will show an increase of seventy-five per cent. as a result of the large influx of settlers.

Great Britain

A tendency toward improvement is reported upon the London market. A heavy autumn import is not expected, as the great increase in freight rates is certain to have a deterrent effect upon demand. Building trade continues inactive, but the packing trade is quite busy. Deliveries at London docks for the week ending September 2 totalled 6,786 loads, as compared with 8,388 loads during the corresponding week of 1910. At Foy, Morgan & Company's recent auction sale, a lot of 3 x 11, 10 to 16 feet dry fourths pine from Montreal sold at £10 15s and £10 10s. A parcel of 3 x 9 thirds, Quebec spruce, 13 feet, brought £9 16s. For 3 x 7 third, Quebec pine, 6 to 16 feet, the price was £11 5s. 3 x 8 brought £10 15s; 3 x 5 brought £10 5s; and 3 x 4 brought £9 15s. A lot of 3 x 11 first Quebec pine, 16 feet, sold at £28 15s., while another lot of the same class brought £29 5s. At Southampton the trade during the past fortnight has been more active than formerly, with a steadier demand for most classes of stock.

The trade at Liverpool is still feeling the effects of the recent labor strike, and much difficulty is still experienced in handling timber goods. Congestion prevails upon the quays and stocks of almost every description are still to be seen there. Stocks on hand, at date of August 31 were slightly above those of last year, but show a decrease as compared with 1909, except in New Brunswick, and Nova Scotia, spruce and pine, the import of which was nearly 2,000 standards greater than in 1910. The consumption showed a decrease of 1,030 standards, leaving a stock of 10,280 standards, which is an increase over the previous year of nearly 3,000 standards. No import of birch logs is recorded. The birch logs which have gone into consumption amount to only 40 loads, which is a decrease of 140, as compared with 1910. The birch plank import is 31 standards greater than last year, and the consumption is 133 standards less, leaving a stock on hand of 461 standards, or 122 standards more than in 1910. Arrivals of Canadian goods have been smaller since the dock strike in Liverpool. The Steamship Companies are asking 5s. to 7s. and 6d. per standard advance upon spring freight rates.

Trade at Manchester continues active, but there also much difficulty is experienced in moving the timber from the docks. The monthly stock sheets show several striking items. Quebec board pine is held at about fifty per cent. less than last year, and the consumption of this timber for the month of August is 26,000 cubic feet more than during the corresponding month of 1910. In birch logs during August, 1911, it reached the startling figure of 15,000 cubic feet. There are, however, still in stock 18,000 cubic feet. The consumption of spruce deals for the month showed very little change, as compared with August, 1910, but the stock is thirty per cent. higher, viz., 4,800 standards more. A good trade in spruce deals, however, is expected between now and Christmas. The consumption of flooring increased about 70 per cent. in August, 1911, as compared with August, 1910, and the stock is nearly 1,000 standards less. Prices all round are firm, with the possible exception of spruce, of which there is a vast quantity upon the quays.

A slight increase in business is noticeable at Glasgow, stocks being on the move fairly well, both from the quays and from stored stocks. It is impossible, however, to say whether the improvement will last. The satisfactory condition of the shipbuilding industry, however, leads to a belief that a good demand will come from this quarter. House building is very quiet. Wagon and carriage builders are fairly active. Box makers and the general joinery trade are quiet. Sales of late have been fairly numerous, including moderate quantities of pitch pine, and Oregon pine, logs and planks, elm, waney pine, birch, spruce deals, pine deals, and sidings, as well as a good variety of American hardwoods. Quebec elm is quite scarce.

United States

A noticeable improvement in business conditions has taken place in some of the more important lumber markets of the United States, during the past fortnight. Reports from different markets indicate a larger demand and an increased movement of lumber during September than during August. It is not possible, however, to assert that the improvement is an indication of the early opening of fall trade. Retail dealers and consumers are still buying only sufficient to meet their daily demands. The general volume of business, however, has increased since the middle of August, and conditions are healthy, particularly because of the conservative manner in which trade is beinb conducted. Collections are generally fairly satisfactrade is being conducted. Collections are generally fairly satisfac- a prosperous trade is certain to result.

Chicago.—Lumber trade conditions in general have improved. Railroad enquiries are more numerous and wholesalers report a good volume of business. It is expected that the furniture manufacturers of Grand Rapids will soon be making heavy purchases of all kinds of hardwoods, as their labor troubles have recently been settled. White pine remains steady with numerous enquiries, but no important increase in trade. Prices are unchanged. Hardwoods are improving in demand, and conditions in general are becoming more satis-

factory. Lower grades are quieter than the higher ones. Plain red oak is in strong demand. The upper grades of white ash are moving satisfactorily. Basswood is slow. Maple, firsts and seconds, is in good demand, but the lower grades are dull. Hemlock stocks are reported to be lighter than usual, and the trade in this class of wood is about steady. There is very little profit, however, to be secured, in the face of southern pine competition. There is a fair demand for sprnuce at steady prices. The railroads are expected soon to be in the market for fir. Yellow pine shows signs of improvement, with prices firmer than usual. The larger markets are holding out for list prices, but consumers seem to expect easier figures than those existing at present. Red cedar shingles have declined in price, being quoted now at $2.98 for clears, and $2.45 for stars. White cedar extras are moving fairly well at $3.10. Lath are improving, and prices are steady. The cooperage market continues unsettled.

Buffalo:—Trade in white pine is somewhat livelier than it was a month ago, but is still below what is expected at this time of year. The demand is fairly good for the higher grades, and stocks are scarce. There is a fair sale for the low grades. Arrivals are plentiful. Spruce is steady. Clear lumber is in good demand, as a substitute for the higher grades of white pine. Canadian spruce is entering the market more freely. Hardwoods are selling fairly well, although in small lots. Plain oak is most in demand. Prices generally are firmer. The demand for hemlock is improving, and higher quotations are expected. There is a good assortment of stocks. Yellow pine is about steady. North Carolina pine is firmer, selling about 50 cents higher than a month ago. Red cedar shingles are dull, and low in price. Stocks are heavy and arrivals are plentiful.

North Tonawanda:—Trade in white pine has improved, and dealers are rather optimistic over the prospects for the fall business. Stocks are plentiful, and prices are expected to advance shortly.

Market Correspondence

The Timber Trade in the United Kingdom

Liverpool, Sept. 16.—At London, business is now proceeding on ordinary lines after the dislocation through the dock and railway strikes. At the public sales, softwood lumber has found ready buyers at recent prices. Canadian wood has met with fair competition, and is evidently still in free and regular use by joiners and cabinet makers. In spruce, 4 x 9 deals and 2½ x 7 have been in good demand and are not in large supply. Pitch pine has been very firm and satisfactory sales of the wood have been effected. Prices are still considered to be too low to be remunerative. Hewn wood has sold steadily though not on a large scale. Sawn wood has moved in very fair quantities, prime wood in particular finding ready buyers. Lumber of good quality has sold more freely.

Birch is quieter, but the lull cannot be viewed unfavorably, after the tremendous disturbance of the strike period. In the packing-case branch of the trade, buying and selling have lately been active. Case makers are very busily employed and the prospects in this branch of the trade are particularly bright at the present time.

At Liverpool, business has got well into swing again and the outlook is more promising. Spruce has been in demand at prices ranging from the recent figures to a shade below them. The consumption of late, though smaller owing to the interruption of business through the strikes, is considered to have been remarkably good under the circumstances and to indicate a sound and healthy state of trade.

At Manchester, deliveries from yards have gone on briskly for a fortnight past, and consumption is more active. Builders are well employed and an improved demand for yellow pine for joiners' work exists. Floorings are in moderate demand. The prices of these woods are practically unchanged.

Pitchpine has been taken more freely, good pine sidings especially being wanted. More timber could have been sent inland from Manchester had the railway trucks been available to convey it. On the north coast business is now active. At West Hartlepool more orders for softwood lumber have been received, while in the pit-prop branch deliveries have been on a larger scale and are still going on briskly. Stocks generally are rather small for the season.

At Glasgow, activity in shipbuilding is maintaining a good demand for shipbuilders' timber. Whitewood has been more called for, while spruce and pine lumber have sold steadily though in moderate quantities.

Wood Houses:—An old use of wood in the United Kingdom, which has become gradually smaller in recent years, is likely to be revived. This is the use of material for the construction of "all wood" houses. Of late years wood has only been used for temporary houses of the very small cottage or "hut" class, such as contractors erect for their workpeople in localities in which there is a dearth of suitable houses. In such cases a row or two of small cottage houses are usually built, wholly of wood, for the workpeople. Temporary houses have also at times been put up for the accommodation of troops, but no general building of wood houses as permanent residences has gone on for a long period. A short time ago the Billericay Rural District Council came to the conclusion that houses wholly of wood might be erected with advantage in their area, as dwellings for working-class families. The council inquired from the Local Government Board if any objection would be taken by the Board, to the erection of dwelling houses of wood. The Board have replied that they were prepared to consider proposals for the erection of timber built cottages by the council, providing such proposals were in accordance with local by-laws. This opens up the prospect of a new departure in house-building. Many country districts exist in England, and indeed, in Ireland, Scotland and Wales, in which wood cottages might be built with much advantage to working class families, compared with the small, tumble-down places which now exist in many country districts; well-built wood houses would be a boon to such families. There is scope for a large use of wood in the U. K. for this purpose. Light planks for main uprights, scantling of ordinary sizes as roof supports, tongued and grooved boards of ¾-in. and 1-in. for walls, floors and linings; and light battens will be required for the constructional work of such houses, and yellow pine, chiefly of 1¼-in. and 1-in for doors, stairs, cupboards and shelves as internal fittings.

Wood Paving:—The Town Council of Southport, a popular and stylish watering place on the coast of Lancashire, have decided to pave their main street—Lord street—with creosoted yellow deal blocks. Tenders for the work were applied for, and the tender of the Improved Wood Pavement Company, Limited, has been accepted. An application is now being made by the Council to the Local Government Board for permission to borrow £6,000 with which to pay for the work.

The Southwark Borough Council (London) have been one of the pioneer councils to use wood blocks for street paving. A comparatively large area of the council's thoroughfares has been paved with wood. The council are now pioneering again; this time in the economics of wood paving. The wood blocks which have formed the pavement in the Old Kent Road and in Newcowen street in the council's area, to the number of about 130,000, are being taken up and will be put through a Phillips' machine and be pared and re-dressed, and then will be used again. The blocks are of Jarrah wood, and have been in use from twelve to sixteen years. It is expected that when the blocks have been re-dressed and re-laid they will last quite as long as they have already been in use, so that a useful "life" of the blocks in question, of twenty-four to thirty years is now being counted on. The behavior of the blocks in their new and second estate, will be closely watched. Should the blocks wear as well as is expected, the result will have an important effect on the future use of wood blocks in English cities.

Trade Optimism at Montreal

Montreal, Sept. 25.—Judging from inquiries among dealers, there is a general feeling of optimism as to the immediate future of the market. Here and there one comes across a dealer who takes a gloomy view, but in the main prospects are declared to be rosy. "I have absolutely nothing to complain of," said one man; "business is flourishing, and I look for a continuance of this condition." On the other hand, another man said that there was only a fair amount of local trade, but low grades were very brisk. Prices are maintained, with a slight advance here and there. Common pine is becoming a strong competitor of spruce, and at about the same price is preferred by the builders.

According to one wholesaler, culls are looking up, prices being firmly held; indications, indeed, point to a generally strong market.

Dry spruce flooring is becoming scarce, with prices high. The lath market is also holding firm.

Although the building permits have lately shown a falling off, there are many more smaller buildings than last year, and this accounts for the increased local demand for lumber.

Hardwoods are enjoying a good market, there being a satisfactory request for local and general accounts. This applies particularly to birch. One dealer reports a better demand for Quebec Province than for Ontario.

There has been a larger inquiry for dimension lumber, although there is still a complaint that prices are too low.

Whatever may be the cause, the amount of export business done with the United States has undoubtedly looked up, and there has also been a considerable addition to the inquiries, due in part, no doubt, to the usual increase which takes place in the fall. The sales

of spruce have been on an appreciable scale, and a nice trade in shingles has also resulted. Quotations, too, have kept firm.

Business in chemical pulp has not recovered from the usual summer dullness, but there are indications of a distinct improvement in demand with a steadying of prices. In ground wood pulp, trade is excellent, although New England points have received rains which have increased their water power sufficiently to manufacture a larger quantity of their own ground wood pulp. There has been a difficulty in securing barges in New England owing to the transportation of hay.

Throughout Quebec, and especially in the northern part of the province, water power is still low.

The effect of the British strikes is still being felt, one result being a congestion of lumber awaiting shipment. As is usual at this time of the year, export business is brisk, dealers rushing over all the stuff they can before the close of navigation. Prices show practically no alteration.

Mr. R. J. Hutcheson, president of the Muskoka Wood Manufacturing Company, Limited, Huntsville, Ont., who has recently returned from a successful and enjoyable business trip to the Pacific coast, reports that business in all lines appeared to be very good. Above all he found it particularly good in the hardwood flooring line in all the principal cities west of Sault Ste. Marie. Mr. Hutcheson reports that the Muskoka Wood Manufacturing Company expect to enlarge their factory and storehouse this fall, though they have not yet completed arrangements as to the actual changes.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The Ottawa Fair a Success

The Central Canada Exhibition which was held at Ottawa from September 8th to 16th proved a great success. The attendance was far ahead of any previous season, 175,000 having been registered at the gates. From a lumbering standpoint the exhibition proved most interesting, many manufacturers of supplies having splendid exhibits. Among those noted by a representative of the Canada Lumberman were the following:

An exhibit of special interest to lumbermen was that of the Craig Mixer Limited, of Ottawa. This company have put on the market a new mixer for making molasses feed for horses. The machine itself stands some ten or twelve feet high and consists of two galvanized iron shutes, molasses tank and return blade mixer and roller crusher, operated by an engine. One of the best features of this new mixer is that it is capable of extracting every particle of sediment from the grain fed into it—insuring a positive prevention of colic. The mixer also adds at least 10 per cent. to the efficiency of the work and gives more longevity to the animal. The actual saving of wheat and bran mashes is so great that the machine will pay for itself many times over in a short time. The machines are made up in two sizes—the larger of the two is capable of mixing and crushing feed at the rate of two and one-half tons per hour, while the smaller, operated by hand, with a capacity of catering to about 30 horses or head of cattle, will mix 500 pounds per hour. Mr. R. H. Driscoll, the well-known lumberman, of Bear Lake, is president of the new company. The mixer is specially adapted for use in lumber camps.

The Butterworth Foundry Company, Limited, of Ottawa, had a fine exhibit in charge of their manager, Mr. C. A. Connor. The well-known Diamond line of camp ranges, manufactured by this firm, is becoming very popular with the lumber camp trade. This year Mr. Connor is adding several improvements to the Diamond Shanty Steel Range. "Thirty-five years in business and still growing," is the successful record of the concern.

The A. J. Barton Saw Company, who now have an office and show room at Ottawa, had a good exhibit of their well-known line of saws. This firm report a very successful season among the trade.

The National Manufacturing Company, Limited, of Ottawa, showed a full line of their different stoves and ranges, among which was the Algonquin Steel Shanty Range, which for lumber and mining camps is finding great favor.

The General Supply Company, Limited, of Ottawa, were well represented with a line of pulleys, belting, machinery, etc.

"Atlas Crude Oil Engines"

The Atlas Engine Works, Indianapolis, Ind., have issued a bulletin "No. 201" dealing with the "Atlas Crude-Oil Engines" (Diesel type). These engines are built in 2, 3 and 4-cylinder vertical units, respectively 300, 450 and 600 B.H.P. The Diesel type oil machine is an internal combustion (not explosion) engine operated with crude or fuel oil, costing 2c per gal. (a little more or less in some localities). The company claim that on a basis of 2c per gal. for the fuel, the cost of current produced by an Atlas oil engine is less than 1c. per K.W.H. An interesting fact in connection with these engines is that the company sell them under definite guarantee of fuel consumption.

"Tiger" All Steel Camp Bunks

The "Tiger" all steel bunk here illustrated is something new in equipment for use in logging camps, and is attracting unusual attention both in Canada and in the lumber districts in the United States. It's strongest appeal is probably because of its being so completely sanitary. It is constructed entirely of steel, the frame work being made of very strong angle steel and the comfort for the occupant is provided in a wire link fabric, combined with helpful springs, which makes an elastic, pliable surface. The wire used in the links is sufficiently large to prevent any possible breaking from rust or abuse. The "Tiger" bunk is constructed in such a way that by the removal of a few bolts it can be taken apart and moved from camp to camp. It is made in the single deck design as well as the double deck, as here illustrated, and can be made in any width desired, either for one, two or four men. It is practically indestructible.

A Popular "Defiance" Machine

The Defiance Machine Works, manufacturers of patent woodworking machinery, Defiance, Ohio, U.S.A., include among their excellent products a 24-inch patent, four roll single surface planer, which will appeal strongly to all woodworking institutions. It is designed for accurate planing of hard or soft wood up to 24 inches wide, and from 1/16 inch to 6½ inches thick. It will prove of especial value to furniture and piano manufacturers, pattern makers, and others who require smooth and accurate work. The frame is a single casting of sufficient strength to support the working parts properly. The table, in one piece, is gibbed to the frame at the four corners, and supported in the centre on either side upon two heavy steel screws. The cylinder of forged steel is accurately balanced and is driven by a 6-inch belt. The feed is driven from the cutter head spindle. It can be instantly arrested while the machine is in motion by a single movement of a convenient hand lever. To drive the machine 5 horse-power is required. The floor space occupied is 36 x 54 inches.

Worcester, Mass. They describe grinding wheels which certainly should be of particular interest to users of wheels for saw gumming and tool grinding, and should be in every filing room.

Another booklet just issued by this company which is of particular value, is one illustrating and describing various protection devices used in connection with grinding wheels and grinding machines. It is not a catalog, but a booklet that will prove to be helpful and valuable to every grinding room foreman, or in fact, to any one using grinding wheels. The company will mail it on request.

SHINGLE EXHIBIT OF
The METIS LUMBER Co PRICE, QUE. CANADA.
W.J.SMITH, Weston Ont. Representative for Toronto & Western Ontario.

An Interesting Shingle Exhibit at C. N. E. Toronto

A booklet entitled "Alundum-crystolon Grinding Wheels" contains suggestions on the selection, care and use of wheels and a brief description of the two abrasive materials used in the manufacture of this company's product. Both of these abrasive materials are manufactured products made in electric furnaces, operated by power furnished by the hydraulic power plants of Niagara Falls. The Alundun plant is located on the American side and the Crystolon plant at Chippewa, Ont., Canada.

Practical Grease Cup for Sawmills, etc.

The Peterborough Lubrication Manufacturing Company, Limited, showed a fine line of their Philadelphia grease cup in connection with the exhibit of the Commercial Oil Company of Hamilton at the Canadian National Exhibition at Toronto. This cup is specially adapted for sawmills and woodworking establishments. The company state that it is the only automatic grease cup on the market in which compressed air is the feeding force, and that it is guaranteed to save from 33 1/3 to 50 per cent. (with any standard grease) over any other system of lubricating machinery bearing.

Canadian Fairbanks-Morse Company

The Canadian Fairbanks Company have secured letters patent from the Dominion Government authorizing them to change the name of their company to the Canadian Fairbanks-Morse Company, Limited, and to increase their capital from $900,000 to $2,600,000. They have also secured the entire capital stock of the Fairbanks-Morse Canadian Manufacturing Company, Limited, which will hereafter be operated as a manufacturing department instead of as an independent corporation. These changes have been made necessary by the increased volume of the business of the company and will greatly increase their facilities.

The corporation of Peterborough, Ont., have recently installed a side suction centrifugal pump, in their waterworks. The pump was supplied by the Smart-Turner Machine Co., Ltd., Hamilton, Ont.

The J. C. McLaren Belting Company, Limited, have removed into a new and extensive factory on Beaumont Avenue, Montreal. Machinery of the most modern type has been installed.

The following from a United States exchange shows that a good action is sure of widespread apppreciation: "The Canadian Pacific Railroad Co. is a remarkable institution, judging it from any standpoint. It is as much a part of Canada as Alberta. While at times its policies and tariffs come up for severe censure, nevertheless, the Canadian Pacific Railroad has been the most potent and forceful factor in the development of the Dominion. In order to stimulate the movement of lumber to the Prairie Provinces from British Columbia before the shipment of grain commences, it has entered into an agreement whereby the retailers will not have to pay the charges for the transportation of lumber ordered until November 1st. By the adoption of this plan it is hoped to move the bulk of the lumber before the grain movement monopolizes the freight equipment of the road. The grain tonnage tributary to the Canadian Pacific Railroad lines will be the heaviest in the history of Canada. The inauguration of this statesman-like and business-like policy is to be commended and is worthy of emulation by the American roads under similar conditions."

Miscellaneous Lumber News and Notes

The regular meetings of the Montreal Lumber Association will be resumed on Monday, October 2nd.

Mr. R. H. Alexander, Vancouver, B.C., has been appointed one of the trustees of the West Coast Lumber Manufacturers' Association, which was recently formed by the amalgamation of the Oregon and Washington Lumber Manufacturers' Association, the Pacific Coast Lumber Manufacturers' Association and the South West Washintgon Lumber Manufacturers' Association.

The statistics for August of the timber branch of the department of lands, British Columbia, show total revenues for the month of $188,379.10, the various heads of receipts being as follows. Timber licenses issued for lands west of the Cascades, 533, producing a revenue of $80,080; for lands east of the Cascades, 679, $82,419.10; coal prospecting licenses issued, 222, $23,700; timber license transfers, $170; and penalties, $1,500.

Mr. William K. Trower, secretary-treasurer of the Riordon Paper Company, Limited, Montreal, has been appointed manager of the Robins Company, Limited, Toronto. He was connected with the Riordon Company for eight years and on leaving was presented by the officials and office staff with an address expressing their regret at losing his services and wishing him every success in his new position. He was also the recipient of a diamond pin and a gold headed cane. Mr. Trower is succeeded by Mr. Charles E. Read, of Ottawa, a director of the company.

At the close of the three months ending June 30, 1911, the tonnage under construction in the British shipyards aggregated 1,476,394 tons, which was 26,000 tons more than the highest previous record of September, 1901. There were 102,000 tons more under construction in the quarter ending June 30, 1911, than in the preceding quarter, and 385,000 tons more than in 1910, and almost exactly double that of 1909, when the total was 745,000 tons. It is a significant fact that the tonnage under construction in the United Kingdom on June 30, 1911, was more than twice as much as the tonnage under construction on the same date in all the rest of the world. The export of new ships from British yards, other than for war, also made a good record for the first half of this year.

Scene at Sarnia, Ont., during recent fire in which lumber belonging to Le Bel Turnbull Company, Ltd. and F. McGibbon & Sons, was destroyed.

John Appleton, of Appleton & Sewall Company, 156 Fifth Avenue, New York, has recently negotiated the sale of several large wild land tracts in Maine. This company is making a specialty of buying and selling explorations, and can furnish reliable data quickly and at a reasonable cost.

Vehicle and Implement Wood Diminishing

The supply of domestic woods used in the manufacture of vehicles and agricultural implements in Quebec is rapidly diminishing. In this district, for instance, there is scarcely a sufficient quantity of cherry, ash, and hickory to meet the local demand of the wagon makers; other varieties combining the technical qualities required in these industries are now to be found, in small quantities, in the remote farming districts of the province, and these woods are expensive by the time they are delivered to the manufacturer. The forestry branch of the Canadian Department of the Interior has been collecting statistics from the agricultural implement and vehicle manufacturers of the Dominion, and these show that 76,474,000 feet of lumber were used by 162 companies, located in six provinces, during the past year, the aggregate value of same being $2,513,265, and the average price per thousand feet $32.86. Cherry was the most expensive of the native woods, at $104 per thousand feet, and ironwood was the cheapest, at $15 per thousand feet.

A Valuable Publication

The Annual Financial Review,—Published by Houston's Standard Publications, 7-9 King street, east, Toronto, is a carefully revised summary of facts regarding securities listed on the Montreal and Toronto stock exchanges, and other prominent Canadian companies. It includes the current annual statements of companies, the highest and lowest prices of stocks and bonds on both exchanges, for each month, for 10 years; number of shares sold each month for the past 15 months; rates of dividends paid for past years, and other important items in the history of the different companies, such as increases in capital stock, particulars of franchises, when bonds ars redeemable and dividends payable together with a mass of other facts. The work is very valuable, not only to financial institutions but also to the general investing public. It is published half-yearly, in April and November.

The Appleton & Sewall Company, Foresters and Surveyors, of 156 Fifth Avenue, New York, are at present completing the survey of 100,000 acres of timber land in Nova Scotia. The land is laid out in sections by base lines from which the men engaged in estimating travel in parallel strips. Thus a very good idea of the topography and the timber is obtained. The work so far has been most successful and three months will be all the time used in completing the field work. Two maps are to be made, one showing permanent features such as topography, streams, railroads, roads, camps, etc., while the other will show the location of the timber, its quality, and character. Thus the whole situation can be seen from a comparison of the two maps.

More Power Means More Profit

USE "AMPHIBIA" BELTS

¶ Anything making for more power or less friction is of much interest to all belt users.

¶ To get the most possible power, speed and economy from belts is a problem we have studied for thirty years, and now we produce a practically perfect belt.

¶ "Amphibia" Belts will do more than just ordinary belts and with less cost for up-keep.

There is an "Amphibia" belt for every purpose.

¶ "Amphibia" Belts are waterproof. They are not affected by steam, water, damp air or any similar adverse conditions. We guarantee them against opening of laps through exposure to water or steam.

Your Chance to Prove "Amphibia" Efficiency

¶ If you are contemplating the installation of any transmission equipment let us advise you more fully as to the efficiency of "Amphibia" Belts.

¶ Send us your enquiries. We can be of help to you. We agree that you first prove "Amphibia" merit before any cost to you.

ECONOMY OF OPERATION

is ONE of the essentials to be considered when comparing initial cost of a steam LOG LOADER

Average cost of loading Logs with above "AMERICAN" LOG LOADER purchased nine years ago 10½c. per 1000 feet, everything included.

(Watch for our next ad)

AMERICAN HOIST & DERRICK COMPANY
ST. PAUL, MINN.

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by $\frac{1}{3}$ to $\frac{1}{2}$ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with $\frac{3}{4}$ in. to $8\frac{1}{2}$ in. bore.

EDGINGS

Ontario

The stock of lumber belonging to David Conklin at Kingsville, Ont., was destroyed by fire recently.

The lumber and coal stock of A. J. Clatworthy, Granton. Ont., suffered considerable loss by fire recently.

The sawmill at Bewdley, Ont., owned by John Smith, was struck by lightning and burned to the ground recently.

The Grand Trunk Railway will build a number of new day coaches in its car works at London, Ont. About 50 coaches will be built. Thomas Treleaven is the superintendent.

The Muskoka Wood Manufacturing Company, Limited, Huntsville, Ont., are arranging to enlarge their factory and store house during the present fall. Definite arrangements have not yet been made.

The New Ontario Timber and Trading Company, Limited, Bruce Mines, Ont., have been incorporated with a capital of $50,000. The provincial directors are T. H. DeCew, lumberman, Bruce Mines, Ont, and J. A. DeCew, chemical engineer of Montreal, Que.

During a severe electric storm the sawmill owned by Mr. T. B. Chalk at Bewdley, at the head of Rice Lake, Ont., was struck by lightning and totally destroyed, with all the machinery. Several piles of lumber were also burned. There was no insurance and Mr. Chalk's loss is consequently heavy.

The factory which is to be erected at Port Arthur, Ont., by the Port Arthur Wagon Works, Limited, will be 400 x 100 feet partly one storey and partly two storey. It will include a dry kiln, machine shop, assembling shop, etc. It is expected that the factory will be in operation by February next.

Wright & Carroll Investments Limited, Toronto, Ont., have been incorporated with a capital of $100,000 to acquire, develop &c. pulp and timber limits, and carry on a general mining, milling and development business. G. Wright, M. Carroll and J. G. O'Donohue, all of Toronto, are provincial directors.

The Canadian Fibre Wood and Manufacturing Company, Limited, Toronto, have been incorporated with a capital stock of $40,000 to construct, build and operate pulp, paper and lumber mills and to carry on a general pulpwood, lumber and timber business in all its branches. The provincial directors are B. Balfour and W. Burrows, both of Toronto.

The mills of the Howard Cooperage & Lumber Company at Ridgetown, Ont., were destroyed by fire on Sept. 12. The plant has been closed for the past two or three years on account of the scarcity of timber, but was opened last spring by Mr. T. J. Johnstone and the Leitch Brothers, and was employing a large number of hands. The entire plant was completely burned and the machinery ruined. The loss will be large. It is unlikely the plant will be rebuilt.

The McAuliffe Davis Lumber Company, Limited, of Ottawa, have just completed a large new shed in connection with their Chamberlain avenue mill. The shed is 250 feet long by 100 feet wide and is steam heated. Down the centre is a wide driveway. On one side the lumber is received from the cars and passes on to the planing mill, the finished product coming out from the mill at the opposite side of the shed, where it is stored in large bins. Every modern improvement for the handling of the lumber is installed, which makes it one of the most up-to-date in that vicinity.

R. Laidlaw and Company, Toronto, have bought the planing mill and lumber business of W. F. Lawrence & Sons at Sarnia, Ont. The business will be developed considerably and a number of improvements will be made to the plant, which will include, in the first place, the construction of a new wharf, so as to enable the company to handle the lumber more rapidly and satisfactorily. All the former employees of the Lawrence firm have been retained by the new owners and a number of additional employees will be engaged. Chester H. Belton of Sarnia will have charge of the business.

Eastern Canada

The liquidators of the Nepisiguit Lumber Company are offering for sale a large quantity of lumber woods supplies.

Chas. Durocher has registered as C. Durocher & Co., to carry on the business of a sash and door factory at Iberville, Que.

Letters patent have been granted to the Nashwaak Lumber Company, Limited, with head office at Marysville, N. B., and capital stock of $3,500,000.

It is reported that the Nepisiguit Lumber Company, Limited, manufacturers of lumber and shingles, have sold their property to The Adams Burns Company, Limited.

The Grand Trunk Railway has given a contract to the Canadian Car Foundry Company, Limited, St. John, N. B., for the construction of 1,000 box cars. These cars will have a capacity of 60,000 lbs., and will be 36 feet by 9 feet 3 inches.

"G. R. E. Kennedy, Limited" has been incorporated at Sherbrooke, Que., to purchase the assets of G. R. E. Kennedy, mining broker, and among other things to deal in timber limits, timber lands, etc. The capital of the company is $20,000.

The Belgo-Canadian Realty Company, Limited, Montreal, Que., has been incorporated with a capital of $500,000 to deal in real estate, mining rights, timber limits, timber licenses, water powers, etc. The Provincial directors are Wm. Shaughnessy and C. G. Heward, both of Montreal.

Western Canada

Culleton Bros. are reported to have sold their sawmill at Alberni, B. C., to S. Bartlett.

The Rogers Cunningham Lumber Company, Taber, Alberta, is building a shed and will increase its yard room.

The Red Cliff Land and Lumber Company, Limited, Vancouver, B. C., have been incorporated with a capital of $400,000.

The Peachland Lumber and Manufacturing Company, Limited. Peachland, B. C., have been incorporated with a capital of $40,000.

W. C. Elliott has sold his lumber business at Carndug, Sask., to A. A. Johnson. The new owner will take possession on December 1st.

The Lester W. David Company, Limited, manufacturer and wholesaler of lumber, shingles, logs and timber, of Vancouver, has opened an office in Winnipeg.

The mill of the Serpentine Lumber Company, five miles from New Westminster, B. C., has been destroyed by fire. The loss amounted to $5,000. The mill will be rebuilt.

The Lookout Lumber Company, Limited, 1118 Langlay street, Victoria, B. C., have been incorporated with a capital of $300,000, Frank Higgins, Barrister to be the attorney.

It is expected that the large pulp mill at Ocean Falls, B. C., will be ready for operation in November. The mill will then have a daily capacity of 150 dry tons of mechanical pulp. Provision has been made to double its capacity if this is found advisable in the future.

It is reported that the Canadian Western Lumber Company, Fraser Mills, B. C., will shortly commence operations upon the enlargements to their plant which were recently announced. It is reported that a complete shingle mill and sash and door factory are to be built at a cost of $300,000.

The Vancouver Timber and Trading Company has closed a deal with the Red Cliff Lumber Company of Duluth for the purchase of some 30,000 acres of crown granted timber lands on Vancouver Island. The timber on this tract is estimated at close on two million feet of first-class merchantable timber.

The Upper Fraser River (British Columbia) Lumber Company, Limited. has been authorized to carry on business within the Province of British Columbia. The Provincial office is situated at 615 Hastings street, Vancouver, David Gordon Marshall, Barrister, is attorney, and the head office of the company is at Montreal, Que.

The Interior Construction Company, Limited, has been incorporated under the statutes of the Province of Manitoba. The head office is to be at Winnipeg and one of the objects of the company is to build and operate pulp and paper mills. The incorporators include C. H. Forrester, D. MacLean, S. J. Kilpatrick and A. K. Dysart, all of Winnipeg.

It is stated that the Larson Lumber Company of Bellingham, Wash., have recently purchased 7,813 acres of timber land in B. C., and will undertake logging operations on a large scale. Their proposed plans include the building of a standard gauge railway several miles long from tide water to Haslam Lake and it is reported that they will take out 25,000,000 feet during the first year.

More British capital is being invested in timber projects. A party of London capitalists recently completed the purchase of twenty-seven square miles of timber land on the west side of Cowichan lake. Vancouver Island. Sir John Barker and six others are in the syndicate. He stated that they were prepared to consider timber propositions in other parts of the province, so satisfied are they with the results of this deal.

The new mills to be erected by the British Canadian Lumber Corporation at New Westminster, B. C., will be commenced at once and it is hoped to have the plant in operation by January 1. The cost of the new mill is to be $500,000 and it is to include a box and door factory. The capacity of the mill will be 250,000 feet per day. The machinery is to be electrically driven. The plant will employ about 300 men. The capacity of the company's mill at Coal Harbor has recently been increased to 130,000 feet per day.

The Dominion Saw Mills & Lumber Company of Revelstoke, which was organized over a year ago, with a large capital by British investors, is said to have secured options on 100 retail lumber yards in Alberta and Saskatchewan. The holdings of that company comprise approximately 400 square miles of timber lands in and tributary to the valley of the Columbia river. The company operates four well equipped saw mills, and several lines of standard logging railroads, while plans are in preparation for a fifth mill of large capacity.

Trade Inquiries

The Dominion Government, Trade and Commerce reports contain the following trade enquiries. Readers of the Canada Lumberman may obtain the names and addresses of enquirers by writing to the Department of Trade and Commerce, Ottawa.

786. **Timber.**—A London firm of timber agents is desirous of extending their import trade from Canada; they are also open to hear from owners of timber properties.

799. **Compressed wood shives.**—A Lancashire firm make inquiries for the names of Canadian manufacturers of compressed wood shives.

800. **Birch framework.**—A London manufacturing firm ask to be placed in communication with Canadian manufacturers of birch framework for deck and similar canvas chairs. Material is required cut and shaped ready for simply putting together.

810. **Saws, tools, etc.**—An old established well known firm wishes to appoint an agent for the whole of Dominion of Canada.

815. **Paper, strawboards (lined and unlined), wood pulp.**—A Dunedin, N. Z., firm would like to act as manufacturers' agents for above. Can give good references, and plenty of business.

818. **Oak, walnut, canary white wood, etc.**—A South African firm of manufacturers' agents desire to communicate with Canadian suppliers and shippers of oak, walnut, canary white wood, and any other woods used for cabinet making purposes.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

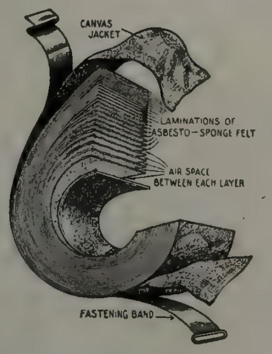
SPECIAL RATES TO LUMBERMEN

Steam Carried a Mile with Practically No Loss



CANVAS JACKET
LAMINATIONS OF ASBESTO-SPONGE FELT
AIR SPACE BETWEEN EACH LAYER
FASTENING BAND

In a recent test made by prominent engineers, steam at 350 degrees Fah. was carried through an outside temperature of 60 degrees Fah., in pipes insulated with J-M ASBESTO-SPONGE FELTED PIPE COVERING, for a distance of 5,356 feet, or over a mile, with a loss of only 10 horse-power. This was but 2.65 per cent. of the 375 horse-power engine, carrying 120 lbs. steam.

J-M Asbestos-Sponge Felted

is the only pipe covering which has such remarkable insulating properties, because none other confines such a great amount of dead (motionless) air, which is the secret of insulation.

J-M ASBESTO-SPONGE FELTED is also the most indestructible covering on the market. It will not crack, break or lose its insulating value from vibration or rough usage.

Write nearest branch for sample and booklet.

Owners-Millmen-Filers

THORNTON CLANEY LUMBER CO

read our "BERLIN QUALITY" monthly

BULLETIN OF IMPROVEMENTS ISSUED MONTHLY BY THE BERLIN MACHINE WORKS.

Not a trade-paper, but a monthly bulletin of improvements made by this company in the wood-working field.

This little publication is being read by the most progressive owners, mill-men and practical men in all parts of the country.

The July paper contains articles by practical superintendents and operators on subjects of vital importance in the handling of machinery with announcements of new machines and new devices by the company.

This little paper is being read widely because it deals solely with the manufacturing side of wood-working and contains articles of intense interest to the mill man who is looked to for results.

A few of the articles in the July issue are as follows:

1. Article on "Band Saw Benchwork,"—C. Hapsburg Liebe.
2. Sanders and the right sandpaper—an article on the right sandpaper for different sanding.
3. The use of the Profiling Attachment—By Chas. Platt.
4. Successful use of thin knives—By Fred Cantin.
5. Resawing hardwood with the Horizontal Resaw—By W. B. Thompson.
6. New Hardwood flooring heads.
7. Development of the fast-feed flooring machine.
8. Slab Resaws and their uses.
9. Motor driven wood-working machinery.
10. Cutting ends automatically in the furniture factory.

A copy of this particular issue will be mailed FREE, to any millman, superintendent, foreman, operator or filer. In writing, state where you are employed. We aim to work with the practical millman by keeping him in touch with the improvements we are constantly making.

"BERLIN QUALITY" Should be Read by Every Man in every Plant.

We have been asked: "Are you interested in the carpenters and the Disston Saws they buy, even after you have their money?"

THIS is a question easily answered. Do you suppose for an instant that we could have retained our regular trade, constantly increasing it, built up and maintained the largest and greatest works of its kind in the world, over a period of seventy-one years, had we not seen to it that the articles we sent out were "making good" and satisfying the user?

LARGEST PLANT IN THE WORLD

We want to force home to you the important fact that our plant is by far the largest of its kind in the world, consisting of 58 buildings, covering 50 acres. We employ 3500 men, and during almost three-quarters of a century—the period we have been in business—very little time has been lost by the employees. You must realise that it requires "some orders" to keep an establishment of this magnitude going.

There surely must be more than ordinary merit in that brand of goods which creates and satisfies the demand over a long period of time.

PROTECTS THE USER

We certainly do want to know if any Disston Brand Saw, Tool or File does not stand up to our guarantee. That guarantee is sufficiently broad to protect the user on every reasonable point. If you have a Disston Saw, Tool or File that has failed you through any cause of ours, let us know, and we will see that you bear no loss on our account.

Each and every article bearing the name DISSTON carries a full warranty as to material and workmanship.

And this guarantee has been in force since the first Disston Saw was made.

There are millions and millions of Disston Brand Saws, Tools and Files in practical use all over the world, which are giving the highest satisfaction. Of course, you will appreciate that almost every individual has his own ideas and opinions and it is impossible to cater to each, particular in cases where they may be prejudice; so our only recourse is to satisfy the majority, and this we have been doing for over seventy-one years—making the goods of superior quality and after designs which have been demonstrated by practical use to be best adapted for the purpose.

It is noteworthy, however, that where we have one complaint, we receive thousands of letters voluntarily testifying to the superior worth and durability of Disston Brand Goods. This speaks for itself.

Neverless, we are always open to conviction, and if a man has complaint to make about any of the Disston Goods, it is but fair and just to us that he enter the complaint; for it is by considering, fully digesting and going into the cause of the trouble, in addition to our constant experimenting and investigations which enables us to so improve and perfect Disston Goods as to bring them up to the highest point of efficiency. When a man has occasion to find fault with any of our goods we do not consider it "a complaint," but a stimulation and a reason for increased vigilance in looking to the safeguarding of the high prestige we have achieved for the name Disston.

MOST PRACTICAL EXPERIENCE

We have the experience—and broad experience at that—extentending over seventy-one years, not only in the making but in the using of tools. Think of the enormous size of our plant; think of its many diversified departments and their ramifications—Steel making, Saw making, the making of various Tools. File making, Wood working departments, Machine Knife making, Machine Shop. Think of the enormous quantities of tools and materials we buy from the outside and think of the great quantity of tools of our own make that we use. When you consider all these points, it will give you some idea of our experience in the manufacturing and use of tools. And that experience we make Count in the perfecting of our manufacturing facilities and the increased efficiency of our own brand of goods.

MADE FOR EFFICIENCY

In the Disston Brand Saws, Tools and Files you have the advantages of the product of a progressive, up-to-date factory, the Largest in the World. Where the goods are made throughout, from the making of the steel itself—the superiority of which has been demonstrated for the past fifty-six years—to the finishing operation; and each process is performed by mechanics of long experience and highest order of skill.

We want to say to you, and say it positively, that Disston Goods are made not merely to sell, **but for practical use.** All materials used are of highest grade; the steel is properly hardened, tempered, and ground under the Disston exclusive processes; each article carefully inspected at various stages of the work, and finished in a workmanlike manner. **We Fully Guarantee them to be of Highest Efficiency and Unequalled.**

WE ARE INTERESTED

Reverting to the question:—Yes, we are interested in the carpenters and all other users of our tools, as well as the tools themselves after they have been bought and put to use. For we take great pride in the successful results they have achieved in the working, and fully realise—have realized for years—that the world-wide reputation we have earned can only be maintained by furnishing goods of the highest efficiency.

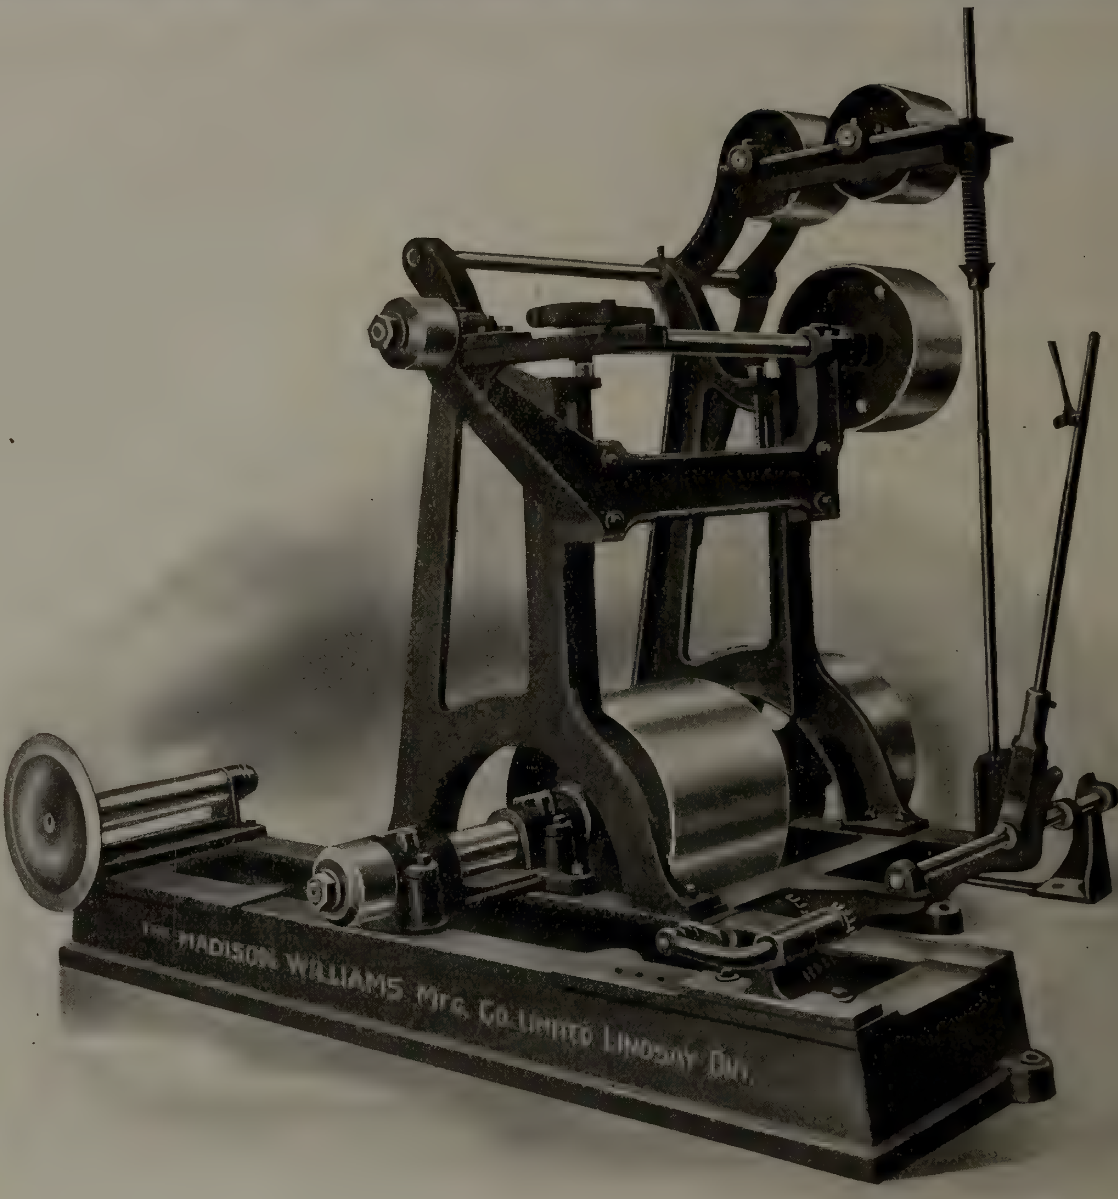
Keystone Saw, Tool, Steel and File Works

PHILADELPHIA

Saw Frame and Top Saw



No. 4 Iron Saw Frame and Top Saw

THE HUSK OR SAW FRAME is box pattern, heavy and substantial, the end projection for lumber roller and saw guide being cast solid therewith. The Saw Arbor is hammered steel $3\frac{7}{8}$ in. diameter, which is supported in three wide babbitt bearings. The two bearings near the saw are connected, the lower half of each box and the connecting webb being cast in one piece for the double purpose of convenience in adjusting and providing a rigid and effective means for holding and taking up the end play of the mandrel. This end play of mandrel is taken up or regulated at the middle of the mandrel, by a set collar on one side and the hub of pulley on the other. The standard size drive pulley is 26 in. diameter, 16 in. face, but frame will take in a pulley as large as 30 in. diameter, 25 in face. The Rear Lumber roller is furnished with steel revolving spreader.

A GUERNSEY SAW GUIDE is supplied with this frame which is constructed in such a manner that the outside arm can be instantly turned up or back so as to allow the removal of the saw from the Arbor without the trouble of removing the outside arm of the guide from the standard or changing the position of the guide upon the frame. The arms, which are made of steel, are moved independently of each other by hand wheels, and even when the saw is in full motion can be adjusted without the use of a wrench and without danger of accident to the sawyer. Largest size saw that can be used 72 in. Weight 2500 lbs. Flocr space 7 ft. x 8 ft. 6 in.

THE TOP SAW FRAME is made very heavy and is securely bolted to the saw frame. THE MANDREL which is 2 7-16 in. diameter, hammered steel, is carried in one casting containing two wide babbitt bearings. This casting is machined and fitted to uprights, and is raised or lowered by means of hand wheels and screws. THE TIGHTENER FRAME, carrying two pulleys 12 in. diameter, 9 in. face, is operated by lever, and the arrangement is such as will allow the top saw to be stopped or started at will, or the tension of the belt increased. These tighteners give the saw a reverse motion. Size of Mandrel Pulley 18 in. diameter, 9 in. face. The top saw frame can be adjusted to carry 72 in. saw on lower mandrel and 36 in. on upper, or 40 in. saw on lower and 24 on upper. Weight 1800 lbs.

Have you our literature? You should have it.

Forest Maps

The mapping of timber lands is recognized as a most important piece of work by Pulp Companies and timber land owners, in the economic handling of wild lands. We furnish topographic maps which show fifty-foot contours, or actual location of streams, ponds, lakes, roads, trails, and any other natural features of importance.

Accompanying this map is a so-called "Timber Map," showing in colors the distribution of timbers found. These maps, together with the detailed report and estimate, afford the owner of lands an intelligent system for the handling of same.

La Compagnie de Pulpe de Chicoutimi
Chicoutimi, P.Q., Canada,
August 23rd, 1911.

Gentlemen:—

Replying to your favor of August 11th, would say that we have no objection whatever to your using the name of this company with reference to the quality of your work.

After a careful examination of the maps and reports which were the result of your work on the two hundred odd square miles in question, we take pleasure in complimenting you on their accuracy, neatness and generally satisfactory character.

With best wishes for your success in the future,

Yours very truly,
GEORGE C. W. LOW,
Manager Woodlands Department

Messrs. Appleton & Sewall,
156 Fifth Avenue, New York.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts, showing character and quantity of available timber, indicating the most approved methods of cutting each year, so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

INDUSTRIAL LOCOMOTIVES

For logging roads, contracting, quarrying, plantations, and switching about mines and industrial plants, simple, sturdy, powerful and easily maintained locomotives are required. To build them right necessitates knowledge and experience. We know how to build locomotives. We have built them of all sizes and types for all kinds of hauling.

Every piece of material entering into their construction must first undergo a test and meet rigid requirements. This is true of all our locomotives—both large and small.

Interchangeable repair parts are kept in stock at our works at Longue Point, Montreal, Canada.

OILDAG
(REGISTERED TRADE MAKR)
Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super-heated steam practice."

A New Automatic Double Cut-Off Saw with Hopper Feed

The **capacity** of this machine is practically **unlimited.** It will cut off both ends as fast as your operator can throw the stock by the arm-full into the hopper and the off-bearer carry it away.

A large factory cannot afford to be without a No. 291. It will **take the place of at least three** of the old style machines, and do better work.

The small shop too, will find it **a paying investment.**

No matter what kind of a double cut-off saw you are now using, **you will eventually buy a No. 291,** because—

It's the strongest and most simple in construction—**built like a machine tool throughout**—no chance for a breakdown.

It's the only **absolutely accurate** double cut-off saw made. The dogs that move the stock along the slides are screwed into a chain made of milled steel blocks, and each dog has separate **micrometer adjustment.**

The **saws** are **enclosed,** forcing the sawdust directly into chutes which are connected to the exhaust pipes.

The rack and pinion arrangement for changing to different lengths is **more accurate** and **twelve times as fast** as any other.

Countershaft is bolted on the rear of the frame, to give good belt length, insuring **greater driving power and minimum belt wear**—and belts are expensive.

Every **adjustment** is made **easily** and **rapidly.**

You owe it to your business to investigate this new tool.
Write for details and price—it don't obligate you to buy.

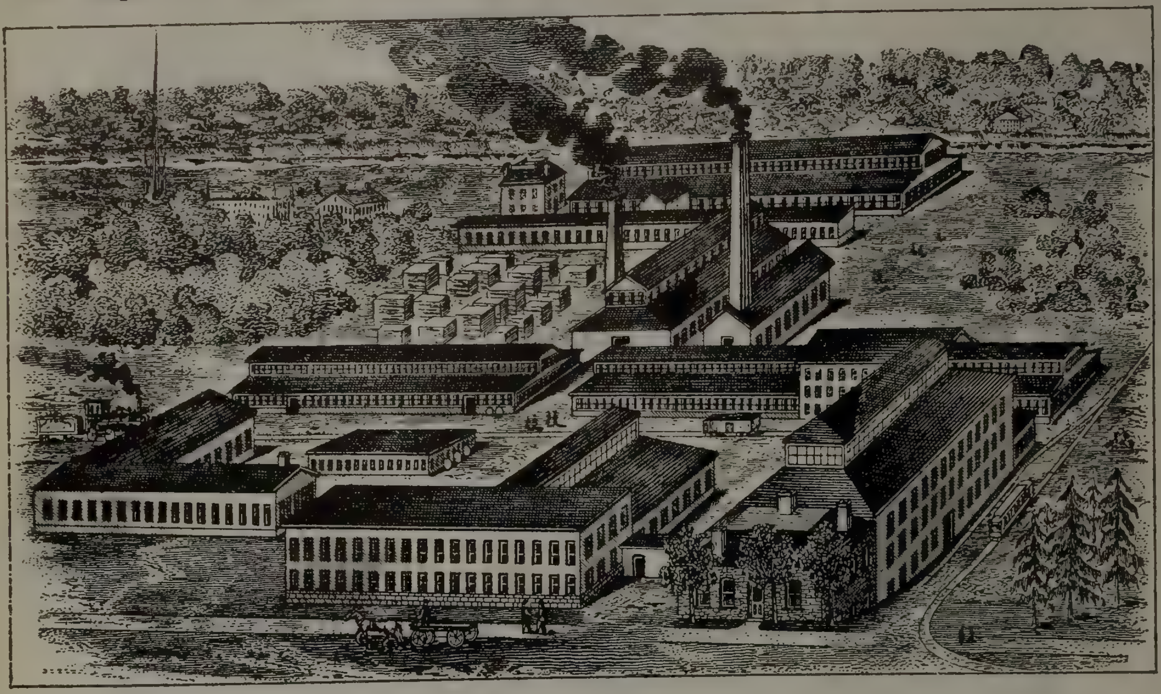
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

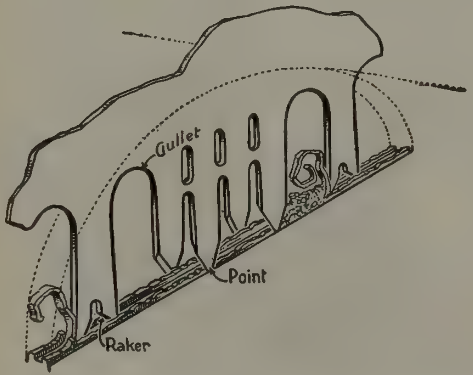


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

The Enviable Reputation earned by

STILL'S AXE HANDLES

Has been built up chiefly by attention to two details:

1. Care in the selection and seasoning of the wood.
2. Skill in the shaping and balancing of the handle.

As a genuine satisfaction-giving line, Still's Handles have no superior and very few equals. The prices will interest you.

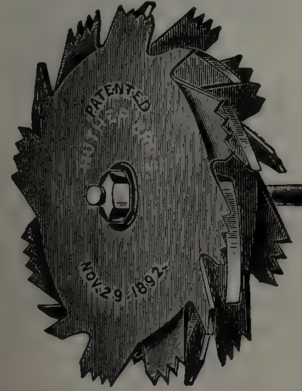
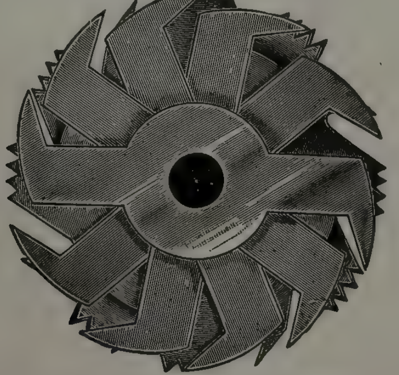
HUTHER BROS. PATENT GROOVER OR DADO HEAD
For cutting any width groove from one quarter inch to 2 inches or over





Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturer of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

An Advance Notice

Next issue we will print on this page an illustrated description of a new 7-foot Bandmill.

Here is a mill that stands between the 6-foot Pony Band and the 8-foot Double Cutting New Model mill recently placed on the market.

It will take a saw up to 12-inch blade.

It is a heavier, faster cutter than the Pony, has all the improvements of the 8-foot mill—steam actuated guide, knife edge tensioning device, bayonet-frame wheel support, etc.

And,—with an equal capacity on smaller logs—

It represents a saving of several hundred dollars in initial cost, in up-keep and in filing tool equipment.

Don't miss this page next issue.

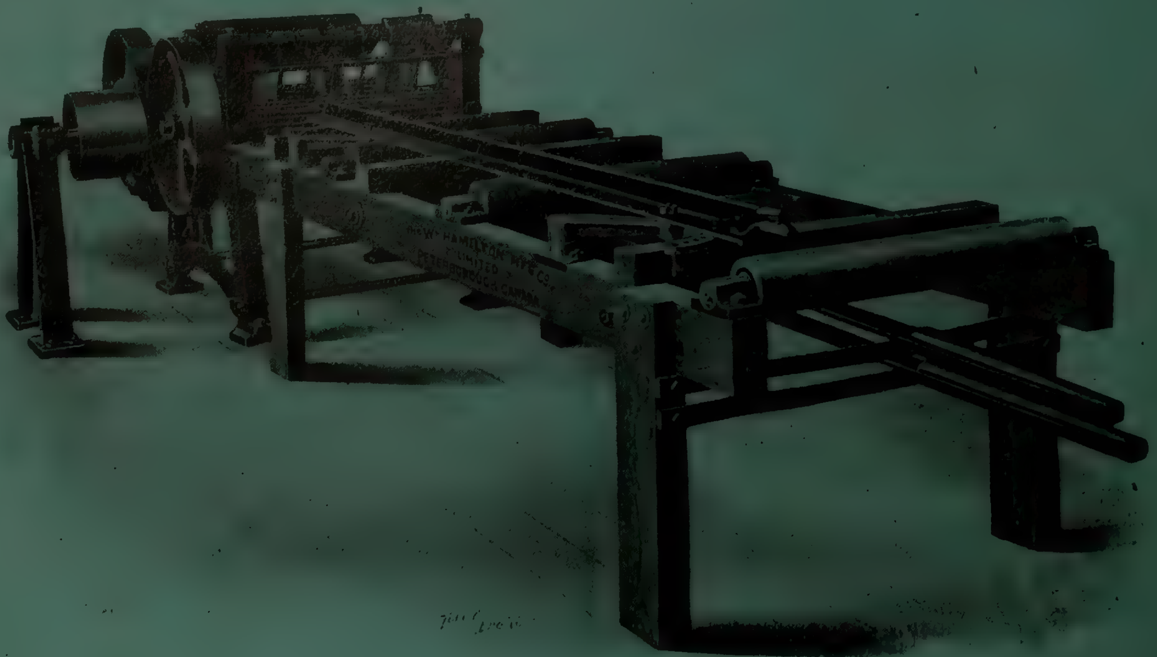
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound ; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows : Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

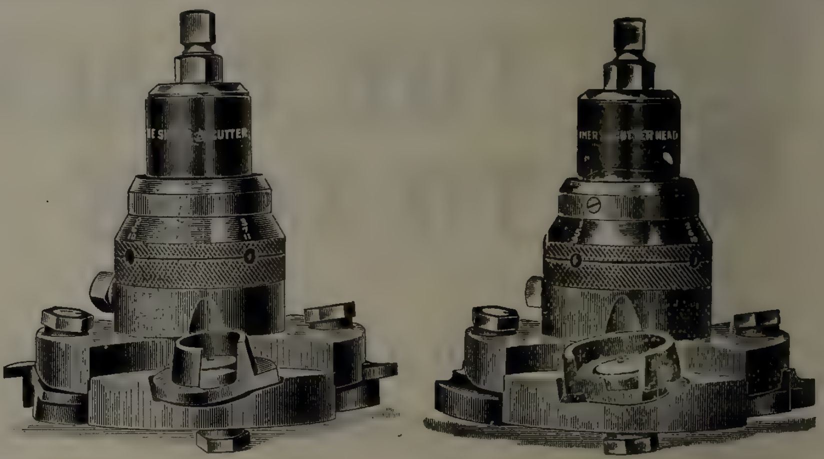
Frequent shut-downs and other annoyances run away with a lot of money that could easily be saved by the use of

The Shimer Cutter Heads



There are many reasons for the popular endorsement of these tools, among which are the proven facts that TIME AND MATERIAL CAN BE SAVED BY THEIR USE.

The "make-ready" built into every Shimer Cutter Head saves filing the cutters to shape at each sharpening—because the Shimer cutters carry the exact shape of the tongue and groove or whatever mould they are to produce. They are filed or ground to sharpen and in an instant of time are moved around their centre holding bolt to a gauge, which insures that every cutter is in its exact position. The "make-ready" also saves taking the Heads off the spindles to make adjustments for tight or loose fitting of the tongue in the groove—a simple turn of the expansion ring enlarging one or making the other smaller as may be desired.

The Shimer Cutter Heads are made on the interchangeable plan and many of the best paying mills have Heads for all classes of work, which are slipped off and on the spindles in a minute's time. Some have duplicates for the same kind of work and one set is sharpened while the other is being used. In whatever way they are worked they will be found to be paying tools.

Our large Catalogue and Pattern Book shows styles for every class of work, besides giving much information of value to the mill man. Send for a copy.

We make a number of Heads for Special Purposes. For any design of material you get out in quantity let us give our estimate on the Head to do the work. Our prices are uniformly low—our goods of best quality.

A Few of the Lines We Manufacture

Make your power transmission an *asset* instead of a *liability*—a money saver instead of a power waster. Belt your machinery with

GOODYEAR

Imperial
High-Speed, Friction-Surface
Belts

"The Belt That Clings"

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre *cotton fabric*, rubberized, cured and vulcanized into one solid, enduring piece.

Earns Cost—Costs Less

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

Wears Longest Without Stretching

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes *internal friction.* This soon wears the life out of best leather belting and is caused by internal *grinding* as the belt bends and whizzes around small high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the *stretch has all been taken out,* rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire and Rubber Co., Akron, Ohio, U. S. A. Write us at once.

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3,00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, October 15, 1911** **No. 20**

Lumber Production of Canada

The value of the lumber, timber, lath and shingle production of Canada, during the calendar year of 1910 was $83,989,197, according to a report which has just been issued by the Forestry Branch of the Department of the Interior. This total is made of lumber, to the value of $77,503,187, timber to the value of $985,255, shingles to the value of $3,557,221, and lath to the value of $1,943,544. Details of the production will be found in another part of this issue of the Canada Lumberman.

Several points of much interest are brought out by this report. One of the most significant features is the fact that there is shown an increase of 28.5 per cent. in the lumber output, amounting to 1,086,707,000 board feet, more than the output of 1909. This is in a measure accounted for however, by the fact that the Forestry Branch, which has been issuing these reports for a few years only, succeeded last year in obtaining statistics from 678 more firms than in 1909. Many of the newly reporting mills however, were small ones, as is shown by the fact that the average cut of the mills reported was reduced from $1,830,000 feet in 1909 to 1,774,000 feet in 1910. Another feature of much interest to the industry is the fact that the proportional increase in the cut of lumber in Canada, and that in the United States was practically identical. The cut of lumber in Canada during 1910 was a little less than 1/9 of the cut of lumber in the United States during 1909. The per capita lumber production in Canada was 653 board feet, or 170 feet more than the per capita lumber production in the United States during 1909.

The most significant fact brought out by the report is perhaps that which relates to the relative importance of the various provinces from a lumber production point of view. It is shown that Ontario still holds its place as the first province in point of lumber production, but that British Columbia will soon take the place of Ontario in this regard. The report upon the average value of the lumber produced, shows that for the whole of Canada the value was $15.81 per thousand feet. Of the various provinces Ontario stands head with an average value for its lumber product of $18.28 per thousand feet; British Columbia second with an average value of $15.32 per thousand feet, and Nova Scotia last, with an average value of $12.66 per thousand feet.

The trend of the industry is clearly shown by the fact that while spruce and white pine formerly made up nearly 3/5 of the total product, in 1910 they made up scarcely ½. This is due, not to a decrease in the cut of white pine and spruce, but to a great increase in the amount of Douglas fir, hemlock, cedar, and yellow pine produced in British Columbia. The prediction made last year that white pine had reached its maximum cut is proven true, for in 1910 it decreased 4 per cent. as compared with 1909. The most remarkable increase was in the cut of British Columbia yellow pine which was 600 per cent. greater than in 1909.

Another feature of interest is the decrease in the price received for lumber during 1910, as compared with 1909. A drop of 60 cents per thousand feet is shown, caused principally by the lower price of spruce and white pine. The price of spruce is reported to have declined by $1 per thousand. The greatest decrease in the price of the important woods was that of birch, which dropped $1.49 per thousand feet, and the greatest increase was in the case of hickory, which advanced by $13.17, reaching the price of $39.61.

Interesting comparisons are given of the relative importance of the softwood, and hardwood industries in Canada. 94.3 per cent. of the total lumber cut in 1910, in Canada was soft wood, and only 5.7 per cent. was hardwood. We imported hardwoods to the value of $7,448,935, an increase of $2,250,000 over 1909. The total value of our hardwood cut was only $4,958,450.

Many other features of interest will be found in the report. Its general importance however, is not so much in the statistics of the total lumber production, as in the information which it affords, as to the trend of the lumber industry. The decreasing importance of the white pine cut, the increasing importance of the spruce, douglas fir and yellow pine of British Columbia, and above all the introduction of new species of wood upon the market, show clearly that the industry is rapidly undergoing an important change which indicates more than anything else, a growing tendency among the manufacturers to utilize everything in the form of wood, which can possibly be made into a marketable product. No less than 5 new varieties of wood are reported as having been manufactured during 1910, namely, chestnut, cherry, tulip, sycamore and alder. Valuable and interesting statistics are also given regarding the products tion of timber, lath and shingles. The timber export trade is shown to hav continued its decrease. Shingles show a slight increase in quantity, but a decrease in price, and the cut of lath showed an increase of 3 per cent., but a slight decrease in value.

The report is replete with interest to the lumber industry, and will be read with profit, by all who desire to obtain an accurate idea of the trend of the trade.

The Extra-Provincial Licensing Act

An interesting and valuable pamphlet on the operation of the Extra-Provincial Licensing Acts in force in the different provinces of Canada has just been issued by the Canadian Manufacturers' Association. The author of this work is Mr. F. W. Wegenast, LL.B., of the Ontario Bar, secretary of the legal department of the above body.

Something of a sensation was caused in the business world last year when the British Columbia Act came into force, but while a severe criticism of this enactment was heard on all sides, the period during which the Dominion Government might have disallowed the Act was suffered to elapse, and now, while many regard the Act as not being worth the paper upon which it is written—so far, at any rate, as it affects Dominion companies, it will doubtless continue to be enforced by provincial authorities until it has been established by either the Supreme Court or Privy Council that it was ultra vires of the British Columbia legislature. It is hoped that a test case will arise in the near future by which the invalidity of the provisions of the Act may be proven, and it is interesting and reassuring to note that the Canadian Manufacturers' Association has undertaken to support such litigation.

It is not only in British Columbia, however, that such an Act is in force. Similar enactments have been passed during the last ten years, by nearly all the provinces. This fact is of the utmost importance not only to manufacturers but to every company in the Dominion carrying on inter-provincial business. The Acts of the various provinces have been analyzed very carefully by Mr. Wegenast, who cites a number of cases showing the arbitrary nature of their provisions. Be it understood that, in the majority of the provinces, a company doing business without a license is not only subject to a large penalty but is also held incapable of bringing action in respect of any contract made in that province. Concerning the manner in which these penalties operate we cannot do better than to quote Mr. Wegenast:—

"If the Acts were confined to the imposition of a tax or license fee and the general regulation of corporate activity, and if their requirements were enforced by penalties administered under a reasonable procedure, the effect might not be unduly oppressive, whatever might be thought of the wisdom and constitutionality of the legislation. But to the pecuniary penalties there is in most of the Acts added a provision denying to companies not duly authorized under the Acts the capacity to appear in the courts for the enforcement of corporate rights. A company which has not been alert to inform itself of the precise operation of the Acts may, therefore find itself deprived of an essential element of its corporate capacity. Thus a British company or a company from another province which has for years been carrying on business in Ontario through occasional commercial travellers or by correspondence may by the mere fact of appointing some person resident in the province to act as its representative, deprive itself of the right of suing in the courts of Ontario upon its business contracts or claims;—in other words it becomes, so far as business relations in the province are concerned, an outlaw. In the province of British Columbia the position is rendered still more serious by the fact that business through non-resident travellers or by correspondence is not excepted, so that even an isolated business transaction by a foreign company which has no representative or branch in the province is fraught with the risk of legal incapacity on the part of the company to enforce its rights. And this disability can be overcome only by compliance with very onerous formalities and the establishment of a head office in the province and the appointment of a resident attorney with extensive powers."

To the lay mind it is monstrous to think that a company under any circumstances should be unable to enforce its rights by legal action. How much more is this so when applied to a concern which has duly received its charter from the Dominion Government?

For the present there is no other course open to those concerned than to see to it that their business is adjusted to meet the requirements of the various provincial enactments. The only alternative to this appears to be to run the risk of a law suit in which there would be no chance of success without going to the Supreme Court and perhaps the Privy Council on the constitutional aspects of the case.

The constitutional point at issue is whether or not the provinces have in these Acts exceeded their powers under the British North America Act. The whole question is bristling with complications both on the legal and the practical side and presents one of the most serious constitutional issues that have come before the courts since confederation. The situation is such that an early decision of the issue in one way or another is in the highest degree desirable. Until such a decision is obtained there is no choice but to learn as much as possible about the provisions of the various provincial acts and comply carefully with their requirements. Herein the Canadian Manufacturers Association's publication will be of the greatest possible assistance to the commercial interests of the Dominion. The explanatory passages throughout are particularly lucid, and despite the ticklish nature of the subject discussed there is not enough legal phraseology in any portion of the text to make a thorough understanding thereof in the least difficult to the lay mind.

Lumber Prices in Canada and the United States

A special report which will be of much interest and value to the producers of natural products in Canada has been issued by the Department of Labor in the form of a 316 page volume giving comparative market prices for agricultural, fisheries and mine products in Canada and the United States during the past five and a half years.

On account of the practical absence of any uniform system of grading in the lumber trades of Canada and the United States the accuracy of such a report upon the lumber prices must not be taken as unfailingly complete. It may be taken for granted, however, that in preparing the report the government and all those who assisted kept this feature of the situation carefully in view and did their best to provide reports which could be properly made the basis of a useful series of comparisons.

In its introduction to the report upon the course of prices in the lumber trade of Canada and the United States the report takes up this feature at some length, as follows:

To obtain statistics of lumber prices on a basis admitting of direct comparisons between Canada and the United States offers peculiar difficulties. These difficulties arise chiefly from two sources, (1) the absence of any uniform system of grading lumber in either country; and (2) the general conditions prevailing in the trade between the two countries. Brief references to each of these features may be made in turn:

(1) Absence of uniform system of grading.—Notwithstanding repeated attempts to establish systems of grading on both sides of the international boundary, the trade is for practical purposes without recognized standards of quality. Especially is this true of pine, which constitutes a most important part of the Canadian export trade with the United States. This is largely the result of the varyind conditions which determine quality in lumber. Localities often within short distances of each other produce standing timber of different characteristics. Again, one tree in the same locality differs from another; log from the same tree differs from log; board from the same log differs from board. In a rough way the nature of the output of the different mills is known to the trade; but it remains true that almost every transaction between the mills and the wholesaler, and between the wholesale and retail trade, is highly individualized, and that the definition of grades becomes in the final resort a matter largely of personal judgment. Almost every millman and dealer has his own method of sorting and classifying boards, and even where the same terminology is employed, the quotations may be for widely different articles. Further, such distinctions as the following occur frequently: at Buffalo, boards designed for local consumption will be found to be quoted in certain instances at different prices from the same boards in the same yards when resorted for shipment to outside points. Printed records of lumber prices are accordingly somewhat rare, and where they exist are offered chiefly as approximations within considerable ranges requiring an amount of interpretation that renders direct comparisons hazardous.

(2) Features of trade in lumber between Canada and the United States.—It follows from the above that in an inquiry into comparative lumber prices reliance must be had chiefly on the opinion of those in business on both sides of the boundary. The consensus of opinion among several millmen and wholesalers in Canada and the United States was that the course of the lumber trade is at present affected but slightly by international considerations. The chief mar-

kets of the lumbermen of Ontario and Eastern Canada are three in number: the home market; the United States market; and the British market. The influence of these markets on current prices varies in different sections of the country. In the same section, moreover, at different times the flow into the markets in question fluctuates according to conditions therein of supply and demand. It frequently happens that most of the output from a particular section will go in one season to a particular market, while in the following season the main current may be in quite another direction. As a generalization, the United States offers a steady demand for the better grades of Canadian soft lumber, though the poorer qualities also find a market, more or less restricted and variable in character, south of the international boundary. The area within which Canadian lumber can be successfully marketed in the United States is largely determined by freight rates relatively to the situation of areas producing similar or interchangeable grades in the United States themselves. Georgian Bay pine, for example, can meet the pine of Wisconsin and Minnesota (which is generally of better quality) in the Buffalo market, but finds the pressure of competition increasingly powerful in markets further west. The products of the Quebec limits meet those of Georgia and the other southern States in the eastern cities of the United States. On the other hand, some southern pine finds its way north to Ottawa, turpentine, in the case of southern forests, yielding a return almost as valuable as the lumber. In all cases, of course, the special qualities of the products create a market for themselves. In the hardwoods, for example, most of the oak consumed in Ontario is received from the United States, owing to the superiority of the southern oak over that produced in many parts of Ontario. On the other hand, Ontario birch flows south, being generally superior in quality to that produced south of the line. In the west a considerable amount of low-grade lumber is shipped from Minnesota and Wisconsin to the Northwest Provinces, but the keen demand for the higher grades of pine in the United States keeps most of these qualities at home. Northern Ontario and British Columbia meet most of the demand in the Northwest Provinces, British Columbia being able to compete successfully with Washington and Oregon owing to lower stumpage rates and the less costly methods of logging which in many sections are possible.

In view of the above, it was the consensus that, quality for quality, and other things being equal, distance from the mills is the chief factor in determining prices of lumber in Canada and the United States. In most cases prices are higher in the United States than in Canada, seeing that the chief movement in lumber is from Canada to the United States. In a few cases, however, the opposite is true, and oak is ordinarily higher in Toronto than in Buffalo, though birch is higher in Buffalo than in Toronto. An example typical of many others is as follows : At Liverpool, N.S., surfaced hemlock boards (planed on one side) were quoted during June, 1911, at $12.25 per M., f.o.b. These landed in the Boston market would stand as follows:—

Cost f.o.b. Liverpool	$12 25
Freight	3 00
Duty	1 25
Commission (5 p.c.)	0 90
Interest	0 40
Insurance	0 45
Total	$18 25

In Boston at the same date this lumber was selling at $18.50 to $19.00 in competition chiefly with Pennsylvania hemlock which is generally somewhat inferior in toughness to the Nova Scotia product.

The tables of prices are given, not as affording direct means of comparison—though grades as nearly as possible corresponding to each other have been selected—but as of interest, subject to the interpretation which the trade will be able to give them, as showing the general tendency of lumber prices in the two countries during the past few years.

The Tariff Situation—Some of the Results

The most noticeable result of the defeat of the reciprocity proposal at the recent Dominion elections, so far as the lumber and paper making industries of Canada are concerned, is the fact, already apparent, that United States paper manufacturers are looking definitely to Canadian forests for the raw material for their paper mills. It has been freely predicted and speciously denied that this would be the case, but the test of the pudding is in the eating thereof, and it is to be noticed that the paper manufacturers of the United States are already coming forward for a share of the Canadian raw materials. If reciprocity had been passed, possibly the same results would soon have occurred on account of the irresistable force of natural and economic laws. But now that all uncertainty about the action of Canada has been removed, the United States manufacturers will be quicker to realize that for the perpetuation of their business they must have Canadian pulpwood. To have it they must now build their mills in Canada and manufacture the pulpwood into wood pulp or paper in Canada. The newspapers of the United States and Canada are now printing almost daily reports of the decision of additional United States manufacturers to follow this course. One of the most noticeable is the case of the Bayless Company of Austin, Pa., whose dam recently broke causing a great loss of life and property and destroying the company's mill. This company had already secured pulpwood areas in Canada and they will now, it is reported, build a mill in Quebec and manufacture paper there. Another instance is that of the Berlin mills, of Berlin, New Hampshire, which are arranging to build paper mills at Three Rivers, Que.

An interesting side light upon the situation is afforded by the recent act put into force by the Province of New Brunswick to prevent the export of pulpwood from that province in an unmanufactured state. This act will not be of real effect for another year to come, as it refers to licenses which have been renewed or transferred after the act came into force. The date for the renewal of most of these licenses is August 1st, and as the act came into force on October 1st, these licenses will not be effected until next August. In the meanwhile it will be possible to export pulpwood from lands held under such licenses.

Another feature of the situation which is of much interest is that which has to do with the Pike Law in the State of Maine. By means of this law, logs which were cut in the State of Maine and manufactured into lumber in New Brunswick could be exported into the United States free of duty. This act has recently been abrogated and such lumber will be subject to the same duty as all other lumber coming from Canada. If the reciprocity measure had carried and all rough lumber from Canada had been admitted into the United States free of duty, the manufacturers of lumber at St. John who use logs from the State of Maine would not have been effected by the abrogation of the Pike law. It now remains to be seen whether the reported threat of these manufacturers to greatly reduce the amount of their cut will be put into practice.

Still another feature of the situation which will be watched with keen interest in Canada is the possibility that the United States Congress may of its own motion remove the duty on rough lumber. If this were done, and there are those who profess to believe that it is quite probable, Canadian lumber manufacturers would be in possession of the advantages which they would have secured under reciprocity, and the country as a whole would have lost nothing. When the reciprocity measure was before the House of Representatives at Washington there was a strong movement on foot in favor of what was known as "the farmer's free list," which included lumber. The sponsors of this movement are reported to be determined to make a fight for it again when congress meets. Canadian lumber manufacturers, however, would be foolish to wait for any such doubtful movement to have effect. They should immediately go to Ottawa with a demand for a duty on rough lumber.

Hemlock Manufacturers Hold Meeting

Grading and Inspection Problems Discussed—Proposed Co-operation with Canadian Lumbermen's Association—Next Meeting in November

A meeting of the hemlock manufacturers of Ontario was held at the Queen's Hotel, on Monday afternoon, October 9, at which the principal subject of discussion was the proposed formation of an association, and the drawing up of rules for the grading of hemlock lumber. Mr. Norman Hocken, Otter Lake Station, Ont., presided, and Mr. W. J. MacBeth, Toronto, acted as secretary. Those present included Herman Weismiller, Bala; W. W. Carter, Fesserton; J. A. Detweiler, Longford; Chas. McGibbon, Penetanguishene; J. K. Muir, of Muir, & Terry, Toronto; J. P. Johnson, of Campbell & Johnson, Toronto; Frank Hawkins, secretary of the Canadian Lumbermen's Association, Ottawa; A. C. Manbert, of Graves, Bigwood & Co., Toronto; R. B. Elgie, of Elgie & Jarvis, Toronto; John Donogh, Toronto; W. J. Lovering, Toronto; J. G. Cane, Toronto; A. D. Gordon, of R. Laidlaw Lumber Co., Toronto; A. E. Eckardt, of R. Laidlaw Lumber Co.; Robt. Lee, of J. D. Shier Lumber Co., Bracebridge; T. S. Parkinson, Huntsville, and James Lauder, Toronto.

Mr. Hocken in opening the meeting referred to the previous meeting at which it had been decided that the questions of forming an association, and adopting definite grading rules for hemlock should be taken up, at a meeting to be held early in October. He then asked the members present to report upon the stock which they had on hand, and the amount which they had cut during the year.

In summing up after hearing the reports, Mr. Hocken said it seemed that the quantity of hemlock in the country was no greater than at the time of the last meeting, possibly somewhat less. Judging from the reports he thought that the market was holding its own.

Mr. A. P. Johnson introduced a discussion upon the advisability of averaging up the prices on the various lengths of hemlock. He found it a difficult matter to persuade the trade to pay different prices for the different lengths, and he thought it was a question whether it would not be better to make an average price all round, and have some arrangement whereby only a certain percentage of the desirable lengths, such as 16 feet, and up, would be included in a shipment.

The upshot of the discussion was a general belief that there was no good reason for advancing prices at present, and that conditions in regard to prices for the various lengths should be left as they are.

Mr. MacBeth then introduced a discussion upon the duty upon lumber. He claimed that lumber was about the only manufactured article in Canada, to-day, which was not protected. The only way in which they could secure fair treatment in this direction would be by making themselves a national institution with local organizations. Every lumberman should belong to the national organization—the Canadian Lumbermen's Association—and let a certain amount of the fees paid into that association be handed back to the local organization. Only in such a manner would they be able to give their opinions and requests sufficient force to have them respected.

The matter of adopting standard grading rules for hemlock was also brought up by Mr. MacBeth who suggested that representatives of the manufacturer, the wholesaler, and the retailer should be formed into a committee of at least 5 members, who would draw up grading rules. These rules should be such, that whenever anybody made objection to a shipment, a decision should be given by a disinterested party appointed by the association.

Mr. Manbert asked what were the results of the efforts that had been made in the United States among the hardwood people to standardize their grades

Mr. MacBeth replied that nearly all hardwood lumber was bought and sold on the National Hardwood Lumber Association rules, and subject to their inspection. During the month of September last, these inspectors had passed judgment upon 11,000,000 feet of hardwood in the United States. There were some 8 or 9 salaried inspectors, and some 6 or 7 who were inspecting on a percentage basis. This went to show that even in these dull times the inspection of the association was largely used.

The discussion then reverted to the proposal that an association should be formed. After some consideration of this question the chairman called upon Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association to address the meeting.

Mr. Hawkins commenced by stating that there seemed to be an impression among the members present that the Canadian Lumbermen's Association was a pine association. It was not a pine association, or a spruce association, or a hemlock association. It was a lumbermen's association. Any manufacturer, wholesaler or exporter of lumber was entitled to membership. The association would be very glad to welcome any hemlock manufacturer as a member. A remark had been made by Mr. McGibbon about the advisability of having inspectors appointed by the government. Mr. Hawkins stated that this point had been brought before the deputy minister of trade and commerce about 18 months ago and the deputy minister had stated that the government would not under any circumstances consider the appointing of lumber inspectors. Of course this had been before the recent change of government. As to the grading and inspection of lumber there had been a great deal of discussion of late upon the question and the Canadian Lumbermen's Association had gathered a lot of information from the various associations in the United States about their rules and regulations. At the next annual meeting of the association in February he believed that the question would come up. He outlined the system as it exists in the United States and explained that the Canadian Lumbermen's Association from the first had been ready to appoint arbitrators to settle any disputes between members as to shipments. During the whole course of their existence however, they had not been called upon to appoint a single arbitrator.

Mr. Hawkins said that he had gone through the mill in the formation of the association and the Canadian Lumbermen's Association had now a strong representation from all parts of the country which was ready at any moment to take up any question in which the lumbermen were interested. They had already taken up a number of important questions and had been of great benefit to the lumber industry. Among the questions which had been handled was that of insurance, and the association with the assistance of other associations had been able to preserve for the lumbermen the right to insure in the mutual insurance companies of the United States which gave much lower rates than the old line companies. Other very important problems which had been handled by the association to the advantage of the industry were those regarding freight rates on lumber, allowance for car stakes provided by the lumbermen, allowance for absorption of moisture, ice and snow, etc. in the weight of a car, the theft of logs on the Pacific coast by poachers who at present were immune under the law, the uniform bill of lading, etc. Recently the association had organized a trade report bureau which was already proving of great value to its members and which if properly utilized by a large number of the trade would result in assisting not only those who were called upon to give credit but those who sometimes found themselves in financial difficulties. In the United States a number of firms had been saved from bankruptcy by the timely assistance of the trade report system as it had been possible to arrange the troubles of the men who were in difficulty before the crisis actually arrived.

The collection of debts was also one of the matters which the association had under consideration and they also hoped to secure more of the work of collecting claims from the railways for overcharges.

In conclusion Mr. Hawkins said he did not wish to say that the hemlock men would not accomplish great things if they formed an association, but he assured them that they would not accomplish much unless they had a much larger membership than was represented at this meeting.

The members listened with great interest to Mr. Hawkins' remarks and benefitted greatly by the suggestions which he made.

A discussion then developed as to the manner in which any system of grading and inspection could be enforced if it were adopted. Several of the members were at some variance about the details of such a proposition but there was a general consensus of opinion that any grading and inspection system would require the backing either of the government or of some important body such as the Canadian Lumbermen's Association if it were to be effective.

A resolution was finally adopted that the secretary should write to the secretary of the Canadian Lumbermen's Association suggesting that he invite the Hemlock manufacturers to become members of the Canadian Lumbermen's Association. The purpose of this motion was to provide for the members a satisfactory means of taking up afterwards, the questions of grading and inspection.

It was also agreed that the next meeting of the hemlock manufacturers should be held about the middle of November and that some of the larger manufacturers should be asked to come to that meeting with their proposals for grading hemlock definitely prepared, to be submitted at the meeting. It was felt that in this way some definite step would be possible in the direction of adopting rules.

Progressive Lumbering at Fassett, Que.

Up-to-date Plant and Shipping Facilities Which Enable the Fassett Lumber Company to Maintain a Leading Place in the Industry

Fassett Lumber Co.—General View of Saw Mill

Among the numerous saw mills of Quebec Province none have a better reputation for quality of output, splendid and up-to-date operating facilities and businesslike management than the Fassett Lumber Company of Fassett, Quebec, under their efficient manager, Mr. J. R. Collins.

Ideally located on the main line of the C. P. R. from Ottawa to Montreal and practically on the bank of the Ottawa river, they possess excellent shipping facilities by both rail and water. The shortage of logs experienced by the lumbermen further up the Ottawa river this season did not affect the Fassett Lumber Company. From their limits over 14 miles up the country, their own railroad runs direct to the mill, conveying the logs from limit to log pond in a few hours. During the past year this roadbed has been extended several miles. One of the accompanying illustrations shows the method of loading logs at the limits, preparatory to conveying them to the mill.

The railroad equipment consists of three Shay-geared locomotives, one of 55 tons, one of 65 tons and one of 70 tons, besides one saddle tank switching engine of 25 tons, two Barnhart steam loaders, 45 logging cars and 26 flat cars.

The company claim with confidence that they are able to turn out lumber cheaper than any other company in Eastern Canada. An inspection of the plant will convince one that in making this claim the company have good reason to believe that they can back it up conclusively. The mill is equipped with the most up-to-date machinery, and labor-saving devices known to the lumber industry. The equipment includes two Clark Bros. eight-foot single bands complete with steel carriages and steel niggers; one Clark automatic overhead trimmer, to trim from six to twenty-four feet; one heavy double edger and one overhead slab slasher with five saws. Attached to the saw mill is a planing mill and shingle mill equipped with the latest type of machinery.

The equipment in the engine room includes a 450 h.p. Clark engine which supplies the power for the saw mill and a Westinghouse 600-volt generator which supplies light for the mill and town and power for the planing and shingle mills. In the engine room is also located one of the latest model fire pumps which is connected with the mill pond by a twelve-inch pipe. The pump has a capacity of 1,000 gallons per minute. On every floor, and at places within easy reach, coils of hose are placed and throughout the lumber yard a system of hydrants has been installed which can be turned on at a moment's notice in case an outbreak of fire should be discovered.

The sorting and grading table in the saw mill is 350 feet long and is equipped with live rollers running the full length of the table. The yard is fitted up with eight railroad docks and has a capacity of 15,000,000 feet which is constantly being enlarged. The shipping facilities are excellent, switches being laid between each row of lumber piles for standard gauge cars, by means of which lumber can be loaded on cars without any haulage. It is a remarkable fact that around the mill the company have no need for horses, their perfect rail system doing all the work.

All kinds of pine, spruce, hemlock and different kinds of hardwoods are manufactured and the company specialize in long timber, cutting lengths up to 40 feet. With their own railway system they are able to convey the timber to the mill at any time of the year for special orders.

The fiscal year of the company ended on September 30th, and proved to have been the most successful year in the history of the concern, the stockholders receiving a dividend of 10 per cent.

During the coming season the woods operations will be greatly extended and over 25,000,000 feet will be cut in 1912. To do this, a double tower is run, night and day, and with the hot pond in connection, the mill runs all winter without any shut down. The logs being taken from the limits for next season's cut, as seen by the representative of the Canada Lumberman, are a splendid run, and the company promise to have a specially fine cut of hardwood for next year's market.

The officers of the Fassett Lumber Company have long been connected with the lumber business. The president is Hon. J. Sloat Fassett, vice-president of the Second National Bank, Elmira, N. Y., who has long been identified with lumbering interests in the United States. The vice-president is Mr. A. E. Edgecombe, Knoxville, Pa., and the secretary-treasurer, Mr. Harry S. Thayer, Elmira, N. Y. Mr. John R. Collins, the efficient manager of the business at Fassett, is a native of Pennsylvania who has had a lifelong experience in the lumber business and much of the success of the Fassett Lumber Company is due to his splendid management.

Fassett Lumber Co.—Loading Logs on Cars for the Mill

The Meaford Manufacturing Company are contemplating the erection of a sawmill in the town of Meaford, with a capacity of 15,000 feet of hardwood per day.

Trade Conditions Throughout Canada

Reduction Probable in Woods Operations During Coming Winter— Opinions of the Trade Upon the Season's Business and the Outlook

The outlook for the lumber trade of Canada at present is undoubtedly encouraging. Reports which have been received by the Canada Lumberman from many parts of the country indicate this beyond any question. In many parts of the country the report is that trade is good. From other parts which have been affected more than others by the depression in the United States and by the reciprocity campaign, reports come that business has been dull but that stocks have been moving off steadily. In the Georgian Bay district of Ontario, especially along the North Shore, this is particularly the case. Reports from that part of the country indicate that although no immediate boom in the lumber business can be counted upon there is no reason for expecting a serious decline in trade. Most of the manufacturers in that district however are adopting conservative methods in their operations and will reduce the amount of their cut in the woods during the coming winter.

Regarding the situation in the Georgian Bay district the opinion of a well posted operator is as follows:—From conversation with other lumbermen we do not think that the woods operation on the whole will be as large as usual, there being a feeling of conservation throughout the trade. We do not look for a settled condition of business until after the elections in the States next fall, 1912. There is no doubt that there are a great many economical questions to be settled on the other side of the line and the most optimistic persons would not dare to venture an opinion as to what the result is going to be. We have great faith in the lumber business, but are decidedly hampered with the present conditions. Still we believe that the future has many good things in store for us.

A reduced cut is also indicated by the reports which have been received from Nova Scotia. In New Brunswick the season has been spoiled considerably by the lack of sufficient water in the rivers for driving operations. The high cost of freight to the old country has also been a serious drag. The indications therefore are that in this province also there will be a reduced cut. In British Columbia conditions have been rather uncertain and still continue so. The volume of business this year however, has been greater than in any previous year. The crop uncertainties and the competition of United States lumber however caused a good deal of unprofitable business.

Taking it all round it appears that the country has passed through a season of much uncertainty in rather a conservative manner and has entered the fall season in a much better condition than might have been expected. With the political atmosphere in Canada cleared, it is reasonable to expect that business will revive and that with careful woods operations and a somewhat reduced cut in most parts of the country, there will be a feeling next spring of trade buoyancy such as has not prevailed for some years past.

Following are some of the letters which have been received by the Canada Lumberman upon the subject:—

Lighter Cut Expected on Georgian Bay

The Wolverine Cedar and Lumber Company, Sault Ste. Marie, Mich., and Little Current, Ont.—In our vicinity stocks on hand are a little lighter than they were at this time last year, possibly 10 or 15 per cent., but we cannot tell how much importance can be attached to this. Last year shipping as a general thing was very poor in August and the first part of September and became much more active the last six or eight weeks of navigation. This year shipping seems to have been fairly good in August and September, but unless it keeps up, stocks may be heavier at the close of navigation than they were last year. Our own stock on hand Sept. 15th was about ten million feet as against fourteen million feet at the same time last year, but we had more than usual on hand last year and less than usual this year.

The log cut on the North Shore the coming season will, in our opinion, be somewhat less than it was last year. Most operators are curtailing somewhat and one we know of is not operating at all. On the other hand, we know of one new concern which will operate this year to the extent of probably ten million feet, and one or two others who will increase their cut somewhat. Our own cut will be not far from what it was last year.

Prices just now seem to be substantially what they were last year, but sales we think are even slower, and we cannot see any upward tendency in prices, except possibly in Norway, which went off last fall and spring but has now come up a little bit, being higher than it has been since about Sept. 1, 1910, and substantially on a parity with the early summer of 1910. Wholesalers claim to be selling white pine for about a dollar less than they did a year ago. Before the season is over this is likely to be reflected in the prices paid in any further purchases this fall.

About the only special feature we have noticed in the trade this season has been the expectation of reciprocity and consequent removal of the United States import duty on lumber, which we think has had some stimulating effect on purchases made this summer for late fall and early spring shipments. With this stimulus removed we believe that trade is likely to quiet down a little. In fact we cannot see any features of particular encouragement in the outlook for next year. By far the greater part of Georgian Bay lumber is imported into the United States and general business in the United States is not undergoing any improvement. Some large lines being even duller than any time in the last two years. The Presidential nominations and election next year are likely to put a further damper on business there.

The writer has heard some Canadian manufacturers say that the new Government is likely to put an import duty on American lumber, which would help Canada, but we cannot see where this would be of any particular assistance to the Canadian manufacturers except possibly those who manufacture hardwoods. If Canada imported more pine than she exported, an import duty would of course help, but Canada is certain to have an exportable surplus of lumber, and if an import duty shonld prevent some American lumber from competing in Canada, there would be a greater amount to compete in the United States markets with the Canadian lumber which was exported there. Furthermore, it seems to us possible that if Canada should place any further duties on American goods it might re-open the entire question in Congress and possibly result in the application of the surtax of 25 per cent. ad valorem.

Hardwood Trade Satisfactory on Georgian Bay

Keenan Bros., Limited, Owen Sound, Ont.—The trade in hardwood lumber is in first-class condition. The quantity and stocks on hand in our territory are, we believe, less than usual, although probably not less than at the same period last year. Heavy sizes are becoming very scarce. We think the general intention around this part is to cut the usual quantity during the coming winter, although we have in mind the fact that in every presidential year in the United States there is slackening of the lumber industry there, and our past experience has proven to us that a considerable quantity of it comes into Canada during that period to the detriment of our prices. As next year is presidential year, it is well worth keeping in mind, as a heavy stock here might be undesirable.

Prices have, if anything, been higher than last year, especially in thick stocks. The demaid has been excellent and we know of no reason why the prospects next season should not be good.

We have had the pleasure of receiving the Hoo-Hoo organization lately, and we believe that the trip which the members have taken on the Great Lakes bounding our country, will give them a better idea of Canadian resources than the most of them ever had before.

No Boom Expected for Some Time

Eddy Bros. & Company, Limited, Blind River, Ont.—The conditions of the lumber business at present are not very bright. Some of the mills on this shore will shut down earlier than usual on account of lack of dock room. Owing to the fact that this company is so closely associated with Mershon, Eddy, Parker Company, of Saginaw, Mich., however, we will have plenty of dock room this fall as that firm handle our entire cut for the season. In our own town here the Georgian Bay Lumber Company, Sheppard & Wallace, and the Midland Lumber Company, have stopped operating, and we understand the other firms along the shore are not going in as heavily this year as last. We have to depend entirely on the market in the United States for the lumber from this shore. The election here this year has kept the buyers back and as you know the presidential election on the other side next year will keep trade kind of dull. We do not now look for any boom in the lumber business for some time.

Trade Quiet But Steady

The Hope Lumber Company, Blind River, Ont.—Our mill has a full stock and is running day and night. We shall put in stock enough to supply our mill this coming season. No special market conditions are to be noted at this time, excepting that there is not a great deal of life to the trade, but we think the usual volume of lumber is being sold.

Smaller Cut Expected on Georgian Bay

The Sheppard Lumber Company, Waubaushene, Ont.—In regard to stocks on hand at present time, we think they are somewhat lighter than they were at this time last season. As far as we can learn, the cut in the woods during the coming season is going to be less, several firms are taking out nothing at all. We find prices to be about the same as last year, excepting norway, which has advanced considerably. The demand during 1911 has been good all season and has every prospect of remaining so for the balance of the season. The most noticeable feature with us has been the increased demand for mill culls. This class of stock is advancing in price and it apparently will not be long until box lumber, which has been slow for some little time, will again be called into use.

Logging Operations Reduced One-half

The Bruce Mines Saw Mill Company:—The stocks of lumber in this district are larger than we have ever seen them. Most of these stocks are sold in American ports, and everybody was waiting to see what was going to be done about the tariff. They have found out definitely now, but at present writing still have the problem of where to sell their stock at a decent profit. Prices have been so low all year in both pine and hemlock that the manufacturer's profit has been very small. Hemlock seems to be advancing the last few weeks and we think stocks are pretty well picked up.

We cannot see any prospect of improvement in white pine until spring. Logging operations during the coming winter will be probably about fifty per cent. of what they were last year in this vicinity.

Good Prospects at Owen Sound, Ont.

The Edward Hines Lumber Company, Owen Sound, Ont.—The regular trade in this part of the country is very fair. There is considerable building going on both in the town and country. The stocks on hand at the present time are about the same as a year ago, and the cut in the woods from the concerns in this district will be about the same as last year.

The prices of white pine are about the same, or maybe a little lower than in 1910. The norway prices have increased somewhat owing to the increased demand. We have quite an amount sold on order that is not in shipping condition at the present time, and the prospects for the balance of the season look very good.

Healthy Trade Conditions at Ottawa

The Shepard & Morse Lumber Company, Ottawa, Ont.—Trade conditions in this district are in a fairly healthy condition. The stocks in the different yards are somewhat smaller now than they were this time a year ago, and would have been materially further reduced had it not been for the strike in England.

Most of the lumbermen will take out about the same quantity of logs this coming winter, with the exception of one very large operator in the Ottawa Valley, who expects to reduce his output by one-third. This, however, will not affect the quantity of lumber to be sawn for next season, as this particular manufacturer has enough logs in the river to keep his mills running full capacity next season, notwithstanding the curtailment in the bush this coming winter.

Prices in the box and mill cull grades are slightly easier than they were this time last year. As a consequence this lumber is moving rather more freely, partly for local consumption, but the greater portion of it finds its way into the United States market.

The export trade is rather quiet at the present time, and we do not look for anything startling in the American market for the coming year.

Prosperity Ahead and a Good Demand

Bartram Brothers, Limited, Ottawa, Ont.—We have nothing to complain of in regard to volume of business. Our sales up to the present time have largely exceeded our total sales of last year. The amount of lumber on hand at the various points in this district is much below what it was at this time last year. A noticeable feature is the general scarcity of low grade white pine. On account of this, the price of mill culls and box lumber is very firm, and a little in advance of last year's prices. The fall trade has every promise of being good, and we can see nothing ahead, in the future, but prosperity, and a good demand for lumber.

A Poor Season on the Miramichi

The J. B. Snowball Company, Limited, Chatham, N.B.—The timber trade on the Miramichi this year has passed through one of the worst seasons in the experience of the writer.

In March and April the prospects looked favorable for a good season, but prices commenced to drop at once, and as a result, shipping from this port has been very much reduced. The Miramichi Lumber Company, manufacturers of about twelve million feet, have not sold or shipped any of their this season's cut. The Lynch Lumber Company are in the same position, and will hold from eight to ten million feet. Messrs. D. Sullivan & Son, and Mr. John O'Brien, sawers of about three and a half million feet, have not sold anything, and have the whole season's cut piled up. W. A. Hickson has sold about one-third, and Messrs. Sinclair Bros., possibly a quarter, and the balance of their stock is piled on their wharf.

Driving conditions were very poor in the latter part of April and May, and as a result the logs did not come into the booms as early as usual, and sawing was delayed all over the river, mills being a month later than usual in starting. Some of the operators have large portions of their logs held up in the streams, principally Messrs. George Burchill & Sons, D. & J. Ritchie, and Sinclair Bros.

The labor conditions in the Liverpool-Manchester district in the month of August further demoralized the timber markets in Britain, and the increase in freight rates from 37s. 6d. on the Miramichi in June and July to 47s. 6d. the latter part of August, had the effect of stopping any market shipments that might then have been made. To-day it is almost impossible to secure tonnage unless 50s. or more would be paid.

So far, no move has been made for the woods in this section, or if any, on a very limited scale, but it is likely that all the mill owners will be again logging, but with the outlook for the future, it will probably be on a very limited scale. All the mill men here were looking forward anxiously to the adoption of reciprocity and are rather disappointed at the result.

Prospects Not Promising at Richibucto

R. O'Leary, Richibucto, N.B.—The stocks of lumber on hand here are about the same as at this time last year. The cut in the woods will probably be lighter. The prices this year were lower than last year, and prospects do not seem to be much brighter. Demand for hemlock during 1911 was fairly brisk, but spruce was not up to the ordinary. The lumber districts here are being fast depleted, and the lumber now cut is of very small dimension.

Reduced Cut Expected in Nova Scotia

The Campbell Lumber Company, Limited, Weymouth Bridge, N.S.—It is a little difficult to give you a complete list of stocks on hand at this time of year—our final accounts and all statements being carefully made up in December at the close of each year. However, we give you below an approximate idea of just how matters stand with us.

	Sept., 1911	Sept., 1910
Value of lumber	$7,500	$22,600
Lumber on hand, ft.	500,000	1,507,000
Logs on hand, ft	4,400,000	1,980,000
Value of logs	$44,000	$19,800

The cut in the woods this winter will not be as much as last year, 1910, when it was 5,000,000 ft. This year, 1911, it will amount to about 3,000,000 ft., this is on account of having so many logs on hand—as you see by above account.

Prices are about the same as last year as to South America lumber. A little better demand and prices exist for Cuban stock, while the United States markets have been even still worse than last year, both in demand and price, although the United States market seems now a little firmer. It is not so good with South America and Cuba, as it was at the first of this season. The demand as a whole has not been brisk right through. The special features to our estimation in the Argentine have been poor crops, especially in corn and maize—in United States the tariff, and political agitation seems to have had a bad effect there.

Drought Shortened Nova Scotia Cut

F. C. Whitman, Annapolis Royal, N. S.—In a general way South American business is dull and freight advance has curtailed shipments. Drought has shortened the summer cut and white pine is cleaned up principally on that account. Logs must await autumn rains. Cuba spruce boards are well cleaned up. West Indies Cuba demand is fairly active.

I cannot give you any idea of actual stocks on hand. Two South American cargoes taking over 2,000,000 feet are loading here now and two schooners about 700,000 feet are to load for Cubo. Suitable vessels for Cuba and Porta Rico trade have been difficult of charter and buyers are waiting cargoes sold but not yet shipped.

Business steady at Port Greville, N.S.

H. Elderkin & Company, Port Greville, N.S.—Stock in hand, there is none, and none this time last year. The cut in the woods will be about the same as last winter in this section. There was about three to four million feet. We look for about the same prices, averaging above $13 f.o.b. vessel our shipping port. We know of nothing special to affect prices. Our lumber mostly goes to English markets, some piling and scantling to American.

Good Trade in Cape Breton

Chappell Bros. & Company, Sydney, C. B.—The local lumber trade is good, and prices, especially of hemlock boards, have been maintained throughout the season, a little higher than last year.

There is not much lumbering done in Cape Bretton, and comparatively all is consumed locally, hence the fluctuations of the foreign market do not effect prices very much. There has been a little falling off in prices of framing material since early spring, when prices were higher than ever before. Stock to day is not heavy, but the dealers are bringing it in both by rail and water about as required, and prospects are favorable for a good fall trade.

The demand has been good owing to the great activity in building, chiefly in Sydney, and about the collieries. The lumbermen are planning on operations about as usual this fall, but at most, operations in this country are small.

Stocks on Hand in B. C. About Average

East Kootenay Lumber Co., Jaffray, B. C.—The stocks on hand to-day compared with the stocks on hand this time last year, are not any heavier. A good many of the lumber companies are now equipping outfits for summer logging so that the winter operations are becoming less every year.

The price of lumber maintained a fair average for the first two months of the year. Since then prices have declined owing to the American lumber being dumped into our western markets at very low prices. The volume of business this year was greater than any year previous to this. The prospects for the balance of the year are not indicative of any great improvement in conditions.

We have had a peculiar year. A late spring, problematic crop conditions during July, wet weather in August delaying the maturing of the crops and a general tendency among the buyers to curtail their purchases till the ultimate result of this year's grain crop was finally known. The general result of the crop will prove higher than an average crop, which result will be the means of securing a heavy immigration next spring to the Northwest and we look for a very large business to commence early next year. How long it will continue will depend on crop conditions and the development of the railway construction, all of which are problematic questions to deal with at the present time.

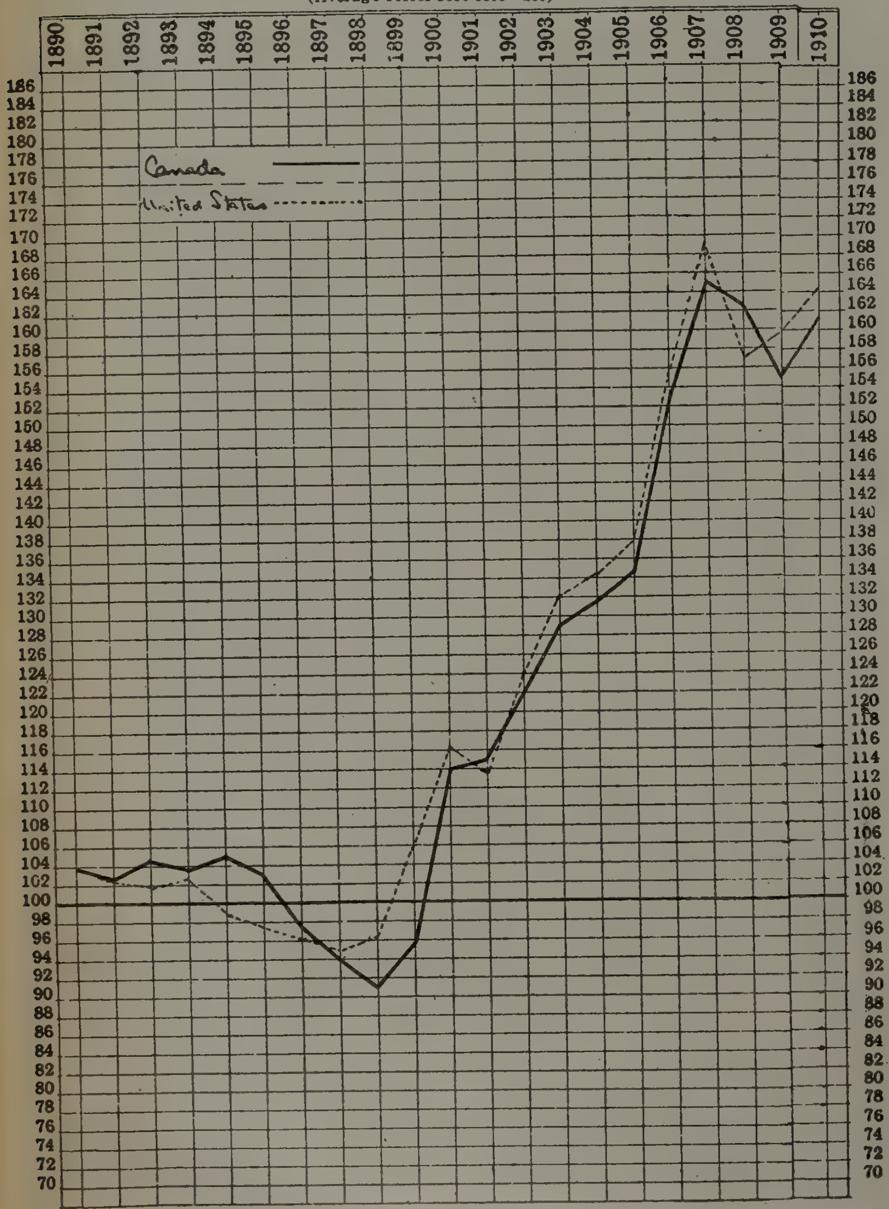
A few other interesting letters upon the trade situation have been received which were too late to be included in this issue. They will be published in the next issue.

Prices in Canada and United States

Interesting Comparisons of Fluctuations in Lumber Market During Twenty Year Period—Prices of Leading Grades

An interesting comparison of the prices of various classes of lumber products in Canada and the United States for the four years from 1908 to 1911 has been prepared by the Dominion Department of Labor. The most interesting feature of the comparison is the fact that the variation of prices in the two countries has followed largely identical lines. The following diagram illustrates this point:

(Average Prices 1890-1899=100)



The prices of spruce are given at St. John, Ottawa, Boston, and New York. At St. John the prices are shown for New Brunswick merchantable spruce deals, 3x7, 3x9, 3x11, and up, per M. superficial feet on the first market day of each month. The quotations were obtained from local dealers. Following are the St. John prices:

Prices of Spruce at St. John

Month.	1908.	1909.	1910.	1911.
	$ cts.	$ cts.	$ cts.	$ cts.
January	14.50	15.00	15.00	15.00
February	14.50	15.00	15.00	15.25
March	14.50	16.25	15.00	15.00
April	14.75	15.25	15.75	14.75
May	15.00	15.25	15.75	14.50
June	15.00	15.00	16.00	14.50
July	14.75	15.00	16.00	.....
August	14.75	15.25	15.75	.....
September	15.00	15.25	15.50	.....
October	15.00	15.25	14.50	.....

Tables showing prices of other varieties of lumber will be published in succeeding issues of The Canada Lumberman and Woodworker.

Personal News of Interest to Lumbermen

V. W. Tyler, representing the Manufacturers Lumber Company of New York, was in Fassett, Que., on Sept. 30th and spent the week end with J. R. Collins of the Fassett Lumber Company.

The Hon. J. Sloan Fassett, the well known lumber merchant of Elmira, New York, president of the Fassett Lumber Company, Fassett, Que., visited Fassett, Que., during the last week of September.

Mr. William Price, the former Conservative member for Quebec West, who was defeated by Mr. W. Power on September 21st, is reported to have decided to remain out of politics and to devote all his time to his numerous business interests

Mr. Frank G. Wurzburg, of Detroit, Mich., Canadian representative of the W. M. Ritter Lumber Company, Columbus, Ohio, was a welcome visitor at the office of the Canada Lumberman recently. The W. M. Ritter Lumber Company is one of the largest manufacturers of hardwoods in the United States. They enjoy an extensive business in Canada.

Messrs. Smith & Tyrer, Liverpool, Eng., have appointed as their special representative for Scotland, Mr. John Henderson, 11 Bothwell street, Glasgow. With an active representative on the spot they will be able to increase and develop their business in Scotland. They are similarly represented in London and on the Bristol Channel and at the principal centres on the Continent.

John Donogh, of John Donogh & Co., Toronto, has returned from a month's trip to Nova Scotia. He states that business there is active and the mills shipping steadily. Large consignments of spruce are being sent to the Argentine republic, trade with which is increasing. Many mills on the south shore, however, have been compelled to close on account of being unable to get their logs down, owing to low water, which may result in a curtailment of the output.

At the invitation of the Montreal Harbor Commissioners, members of the Board of Trade and other prominent business men inspected the harbor on Thursday, October 5th, being conveyed to various points by the new tug "Sir Hugh Allan." The lumber trade was well represented, among others by Mr. G. Scott, of the Argenteuil Lumber Company; Mr. W. Williamson, of the Laurentian Lumber Company; Mr. Arthur H. Campbell, of the Campbell-MacLaurin Lumber Company; Mr. W. T. Mason and Mr. P. D. Gordan, of Mason & Gordan; and Mr. W. T. MacLaurin, of the MacLaurin Lumber Company. The Commissioners entertained the visitors at luncheon.

Edward Hines, of Chicago, president of the Virginia & Rainy Lake Lumber Company, visited Fort Frances, in western Ontario, recently. He was accompanied by Edward Hines, jr., Mr. Grice, his attorney, and Mr. Cousins, of Virginia, the general manager. The party visited the proposed site for a saw mill, just above the Shevlin-Clarke mills. It is understood that Mr. Hines has asked Fort Frances authorities for a bonus of $25,000 as an aid to the purchase of the site, and a flat assessment of $25,000, the same as the Shevlin-Clarke Company has. In regard to the bonus, Fort Frances can not comply, as the site is outside the town limits, in the municipality of McIrvine, but the authorities of the latter city may come to satisfactory terms with the company.

WELCOME AS AN OLD FRIEND

The Canada Lumberman and Woodworker prides itself more than anything else on the large number of old subscribers. The following, from a subscriber of sixteen years' standing, is an example of many similar letters which are sent to us from time to time:—

Lakefield, Sept. 25th, 1911.

Hugh C. MacLean, Ltd.

Dear Sirs,—The accompanying cheque will pay for my subscription as per the within account. I have not been in the lumbering business for the past two years, but the "Lumberman" is always like an old friend, Welcome. I understand that I am one of your oldest subscribers.

Yours faithfully,
J. F. Lillicrap.

Death of James Davidson of Ottawa

The Late James Davidson, Ottawa

Ottawa, Oct. 8.—Controller James Davidson, probably the best known of Ottawa's public citizens, died at his apartments in the Hotel Cecil shortly before noon yesterday, after an illness lasting only two weeks. He was seized with an attack of acute indigestion on Saturday, Sept. 23.

Deceased was one of the best known lumbermen in the capital, and had business connections throughout Canada, the United States and Great Britain. He operated a large mill here for many years, having entered upon his career in the lumber trade when a boy. He served for many years as alderman in the City Council, was chosen mayor in 1901 to fill out the balance of the term of Mayor Morris when that official was disqualified, and on the establishment of the Board of Control he was elected to that body, being returned every year since.

The late Controller Davidson was for some years president of the Capital Lacrosse Club, and in this connection made many friends in Montreal, Toronto and other cities. His wife died several years ago, but two sons survive him. He was in his fifty-second year.

A private cablegram from Liverpool announces the death of David Jardine, of the shipping and lumber firm of Farnworth and Jardine, and a former New Brunswicker, at the age of 84. The firm at present control the Alex. Gibson Railway Company and lumber properties in New Brunswick.

Mr. Charles F. Smith, a director of the Laurentide Paper Company, died recently in Montreal, at the age of 71. He was one of the founders of the James McCready Company, now amalgamated with the Ames Holden Company.

B. C. Mills to Close Down till 1913

A press despatch dated Calgary, Oct. 9th, says:—Far-reaching changes were decided on at the conference held in Calgary over the week-end by the members of the Coast Mountain Lumbermen's Association. It was decided among the members that they should close down a large number of their mills this coming season and in some of the mountain mills not a wheel will turn until 1913. Horses are to be sold off, camp will be abandoned, and generally the lumbermen will mark time for about a year.

An important change which was agreed upon was that the lumber at present in stock in the various mills will be sold through one office, to be located in Calgary. Possibly the Mountain and Coast Associations will have separate offices, but there will not be more than two selling agencies at the outside. It is said that the dealers and mills are all pretty will stocked and the idea in selling through one office is that the mills will get cleaned out of their surplus lines. As the business has been conducted for the past year there has been some cutting in prices. If a mill had a large stock of one particular line on hand, it would tell its travellers to make a cut of $1 to $3 a thousand on this particular article.

Trade for the past year has been somewhat annoyed by the encroachment of the American mills. It was decided at the meeting Saturday that the association would meet all cuts that the Americans might make and put them out of business at all costs. In the meantime, an effort will be made to have the Government put a duty on American lumber that will give protection in the rough lines of lumber in which Canadians have to meet the keenest competition at present.

As a result of the placing of the lumber from one office alone there will be nearly 200 lumber travellers out of employment.

Appelton & Sewall Company, 156 Fifth avenue, New York City, have just secured a contract for the estimating and mapping of a large tract of timber land in Washington county, Maine. Maine timber land owners are beginning to realize the value of detailed and accurate information as regards their land. With topographic maps showing by fifty foot contours the elevation and other natural features, and with timber maps showing in colors the distribution of the timber, owners are able to economically handle their holdings.

Lumber, Timber, Lath and Shingles

Statistics of Production as Prepared by Forestry Branch Show an Output Valued at $83,989,197—British Columbia Making Rapid Increase

The following statistics of the lumber cut in Canada in 1910 are based upon reports made directly to the Forestry Branch of the Department of the Interior by 2763 firms operating nearly 3,000 sawmills. The reports are made on schedules furnished and cover the calendar year 1910.

As in the past, the co-operation of the secretaries of the different lumber manufacturer's associations has made possible the securing of lists of sawmill operators. This year, however, more careful and accurate work, based upon assistance given by trade papers, provincial and county and municipal officials, has enabled the Forestry Branch to give a better estimate of the actual lumber production than in any former bulletin. The total increase of 678 firms is chiefly due to the satisfactory and almost complete returns received from the small sawmill operators in Quebec. Ontario's number of reporting firms has decreased 84, owing to the shutting down of small operators, and to several important consolidations. In the West the number of mills has slightly increased, although the total cut has fallen off considerably, due to low water and other ungovernable causes, which have resulted either in the mills shutting down or running at much less than capacity cut.

This bulletin, including the lumber, square timber, lath and shingles produced in Canada during 1910, represents a total value of $83,989,197.

The products as reported for 1910 were as follows:

4,901,649,000 feet of lumber, worth $77,503,187.
37,962 tons of square timber exported, worth $985,255.
1,976,640,000 shingles, worth $3,557,211.
851,953,000 lath, worth $1,943,544.

Lumber Production of Canada

It will be borne in mind that where 1910 shows an increase over 1909 in the number of mills and the amount of lumber cut, this increase is in part due to the more complete reports secured in 1910.

For the whole of Canada there is an increase of 32.6 per cent. in the number of sawmill companies operating, there is a corresponding increase of 28.5 per cent. in the lumber output, or 1,086,707,000 board feet more than the cut reported for 1909. The average cut per mill reporting in 1908 was 2,376,000 feet; in 1909 it was 1,830,000 feet and in 1910 it was only 1,774,000 feet. This continual decrease in average mill output may be accounted for by the completeness of the reports received from small mills.

It is interesting to note that the increase in the lumber cut of Canada and the United States is about in proportion. This year, as before, the total cut in Canada for 1910 is a little less than one-ninth of the lumber cut of the United States for 1909, and a little less than the combined cut of the States of Washington and Maine for 1909. The per capita lumber production in Canada for 1910 was 653 board feet, or 170 feet more than the per capita lumber production of the United States for 1909.

Ontario, as in former years, holds its position as the first province in point of lumber production. Its forests are made up of diversified species which have enabled it to compete with other provinces in the production of every kind of lumber; but these limits are rapidly becoming consumed. Ontario has been Canada's greatest lumber producer for many years, although it is rapidly losing its supremacy. It still produces a little over one-third of the annual cut in Canada, but its percentage of increased cut per annum is decreasing. Ontario's 1909 cut was 17 per cent. greater than in 1908; it's 1910 cut was 7.5 per cent. greater than in 1909.

British Columbia Cut More Than Doubled

British Columbia will soon take Ontario's place and become the important timber province of Canada. This province, which in 1909 produced one-fifth of the total lumber cut, produced in 1910 one-third and lacked only 45,000,000 feet of surpassing the cut in Ontario. In 1908 Quebec was second in importance as a lumber province. Owing to a decrease in the cut in Quebec in 1909 and the rapid exploitation of the fir and cedar forests of British Columbia, the cut in the western province enabled it to usurp Quebec's position of second place. In 1910 this increase cut of fir, cedar, hemlock and spruce continued in British Columbia with the result that the 1909 cut was more than doubled in 1910.

Quebec increased its cut in 1910 by 23 per cent. over 1909, which is of interest considering the decrease in its 1909 cut from 1908. The 1910 increase, however, which was chiefly in spruce, was scarcely sufficient, owing to the great increase in British Columbia's cut, to maintain Quebec's 1909 percentage of 16.7 of the total Canadian production.

The statement that the small mills of Quebec have been reported better this year than in the past is proven by the fact that the average cut per mill in Quebec is less than half what it was in 1909. Consequently this province has the smallest annual cut per mill of any province in Canada—71,400 feet per year. British Columbia has an average annual cut per mill more than ten times as large—7,297,000 feet per year.

Due to an increased cut in spruce, New Brunswick had a 7 per cent. increase over the total cut in 1909. The next four provinces in importance, Nova Scotia, Saskatchewan, Alberta and Manitoba each had a decreased lumber production from 1909. Nova Scotia's cut decreased 4.6 per cent. while the western provinces decreased from 14 to 28 per cent. The western shortage of production is due to the bulk of water supply mentioned above. Alberta's cut did not fall off so much as Manitoba's, so that it moved up one place and stands seventh in importance among the provinces. The increase in Prince Edward Island, which nearly trebled the amount reported in 1909, is largely owing to more nearly perfect reports. In 1909 reports were received from this province for the first time.

Average Value of Lumber By Provinces

The value given for lumber is the value at the mill. The average in the several provinces and total average were as follows:

Canada	$15.81
Nova Scotia	12.66
New Brunswick	13.26
Prince Edward Island	13.48
Quebec	14.22
Alberta	14.28
Manitoba	14.33
Saskatchewan	14.38
British Columbia	15.32
Ontario	18.28

The average price of lumber in Canada for 1910 was sixty cents per thousand less than in 1909. The cost was lower in all the provinces except Nova Scotia and Prince Edward Island, which having comparatively small quantities did not effect the average price for Canada. The high average value in Ontario nearly $3.00 per thousand more than in any other province, is due to the large cut of white pine, which was over 50 per cent. of the provincial cut and was worth $20.83 per thousand.

The better quality of the lumber produced in Birtish Columbia as compared with the production of the prairie provinces may be seen by a comparison of prices. The average price at the mills of Alberta, Manitoba and Saskatchewan was $14.32 per thousand, the prices in these three provinces varying only ten cents per thousand. The price of lumber at the mills of British Columbia was exactly $1.00 more, or $15.32 per thousand. British Columbia lumber is shipped and sold in the prairie provinces along with the lumber produced at the seat of consumption, so that to give an accurate comparison of the prices which consumers are willing to pay for lumber from British Columbia and lumber grown right at hand, freight charges and cost of handling must be added to the cost of the western lumber.

Relative Production by Species

One of twenty-six native species of wood cut in 1910, the first nine in importance are coniferous or "soft" woods. Spruce is the most important lumber wood in Canada, constituting over one-quarter of the total cut. Spruce and white pine form hardly one-half of the 1910 cut, while in 1909 these two species made up nearly three-fifths of the total. This is due not to a decrease in cut but to a very great increase in the amount of Douglas fir, hemlock, cedar and yellow pine produced in British Columbia. One-quarter of the 1909 cut was formed by these four species, while in 1910 distribution on the former percentage they gained over 50 per cent.

White pine lumber is undergoing a gradual evolution in its importance to the lumber industry. Up to three years ago, white pine stood at the top of the list, when it was supplanted by spruce, although the actual cut of the former species had not decreased. The prediction of last year that white pine had nearly reached its maximum cut has proven true, for this year the 1909 cut was decreased by 4 per cent., namely 42,163,000 feet.

The increase of western species has been considerable. 47,000,000 and 51,000,000 more of Douglas fir and hemlock respectively were cut in 1910 than in 1909. Cedar, another wood cut largely in British Columbia, showed an increase of 114.8 per cent. or 217,430,000 over 1909, the largest actual increase shown by any species.

The cut of yellow pine, the most important lumber wood in the United States, increased nearly 600 per cent. in British Columbia during one year. This increase of 155,991,000 feet was sufficient to raise it from fourteenth to sixth place in importance. Thus it surpassed red pine, larch, balsam, and the four most important hardwoods. An increase of nearly 100,000,000 feet, or 140 per cent. in the larch cut was sufficient to give it eighth place over balsam which itself also increased over one-third.

Other woods showing increases larger than the average were birch, maple, jackpine, oak and walnut. Beech by an increase of 23.4 per cent. took fifteenth place from ash. Similarly oak usurped poplar's position. Hickory, owing to a falling off in Ontario's cut of 187,000 feet was the only other species besides white pine which did not have a total increased cut. Severel groves of walnut were cut last year which resulted in an increase of 435 per cent. over 1909. Six other species have been added to the list of native woods reported as cut in Canada. These are chestnut, butternut, cherry, tulip, sycamore and alder, together amounting to 771,000 feet.

Decreased Average Price of Lumber

The decrease of 60 cents per thousand in the average price of lumber in Canada during 1910, is mainly due to the lower price of spruce and white pine, which together form nearly one-half of the lumber output. The cost of spruce fell off $1.00 per thousand in 1910, the price being $14.55 in 1909. The price of Douglas fir in 1909 and 1910 was $21.55 and $20.41 or $1.14 less in 1910. The soft woods, particularly the western species, Douglas fir, cedar and hemlock, have increased in price. The price of hemlock, larch and jackpine increased slightly, and red pine prices remained the same. The hardwoods which were cut in any quantity also increased in price except birch, basswood, beech and poplar. The greatest decrease was with birch, the price of which fell off $1.49 per thousand. Hickory had the greatest increase in price of any species. The 1909 price was $26.47, and the 1910 price was $39.61 or $13.14 more. Walnut, a species of small importance to the lumber industry, had the greatest decrease in price of any species, the 1910 price being $8.58 less than in 1909.

There were two species of which Canada cut a larger amount in 1910 than the United States did in 1909—cedar and balsam. Nearly 60,000,000 feet more of cedar was cut in Canada in 1910 than in the United States in 1909. Similarly over 15,000,000 feet more of balsam was cut in Canada than in the United States. Comparing the Canadian figures for 1910 with the United States figures for 1909, the latest available, it is found that spruce is the only other timber in the output of which Canada nearly equals the United States. The cut of spruce for the United States in 1909 was 1,748,547,000 or 488,516,000 feet more than were cut in Canada in 1910. In other important timbers the cut in the United States was many times that in Canada, there being nearly four times more white pine, seven times more Douglas fir and hemlock, about ninety times more yellow pine, seventeen times more maple and nearly two hundred and fifty times more oak produced in the United States than in Canada.

Hardwood and Softwood Production Compared

Soft woods comprise 94.3 per cent. of the total lumber cut in Canada; hardwoods and most of them of the less valuable species, make up the remaining 5.7 per cent., which is exactly the same proportion as in 1909. In the United States during 1909 the softwoods contributed 76.2 per cent. of the total and hardwoods 23.8 per cent.

There were imported during 1910, railway ties and logs (nearly all hardwood) handle, heading, stave and shingle bolts and oak staves to a total value of $2,105,130. The total value of hardwoods imported into Canada during 1910, including hard pine (usually a substitute for Canadian hardwood) was $7,448,935, which is two and a quarter million dollars more than in 1909. The total value of the hardwood lumber produced in Canada in 1910 was $4,958,450—$952,930 more than in 1909.

The value of the hardwoods imported into Canada during 1910 exceeded by 50 per cent. the value of the hardwoods manufactured into lumber in Canada during 1910.

Nearly all these imports are from the United States for Canada is dependent on this country for the greater part of her supplies of such valuable hardwoods as oak, hickory, white wood (tulip or yellow poplar) chestnut, gum, walnut, cherry and all the hard pine which is so frequently used as a hardwood.

From these figures it is seen that we are becoming more and more dependent upon the United States whose available supply for export is surely and rapidly disappearing. It is evident that whatever can be done to improve the hardwood resources of Canada, particularly the small wood lots of Ontario, should be done with all possible speed.

Production of Spruce Lumber

Spruce:—Under this heading are included all the different species of spruce found in Canada. From Saskatchewan to the Atlantic, white spruce predominates with a small percentage of black spruce. In Alberta the cut is about evenly divided between white and European spruce. In British Columbia Engelman spruce predominates with a good percentage of tideland or Sitka spruce.

Mills to the number of 1652, or 60 per cent. of Canadian mills cut spruce, which is a greater number than for any other species. Over half of these are situated in Quebec and cut small amounts as do Ontario's mills, which although more numerous than in New Brunswick, Nova Scotia, and British Columbia do not cut as much spruce.

As previously, Quebec was the chief spruce producing province in 1910, producing nearly one-third of the total spruce in Canada. New Brunswick ranked second with approximately one-third of a billion feet, which was an increase of 75,134,000 feet over 1909, and the greatest increase in spruce of any province. Nova Scotia produced 7,318,000 more feet than in 1909, while Ontario cut a little over a million feet more. British Columbia cut 74,919,000 feet more in 1910 than in 1909, and more than doubled the percentage of the total spruce cut in Canada. Saskatchewan and Manitoba fell back some twelve and nine million feet each. Alberta, like the other western prairie provinces, had a decreased cut, and Prince Edward Island had a slight increase.

The report shows a very small range of prices. Throughout Canada, the price of spruce lumber decreased $1 during 1910. It was not expensive in Ontario at $14.92, and cheapest in Prince Edward Island, as in 1909, at $12.49.

The 1910 cut of spruce in Quebec exceeded the 1909 cut in Maine, the important spruce state of the United States, by 1,264,000 feet. The average price in Maine was $17.25 per thousand, as compared with $14.28 in Quebec for 1909; the average price in the United States was $16.91, or 35 cents more than in 1908, while the average price in Canada was $14.55—$2.36 less than in the United States.

Production of White Pine

White pine:—This includes the eastern white pine and the western white pine of British Columbia. White pine was cut by over a thousand mills throughout seven provinces in Canada during 1910, of which about equal proportions were in Ontario and Quebec. Notwithstanding this, more than ten times as much was cut by the former province—851,757,000 feet, or 85 per cent. of the total. Like Ontario, New Brunswick, Nova Scotia and British Columbia cut less white pine in 1910 than in 1909. The decrease of 36,173,000 feet, or 4 per cent. in Ontario, is partly counterbalanced by an increase of 18,755,000 feet, or 30 per cent. in Quebec, and a report from Manitoba, for the first time, of 2,459,000 feet. New Brunswick and Nova Scotia cut practically the same amount this year, having fallen off approximately 5,000,000 and 10,000,000 feet respectively. The amount cut this year in British Columbia was less by 12,244,000 feet, or 47 per cent. of the 1909 cut.

The average price of white pine in Canada decreased $1.14 in 1910, which makes it 33 cents per thousand more than in 1908. It was dearest where only a small quantity was cut, in Prince Edward Island at $26.02, and cheapest in Nova Scotia, as formerly, at $15.18. The cause of the Canadian decrease in the price of white pine is seen in Ontario, the white pine province, which fell off by $1.50.

Minnesota alone of the American states exceeds Ontario in white pine production. The cut in Minnesota for 1909 was 1,308,861 feet, 235,248,000 feet more than Minnesota's cut of 1908 and 304,241,000, 23 per cent. greater than the cut in Canada for 1910. The average price in Minnesota in 1909 was $17.23, as compared with $22.33 in 1909 in Ontario, and the average price in the United States was $18.16, as compared with $21.55 for the same year in Canada.

Douglas Fir Production

Douglas Fir:—This in Canada is confined almost exclusively to British Columbia, where it is the chief timber. A small quantity is cut on the eastern slope of the Rocky Mountains in Alberta.

The Douglas fir cut of 717,476,000 feet in 1910 was an increase of 32 per cent. over the 1909 cut. This was cut by 146 mills of which only two were in Alberta, so that Douglas fir has the second largest average mill run of any species—3,215,000 feet per mill, being exceeded by Yellow pine. The cut of fir in Alberta is almost negligible, forming only 1 per cent. of the total.

(To be continued)

The Retail Dealer and His Problems

Make Orders Explicit—Concrete Foundations for Lumber Piles

How Mistakes Arise

The importance of being explicit in making out orders is continually being brought home to the trade by sad experience, and it is funny that so few profit by their experience. George Wilson Jones, writing on this point, in the Southern Lumberman, tells of a visit he once paid to a large manufacturer. He was one of the larger yellow pine operators and I thought it a fine opportunity to get his opinion on a matter that frequently comes up in a retailer's experience, says the writer. You have all had such experiences and what he said may help you to avoid them. In my talks with retailers, I am frequently told of exasperating delays caused by the stupidity of wholesalers in not understanding orders, or in shipping something the order does not call for.

"Why is it?" I asked, "that when a retailer sends in an order that is perfectly clear, the wholesaler botches it up and sends him stuff he didn't call for, Do you think they know better than the retailer what he wants, or are they trying to work off some truck that is accumulating but that they have no ready sale for? There isn't always so much of this, but when you don't want a thing, a few pieces are annoying."

"Can't agree with you Jones. You're wrong altogether. No wholesaler wants to send a single stick the order don't call for. He knows if he does, he's bound to stir up a hornet's nest, and we have enough trouble without hunting it. The fault's all with the retailer. No doubt, as you say, the order's clear enough to him, because he knows all the circumstances, but that's no sign it's clear to the wholesaler. You'd be surprised if I'd tell you how many orders come in that are either vague or absolutely wrong. This is especially annoying when it's marked 'Rush,' for we hate to take time to write and find out just what he means. When a man sends in a rush order and finds a letter from us in the mail next day or day after, he thinks it's an invoice, and when he finds only a letter asking for information, he gets hot."

"Well, you can't blame him, can you? It's your business to understand the orders even if a retailer doesn't use the technical terms."

"Let me give you an illustration and I think you'll see it differently. A man sells a barn bill, say, sits down and writes us the order, but don't put in just the point that is necessary to make the order plain. There's not one order in ten that's made out properly. Something is left to guess at, and if we guess wrong, we can't convince him it's his fault. For instance, an order comes in for some boards with the lengths written 10—20. Now does this mean 10 and 20, or 10 and all intermediary lengths up to and including 20? To be sure the man knows, for he's ordering for a special purpose, but how in blazes are we to know? If we jump at it and send 10's and 20's and find he wants all the intermediary lengths as well, you see we're in bad."

"Well, I can see the force of your argument, and as you've got your experience to back you up, you're probably right, but couldn't you avoid such a mistake by sending an acknowledgement stating just what your interpretation is?"

"We do, but how many retailers take the trouble to compare our acknowledgement with their order and see if we have the right idea? We find that these acknowledgements are taken as a matter of form and never looked at. If we make a wrong shipment and to defend ourselves refer the consignee to our acknowledgement, he comes back at us about this way: 'I write my orders plain enough and don't see why you can't understand them. I never bother with your acknowledgements.'"

"I suppose your salesmen use this as an argument to have a retailer give them an order rather than risk it being misunderstood if they mail it."

Maybe they do, but you'd be surprised how many salesmen make the same sort of mistakes. We instruct them to watch out for all these points, but they don't do it. They get interested and forget to clear up these ambiguous parts of an order. You see the customer has told them about the job and the salesmen fall in with their notions and make the identical mistakes. If we could educate the retailer to pay attention to the acknowledgements, a big source of trouble would be avoided. We find all these wholesalers up against the same proposition."

Now here's an idea worth thinking over. I really don't know how many of the Lumberman's readers have had an experience of this nature, and most may think it dull reading, but it's fair to presume it won't do any of us a great deal of harm to be a bit more careful both in the wording of our orders and in looking over the acknowledgements.

This matter of errors suggests another phase of the mistake question. How many employers do you suppose would tolerate a clerk who made the mistakes they themselves are guilty of? If the man in the yard lets some poor cuss get away with a bundle of lath without planking down the money, he's jacked up good and proper, but that same employer will himself sell a whole car of lath to another customer whose credit is not a whit better and pat himself on the back for being a good salesman. It is true that when an employee makes a sale which is sure to be a dead loss, he is robbing his employer, but what about the employer's responsibility to his men? The employee gets his living out of the business just as surely as the man who invests his money in it, and if by the accumulation of bad debts, the owner can't afford to raise his employee's pay, he is depriving them of what the investment of their time in his service entitles them to. Take for instance your bookkeeper. He has worked faithfully and feels he is entitled to a raise, but is informed that business won't stand it. Why won't the business stand it Simply because the proprietor has so many "lame ducks" on his books that it hurts him to buy a postage stamp, to say nothing of adding a hundred or two to the bookkeeper's salary. Then there is another sort of mistake the boss makes at times that he ought to take the blame for. I think I can illustrate this best by mentioning a case that came under my observation. While in an office one day I heard the stenographer get a stiff call-down I didn't think she deserved. Sure, she was an attractive young lady with fluffy blond hair, but really that did not make any difference. I'd have felt the same if she'd been homely as a rail fence. But I'm losing the point of the argument. The boss had dictated a quotation on some timber for a factory and told her to quote f.o.b. factory site, but she wrote merely "f.o.b.," and the contractor naturally enough interpreted this to mean that he would have to haul the stuff from the railroad, and as he had another quotation delivered on the ground, he accepted it. The girl defended herself by saying her employer had himself read the letter and signed it, but this was not taken as a valid excuse. Maybe it wasn't, but suppose one of the other clerks had o. k.'d that bid and not noticed this discrepancy, don't you think he would have "got his?" It's just such little acts of injustice that dampen the clerk's ardor and detract materially from his efficiency. Too many employers have the unhappy faculty of upsetting things generally whenever they are around, and my observation teaches me that martinets are not all confined to army officers.

A week or two ago I had something to say about the retailers' associations, and since then have had a very pleasant visit with the secretary of one of the associations in the middle west. He's a hustler, and one would think his lumber business would be all he wanted to burden himself with, but his enthusiasm is such that he does not neglect his association duties in the slightest degree. I don't know what salary attaches to his position, but I do know that the members are getting the services of a well-trained mind at bargain day rates. From some things he showed me, I am inclined to think the retailers of that state, or at least some of them, imagine they are doing him a mighty fine favor by letting him fight their battles and paying him in sarcasm. During our talk I asked him if he got a jolt when he thought he was doing his prettiest to serve his constituents.

"Well, I should say so;" and turning to his files fished out a letter from a man that read something like this: "About five years ago you refused to make a wholesaler pay me a commission. I'm done with you and you can go to H—l with your combination to help the wholesaler."

"What do you think of that for a lemon?" he asked, after I laid the letter down. "I don't know what he refers to, but that's a fine sort of a letter for a business man to write. I got that in reply to a letter inviting him to join the association. Well, I'm mighty glad he's not on our books. Here's another one," and he tossed over a letter that from its general appearance must have been written by one of the better grade of retailers. This letter informed him that they had better use for their money than to support him in idleness, smoking cigars, his feet on the desk, chatting with his stenographer. Still another one was from a man who said he would gladly join if he could guarantee freedom from competition.

"Well, you sure have some strange fish in this pond, but what about the man who really believes in the association; doesn't he treat matters more intelligently?"

"Here's a letter from one. It came this morning. I think it will answer that question for you." It was a complaint of a car shipped in by a wholesaler and requesting the secretary to visit dire punishment on the culprit, but he failed to give anything but the car number, excusing himself on the ground that he supposed the secretary had a way of finding out the consignor, point of shipment, etc.

"That's a sticker! What the deuce can you do?"

"Search me!" I can't get this information, and yet if I don't do something, he's apt to think I haven't tried. You see if this was a regular business, we could fire such a letter right back and tell the writer to fill in the omissions himself, but the association is after all something of a social organization, and we can't be abrupt with a member. This man didn't mean to write a foolish letter, and probably is honest in thinking we have some secret way of getting the information. Why, Jones, if we had the machinery to follow up the blind trails we are set on, we'd have the Secret Service skun a mile! There's hardly a day we don't get a request for information without a hint as to how to go about it. In most cases the man could get the information himself if he'd only use his wits. We have cases like these right here in our own business so I know what I'm talking about."

Adaptability of Second Grade Oak Flooring

Very often architects and contractors use the Clear Plain (first grade) of oak flooring in many rooms where the Select Plain (second grade) could be utilized equally as well, at a saving of about 25 per cent. in the cost. Select Plain (second grade) makes a floor just as serviceable as the Clear Plain and equally as durable. The principal defect in this grade being sap, which in oak is not considered as serious a defect as in other woods, on account of the tannic condition. The difference in the shading is easily lost sight of in the finishing, by application of a golden oak filler to blend the light and darker pieces. Such a finish would make it very difficult for even an expert to distinguish it from the Clear (first grade).

The Select Plain (second grade) will fill every requirement where a medium priced floor is desired, whether it be in apartment houses and such character of buildings, residences, stores, public buildings, club houses and hotels. This class of buildings requires a high class and serviceable floor. Select Plain is highly recommended, as it gives an artistic and durable floor at a very reasonable cost.

Some of the best homes, costing from $7000 and up, are now using the Select Plain in the upper floors and very often the entire residence uses this grade throughout.

A little care on the part of the floor layer, with this Select Plain (second grade) will insure a job almost as good as though the Cedar (first grade) was used. Bad discolored pieces should be utilized for places under the rugs, closets, and other out of the way places.

The Select Plain oak flooring is manufactured in the 13/16-inch thickness and ⅜-inch thickness. The ⅜-inch thickness Select Plain without a doubt makes the most economical floor that can be bought. It is tongued, grooved and end-matched. It can be secret nailed and when laid, has the appearance of heavy flooring. The ⅜-inch thickness should always be laid over a subfloor. In old homes it can be laid over the old floors and in new homes over a cheap subfloor. The 13/16-inch thickness makes the most substantial floor but is 30 per cent. more expensive than the ⅜-inch thickness. Oak flooring can be had in two colors, white or red. The preference for either, simply resolves itself into a matter of taste, as both have about the same lasting qualities. The white is often preferred, because it runs more uniform in color.

Concrete Foundations for Lumber Piles

One of the many uses to which concrete has been adapted is for foundations for piles of lumber, experiments having demonstrated that the use of such foundations tends to improve the stability of lumber piles, leaves the yards clear of debris, thus making a better fire risk and at the same time involves a distinct economy. In Hardwood Record an account was published recently of the manner in which concrete foundations were made by a United States firm. In the preparation of the mixture they used four parts of bank gravel and one part of cement, making the blocks of the following sizes:

16 x 16 inches.—4 inches thick.

16 x 16 inches.—6 inches thick.

16 x 16 inches at the bottom tapering to 12 x 12 inches at the top, 6 inches thick.

16 x 16 inches at the bottom tapering to 12 x 12 inches at the 6 inches thick.

In making these blocks they employed a plank platform made of dressed lumber laid on the ground on which the mixing was done, and a similar platform for moulding the blocks. These forms were made of dressed boards 4 in. and 6 in. wide, without any bottom to them, the forms being laid on the platform, filled with cement flush with the top edge of the forms and the surplus cement scraped off with a straight edge. As soon as the cement was firmly set the blocks were removed from the forms and stacked up for thorough seasoning before using them. It is well to paint the inside of these forms with common black lubricating oil, so the cement will not stick to them.

The bevel-shaped blocks will readily come out of the forms by turning them over, but the cement blocks with the straight edges are hard to remove without taking a hammer and drawing the nails slightly at one corner of the form. The forms for rectangular blocks could be hinged together at three corners and the fourth supplied with a hasp and staple, and readily be released from the concrete.

They discontinued using any planking for foundations, and eliminated the use of timber for blocking as fast as it rotted out. So far they have found the cement scheme very desirable. When the lumber is removed from the bottoms each time, they find there is no rotten plank to handle, and their yards are much more acceptable as a fire risk, as there is no debris to catch fire from sparks that fall from the mill or locomotive smokestacks. The object in making the rectangular blocks in two thicknesses was for building the foundations, as sometimes a 6-in. block will be thicker than will be required for an inner foundation, and they arranged their piling bottoms to slope three-fourths of an inch to the foot in length of pile.

In mixing the cement for these blocks, the mixing boards can be located anywhere that is handy for the delivery of the gravel, cement and a supply of water, and then carried on tramway cars or lumber trucks to the points where they are to be used.

Manufacturers and Retailers

The manufacturer and retail dealer should co-operate in the manufacture and distribution of forest products, to the end that the consuming public may be best served, and any unnecessary waste eliminated. The close association of the retail dealer with the consumer enables him to become familiar with the requirements and demands for the various kinds of building materials. To meet these requirements, as nearly as may be, and in a manner that will produce a reasonable return on the money invested and the effort put forth in his business, is the principal object of the retail lumberman.

The manufacturer is necessarily better informed regarding the economical manufacture of forest products and is in a position to take measures toward the elimination of wasteful methods in manufacturing. No actual saving results, however, unless the material we would save can be put to some beneficial use. The co-operation of the manufacturer and retail dealer, therefore, is important if the greatest good is to be accomplished in the introduction of new standards and in the more economical use of forest products.

Several questions have come up during the past year that retail lumbermen and lumber manufacturers were unable to see in just the same light. All of these questions are of mutual interest and should be discussed freely and candidly. I have always found the individual manufacturer such a good fellow that I am able to think of manufacturers collectively as desiring to take an unfair advantage; neither am I ready to believe that it is the desire of any number of retail lumbermen to ask for anything that is not fair and equitable. In my opinion it is only a question of conferring together.—C. B. Channel.

At a recent sitting of the Dominion Board of Railway Commissioners at Calgary the Mountain Lumber Manufacturers' Association through their secretary, W. A. Anstie, asked an order directing the C. P. R. to provide a tariff schedule on lumber on shipments from the interior of British Columbia to points on the Grand Trunk Pacific via Camrose. A previous order of the board had directed the railroads to supply these through tariffs, but the two roads had been unable to reach an agreement. The commission ordered that the traffic managers should get together and attempt to reach an agreement.

MANY THANKS

A new subscriber has this to say of the CANADA LUMBERMAN:—

"Best journal and fairest in the land."

Panoramic View of Cleveland-Sarnia Saw Mills Company's Plant, Show

Cleveland-Sarnia Saw Mills Co'y

Interesting History of Progressive Ontario Concern—Modern Plant Producing Forty Million Feet Per Year

Pictured for years upon the minds of every one of the thousands of men, women and children who pass up and down the St. Clair river during navigation season are the massive piles of lumber which extend nearly three-quarters of a mile into Sarnia bay, almost bridging the river between Canada and the United States.

To those initiated into the mysteries of the lumber business, the picture is all the more impressive because it at once conveys to their minds the unsurpassed location of this gigantic manufacturing industry from both a manufacturing and distributing standpoint.

This splendid property was selected in 1901 by the Cleveland Saw Mill & Lumber Company, of Cleveland, Ohio, to perpetuate the business carried on by them at Cleveland, Ohio, and Marquette, Mich., and the name chosen for the new Canadian enterprise was The Cleveland Sarnia Saw Mills Company, Limited.

It might appear an easy task on the face of it for a company with plenty of capital behind it to come along, buy up limits in Ontario and start a manufacturing plant on such a site—but difficulties lay in the way. In the first place the property was owned by parties in various parts of the country. Mr. J. M. Diver, the enterprising General Manager, had an interesting story to tell the "Canada Lumberman" representative about the countless troubles he had in rounding up the owners. He went all the way to Kentucky to follow up an actor to purchase from him a strip of eighty feet which he inherited.

The mill property and booming grounds occupy 276 acres with a frontage of 3,078 feet on the St. Clair river and a depth extending nearly 3,000 feet to the river channel. The lumber is piled two rows deep along the main tram, affording piling capacity for close to 25,000,000 feet. Slips on both sides afford easy access for loading lumber on vessels while a tramway underneath the main tram affords facilities for loading lumber on the cars.

The main mill, which is devoted largely to the sawing of the good end of the product into boards and planks, is 60 x 160 feet in size, with an L sorting house attached that is 40 x 140 feet. South of this mill is the company's timber mill, which is 40 x 204 feet in size and saws timber up to 65 feet in length. Between the two mills is a brick, stone and cement power house 50 x 136 feet. The center of this structure is occupied by a splendid battery of six boilers, of the Dutch oven variety of furnaces, which are automatically fired. On either side of the boiler room are located the two engine rooms, each of which contains Corliss engines of the most modern type and efficiency, the one running the larger mill being 24 x 42 inches in size. The entire power plant equipment was furnished by John Inglis & Sons, of Toronto, Ont.

The board mill is equipped with two Allis-Chalmers single cutting band mills. The general saw mill equipment is from the same company and comprises all its most modern saw mill equipment in the way of carriages, timber planers, log decks, live rolls, steam niggers, trips, edgers, trimmers, slashers, lath mill and curtain roll manufacturing equipment. The mill frame is of the most substantial character and is placed on a massive foundation, while the general equipment has strength enough to handle timber of the largest size.

This great plant is built on piles, 16,000 of them. The lumber is of course piled over the water, and the management claim they are repeatedly proving that the drying of lumber can be accomplished more quickly by piling it over water.

The mills run winter and summer. In winter the bay is kept from freezing by condensation from the plant of the Dominion Salt Works, Limited, a subsidiary concern, with plant adjoining the saw mills. This company operates one of the largest salt blocks in Canada.

The annual output of the mill is about 40,000,000 feet. The company have large quantities of standard grades of white pine and norway always in stock, but a specialty is made of special bills of norway, white pine and of Douglas fir timber brought from the Pacific Coast. These different classes of timber are available for

Cleveland-Sarnia Saw Mills Co.—92,000 Pieces Towed in One Raft.

the Splendid Yard and Shipping Facilities Possessed by the Company.

manufacturing special bills in any sizes and in lengths from 10 to 60 feet.

The company own large timber limits in the Georgian Bay district on the Spanish and Vermillion rivers, whence the logs are brought to Sarnia by water, being towed over the lake in large bag rafts that are made up at the present time at the mouth of the Spanish and Whitefish rivers, and towed down Lake Huron. The logs are put in bags of three million feet or more; one raft brought down in 1902 contained six million eight hundred thousand feet.

Large timber limits are also owned on the upper Ottawa river near the Temiskaming and Northern Ontario Railway, where the company own and operate the Diver & Ottawa River Railway, a standard gauge, from Diver Station, (on the T. & N. O. Railway south of Cobalt), running to the Ottawa river. From these limits long timber is brought by rail to Sarnia in specially constructed sixty-one foot cars as well as standard equipment, and in trains of twenty to twenty-five cars over the T. & N. O. Railway and the Grand Trunk Railway System, with an average delivery of a train a day. The railroad haul is four hundred and eleven miles, being, as far as known, the longest distance that logs are railed in America.

The plant of the Cleveland Sarnia Saw Mills Company, Limited, which is one of the largest cutting white pine in either Canada or the United States, is particularly well situated from a distributing standpoint both by water and rail. By vessel the plant is only twelve hours from the chief lumber distributing centers at the head of Lake Erie. By rail it has fine lines of outlet, including a chief trunk line from Chicago to Buffalo, with branches that cover all parts of Michigan and the Province of Ontario, and with connections that reach from the extreme east to the territory lying south of Michigan. By means of the Lake Erie & Detroit River railroad, sixty miles to the port of Rondeau and fifty miles by car ferry to Conneaut, the company has direct connection with several Ohio roads, which will give its product as quick access to all Ohio and western Pennsylvania points as can be secured from any of the lower lake distributing centers. Sarnia is, in fact, the center of the largest white pine consuming territory in the United States and Canada. One day will take lumber from this point to Buffalo and to almost all Michigan points, while two days will secure its delivery to nearly any Ohio point or to Pittsburg territory. Freight rates from Sarnia are low enough so that business can be satisfactorily handled throughout all territory in Michigan and east of the Indiana state line. The quick delivery possibilities from this plant are a great factor in securing a very large share of the rush order business of both Canada and the United States in white and red pine lumber and timber.

The president of this successful concern is Mr. A. F. Holden, the well known capitalist of Salt Lake City. Mr. Holden is a man of wide business experience and has large timber holdings in California and mining properties in the United States and Mexico.

Mr. F. H. Goff, of Cleveland, Ohio, is vice-president. He was one of the leading attorneys of Cleveland, and for several years connected with the firm of Kline, Tolles & Goff. He severed his connection to accept the presidency of the Cleveland Trust Co., one of the largest financial institutions of Cleveland, which position he now holds.

The active management of the company however is in the hands of Mr. J. M. Diver, general manager, and Mr. E. C. Barre, assistant manager, two lumbermen of long experience.

Mr. Diver, who was born in Cleveland, Ohio, entered the employ of the Cleveland Saw Mill & Lumber Company at the age of 15. He started in as slab carrier and has filled almost every position in the mill up to sawyer and in the yard up to lumber inspector. In 1880 he went into the office as assistant bookkeeper and the following year took entire charge of the books and became secretary and treasurer of the company. In 1894 he was made general manager. In 1901 he moved to Sarnia, Ont., and organized the Cleveland Sarnia Saw Mills Company, Limited, which has been in successful operation ever since.

September 30th, 1879, Mr. Diver became a benedict, marrying Miss Ellen J. Bieder, of Ashtabula, Ohio, from which union were born two sons and one daughter. Mr. Diver is now the proud grandfather of five.

The assisting manager, E. C. Barre, is a native of Michigan, having been born in Reading, May 18, 1871. When he was 5 years old his parents moved to Greenwich, Ohio, at which place Mr. Barre received a common school education.

Cleveland-Sarnia Saw Mills Co.—Towing a Raft to the Mills.

Home of Mr. J. M. Diver at Sarnia, Ont.

A Glimpse of Mr. J. M. Diver's Beautiful Garden.

At the age of 17 he began working in a small saw mill and lumber yard in Greenwich, Ohio. In 1895 he secured a position with the Cleveland Saw Mill & Lumber Company, at Cleveland, Ohio, as bookkeeper, which position he held until 1898, at which time he moved to Marquette, Mich., as manager of the Dead River Lumber company, a branch of the Cleveland Saw Mill & Lumber Company. He remained at Marquette until 1901, when the Dead River interest was disposed of. He then went to Sarnia, Ont., as assistant manager of the Cleveland Sarnia Saw Mills Company, Limited, and since that time has been of great help to Mr. Diver in building up the fine trade which the Cleveland Sarnia Company enjoys at this time. Mr. Barre married in June 1892 Miss Cora H. Healey, of Greenwich, Ohio. They have one daughter.

Like other men of large business capacity Mr. Diver finds time to give his attention to things outside of his business. Since coming to Sarnia he has taken a particularly active interest in promoting the welfare of the town. He held the position of president of the Board of Trade for three years, and is now First Deputy Reeve, to which position he was elected by acclamation. "He can have any office in this town that he cares to fill," was the way a leading Sarnia man expressed his appreciation of this lumber magnate.

Mr. Diver is also particularly fond of his home which is one of the finest in a town noted from one end of Canada to the other for its attractive residences. His beautiful lawns, flower gardens, and green houses are the envy of every big city man who visits them, and Mr. Diver always takes particular pleasure in showing them to his many visitors from Canada and the United States.

Readers of the Canada Lumberman and Wood-Worker will also be interested in knowing that Sarnia will soon have another flourishing industry. The Canadian Woodworkers Limited are now erecting a large modern plant for the manufacture of doors and interior finish. This new plant will be ready for business about the first of January next.

Hardwood Flooring Economics

In the race for business which determines the survival of the fittest, the flooring manufacturer who watches his plant and its workings considerably closer than the traditional hawk watches the defenseless chicken, will find himself amply repaid in the discovery of short cuts and will clip off a bit of useless expense here, increasing the output a little over there and then raising the standard of grade in his product when another opportunity offers, says Hardwood Record. Ultimately that establishment is going to work with the least possible cost of operation, the maximum degree of quality obtainable, and the largest output of which its proportions are capable. With the flooring market as it has been for the past several years this is a point worth considering.

Circumspection in plant management, like virtue in all things, is its own reward. Several years ago the owner of a big flooring mill in the South was walking through his stock yard and the thought came to him, as he noticed a gang of husky but lazy negroes unloading a car of lumber, that the lassitude of his help was costing him a big surplus in yard expenses. Then he noted with a sort of twinge that each of those half a dozen "coons" was commanding $1.50 per day and further investigation showed that it required by far the best part of a day for them to carry twelve or thirteen thousand feet of strips from the car to stack in the yards. "Nine dollars per day—all practically useless expense, for the stock has to be rehandled from the stack," mused the millman, and he set to work to devise a system which would cut out the unnecessary drain.

The result was that in short order a neighboring foundry firm received a contract to manufacture for the hardwood flooring man a "home made" conveyor, the first of its kind adopted in a hardwood flooring plant. Inasmuch as stock, in this case as in many others, could not be handled direct from car to drykiln, the conveyor system had to be easily portable and capable of extension to any portion of the mill yard where there was room for a stack to be erected. The system consisted of a series of 12-foot ladders, about a dozen in all, which afforded an entension of 150 feet from the railroad switch to any part of the yard. The ladders were very durable, with steel frames containing hardwood rollers, iron bound and mounted on roller bearings. The mill owner figured that a chain of such rollers extending from car to stack would enable strips to cover the intervening space in double-quick time, saving labor and consequently expense, and he was right.

Nowadays when a car of strips is received at that plant it is shunted onto the siding and before the yard boss can say "Jack Robinson" very many times, the roller ladders have been coupled and laid on a gentle slant supported by trestles. One man gets

Unloading Logs at the Mills, Sarnia, Ont.

J. M. Diver, General Manager
Cleveland-Sarnia Saw Mills Co.

into the car and another one, or possibly two, get at the receiving end and a steady stream of strips moves over the rollers. No matter how a stick is placed on the conveyor, straight or diagonal, it will travel without falling off until the end of the line, for the gravity system is such that the rollers carry the piece in the same position in which it started.

And take notice: the flooring operator has figures on the following results from his "home made" conveyor. Two or three men are required to unload a car now instead of six as formerly when the strips were carried on the shoulders of the men. Three men working can dispose of an average car containing 13,000 ft. or thereabouts in half a day at $1.50 per day. The cost of handling into the yard with the conveyor, therefore, amounts to $2.25 per car instead of $9.00 as heretofore, and the work is done more satisfactorily than by hand. As far as the equipment is concerned those ladders will never wear out. And this comparatively simple contrivance, born of experience with useless expenses, is saving its inventor something over fifty cents on every thousand feet of lumber he handles in the yard by reducing car-to-stack handling expense from sixty-nine cents to seventeen and one-third cents.

The popular twentieth century demand is for a "wide assortment" in all kinds of trade. The hardwood flooring man found this out some time ago and accordingly he is preparing new styles of parquetry and fancy work, and is introducing new material and grading his stock more carefully all the time. But this feature, although elevating the standard of business because the public taste can be met in all of its vagaries with a suitable variety of flooring, tends to make more expense for the mill owner to bear, since he will find himself hopelessly "balled up" with a tangle of assortments, widths, lengths and grades unless he keeps his stock room thoroughly systematized.

Realizing this feature of the business which demands that quartered oak, plain oak, streaked oak, etc., must now be placed on the market where there were only general classifications a few years ago, a big flooring worker in one of the cities of the Ohio valley designed and constructed a big stock room contrivance which makes all processes of classification for grades and lengths as simple as A, B, C. The arrangement was installed in a roomy space behind the trimming saws and matchers, and is designed to receive flooring which is thus thoroughly classified until it is bundled and placed in the dry room. This system is now generally adopted by hardwood flooring manufacturers.

E. C. Barre, Assistant Manager
Cleveland-Sarnia Saw Mills Co.

At a glance the affair looks like a wooden framework for a miniature skyscraper. It extends from ceiling to floor, the tiers being divided into compartments one foot square and each vertical set of apartments being one foot shorter than its neighbor. The tiers denote grades and classes of stock, while the vertical classification denotes length, the compartments being all the way from five to sixteen feet long, with one foot variance in each one. The invention is a wonder-worker for smoothing out snarls apt to arise in attempts to make up a shipment from a mass of badly assorted flooring, for in the numerous pigeonholes everything is in its place and quick selections as to exact grade and length are afforded. One of the most common and unfortunate proofs of poor plant management is evidenced in debris, odds and ends of all sorts scattered through the workshop and yard. Such disorder in mill maintenance offers more danger than is evident at first glance, for the rubbish not only interferes with operations of the workmen and causes considerable personal discomfort, but also possesses lurking menace because of the danger of spontaneous combustion and its propensity for clogging up machines and causing unnecessary expenses.

About four years ago a man started an up-to-date flooring plant not far from the Mason and Dixon line. Even though a beginner in the field he saw that debris about his establishment contained many dangers and an iron-clad rule went into force to keep waste material where it belonged. Accordingly the blower which emptied the sawdust from the establishment into the yard was pointed down at the ground and its flying particles were directed upon a steadily growing pile. Every fifteen minutes, by an automatic contrivance, a wire brush attached to the mount of the blower swept down and cleared away a little space for the stream of fine wood particles to continue without rising to clog the mouth of the pipe. All waste strip stock from that plant is cleared up after each day's work just as the janitors of a big office building clear the apartments of waste paper in the evening.

The strips are piled neatly in an unused portion of the yard for sale as kindling. Blocks and other short stock still available for parquetry and fancy work are tossed into a big bin by the clean-up force at the end of each day and one day or a portion thereof out of every week is set aside to work those odds and ends into whatever they may make. This painstaking system may seem too pedantic and "woman-like" to the flooring mill operator who does not utilize such methods of housekeeping, but the mill owner referred to asserts that it is one of the most important of plant-efficiency increasing methods which he has used and which has enabled him to run without a day's shut-down except on Sundays and holidays since he started four years ago, incidentally doubling the quantity of his output every year that he has operated.

Cleveland-Sarnia Saw Mills Co.,—Logging at Nairn Centre, Ont.

At a meeting of the Lumber Merchants' Section of the Retail Merchants' Association of Canada, Montreal, held on October 9th the question of the inspection, grading and measurement of lumber was discussed. It was, however, decided that before any definite action be taken the secretary, M. Beaudry, should communicate with the Retail Lumber Merchants' Association of Toronto in order that the two associations may co-operate on the question.

The Smart-Turner Machine Company, Limited, Hamilton, have obtained the contract for the pumps for the new pulp and paper mill of Price Bros. & Co., at Jonquiere, P.Q.

THE WOODWORKER

Making and Stiffening Brazes in Band Saws

Cleanliness is one of the first things to take into consideration; it increases human happiness in making successful brazes, says F. R. in The Wood-worker. In the first place, a saw must be cut off perfectly square. The laps should be either ground, cut or filed, but in either case they should fit exactly over one another. I prefer a lap-cutter, on account of its great accuracy. If the machine and the cutting burr are in good condition, it will cut the lap perfectly. Some filers don't like them on account of having to use oil on the burr. This should be threading or lard oil, for machine oil won't do.

It is no trouble to clean the lap and 2 or 3 in. farther back than the lap. Take muriatic acid and powdered borax ("Twenty-Mule-Team" borax is all right). Mix the two together in a glass or broken bottle, spread a thin coat on the lap and a little farther back. Let it remain there for a few minutes, then take a bunch of waste or rag and clean it off. Now take powdered borax and sprinkle over the lap, then take a clean rag or waste and rub till every particle of grease and dirt is off clean on both sides. Never touch the lap with your hands after you have cleaned it.

Your saw is now ready to put on the brazing bench. Clamp it down so the laps fit over one another, with the back edge straight. When you get ready to braze, I advise you to not use borax or acids; use some brazing compound, for instance, like Gebott's Brazine. Some filers say it is too expensive, but if you take into consideration how little it takes to make a braze, and the good results you get, it is not expensive. After you have clamped the saw down raise the upper lap, drop a little of the brazine on the lap, take a small white pine stick and spread it over the lap, then let the upper one down on it so that both laps are moist.

Now cut your silver solder the right length. If your hands are not clean or are perspiring, don't touch it with them. A nice way to handle it is to get a 10c pair of cotton gloves and use them for this purpose. After you get through, lay them away and keep them clean. Next take a piece of very fine emery cloth and clean the solder, then rub with a clean cloth or waste, and it is ready to go between the laps. Raise the upper end, start it between, then drop a few drops of brazine on it. Take your little pine stick and spread it, then push it between the laps.

You are now ready for the irons. They should be smooth and straight. If the corners are sharp, file them a little, rounding to keep from marring the saw. About ¾ x 1½ in. is nearly right for ordinary large saws. You should always start your fire early enough to give the coal time to coke a little, as you can get a better heat on your irons that way. Heat to almost a white heat, but be careful to not burn the irons. The condition of the weather has some to do with the way the irons appear when hot. On a dark and gloomy day they will appear hotter than they really are, whereas, on a bright day, they are hotter than they look to be. It is always well to take this into consideration.

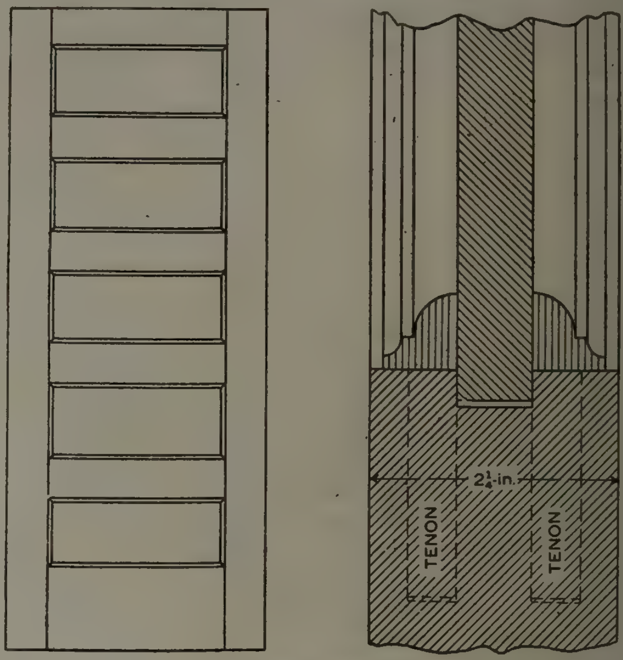
Having your brazing bench ready to receive the irons, and the irons hot, first scrape all the scale off; do this quickly as possible. Have a helper bring the lower iron to its place, then push the upper one over it, but don't touch the saw. Bring them straight over one another, centre over the braze. Now clamp them down and be careful that the saw remains in the same position you put it, or you will get your braze out of shape. Loosen your clamp screws on the end of bench a bit.

To stiffen the braze, have everything in readiness before you start the work. I have a small hand-bellows, about 20 in. long, 10 in. wide; I think they call them molders' bellows. In brazing a saw 16-in. gage and heavier, take a rag or bunch of waste, wet it and brush along each side of the irons three or four times as soon as you have them clamped on. Take the hand-bellows and blow on each side of irons, on the saw, as hard as possible. Note when your irons get dark or turn to a purple, then loosen up and take them off. Now pull the saw endwise, take your bunch of wet waste, run over the braze once, then take your blower and blow back and forth over the braze, and blow hard. It takes but a few seconds until your braze is cooled. This must be done in a hurry, or it won't amount to anything, and the irons have to be taken off at the right time. With saws thinner than 16-gage it is not necessary to use any wet waste; the blower is sufficient.

Now smooth the braze up with a file, a little on each side, and rub with a piece of coarse emery cloth. Then roll the braze from edge to edge by starting in the centre, lightly on the edges. Roll about 1 in. apart, then in between those points, not very heavily. Now finish dressing the braze, then roll, tension, level up, and see if the back is in line. If you have a braze that bends very easily, it might be well to roll it from edge to edge lightly. A few times over will stiffen it sometimes and help very much; then tension and level up.

A Problem in Door Tenoning

In the course of one's experience who follows saw or planing mill work, he runs up against a great many seemingly hard propositions. We received an order, some time ago, for a number of 3 x 7—2⅛ solid oak doors. Having only a small hollow-chisel mortiser, we decided to machine them with double tenon, like sketch. We tenoned full width and took center of tenon out with grooving saw; stuck square, and molded two sides.—W. W. in The Woodworker.



The Problem

Where the Foreman Fails

By W. H. Bradner

Say! did you ever go into a factory and notice how many of the small things are neglected?

I was in a large concern some days ago and noticed that it had just been belted and the leather belts were put on with point of lap on the outside pointed in the direction of its travel, and the man in charge claimed to be a "belt man." An experienced mill man knows a belt will open up in the lap on the outside nineteen times out of twenty if it opens at all, and if the point of lap is toward the opposite way of travel it will very seldom open at all.

I also saw an old experienced jointer man setting his knives in a two-sided head and he was using a two-foot rule. Now, that would be all right no doubt for some classes of work but a good jointer man who makes joints ready to glue does not set knives that way.

How does he do it? Why, he sets the knives by a straightedge on the rear or back bed, thereby bringing the cutting edges up to a line with the bed, so that if the belt has worn the bearings up or down, as the case may be, it does not affect the joint as it does when the knives are set by the rule from the head. You know how you feel when it is none of your business.

A 24-inch pony planer was running close by, and as I had to wait to see the manager on business I watched that planer. The stock they were dressing was 20 inches wide and 36 inches long. By the time they had dressed about twenty-five pieces, I noticed the pile kept leaning over farther and farther as each additional piece was put on by the boy off-bearer. I said to the planer man, "Does it not make a difference if those stand tops are 1-32 inch thicker on one endge than they on the other" He replied, "No, oh no; the big sander finds that and makes them all the same clear across."

Now, what do you think of that, and who is to blame? The foreman of this concern was the only man around the plant that knew the details and he was a very busy man. The management knew him to be a hard worker but how many managers know of the great number of small things that enter into the daily tasks of their foremen which could be avoided if some thoughtless employee would use his head.

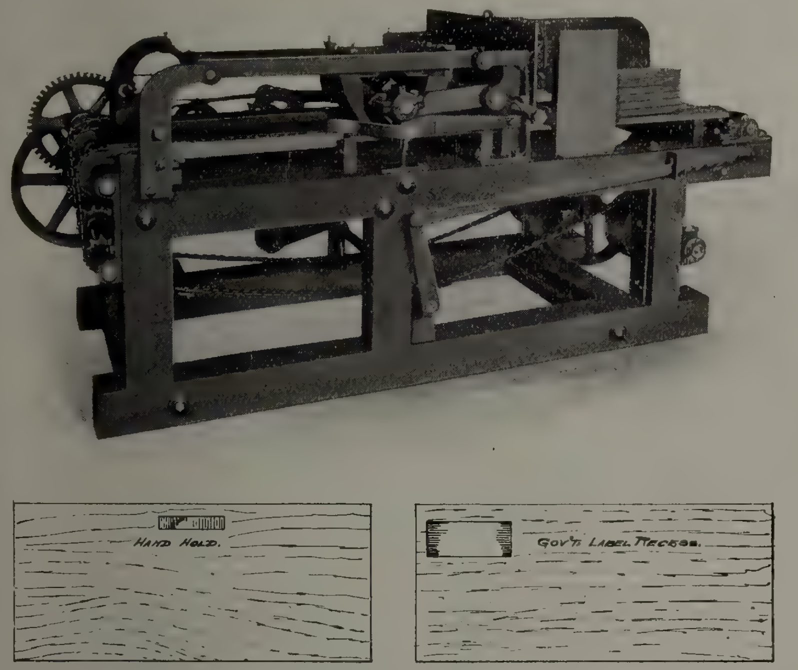
Verily, I say, the way of the transgressor is hard, but after twenty-eight years' experience I find the way of the superintendent and foreman hard, and ninety-nine per cent. of it is caused by some careless or thoughtless employee who is more fitted to carry mortar than to be engaged where accuracy is one of the greatest factors.—Woodcraft.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The Mereen-Johnson Recessing Machine

The Mereen-Johnson Machine Company of Minneapolis, U.S. A., include among their products an interesting recessing machine (No. 420) which is illustrated herewith. Cutting a label recess by hand in the most dangerous operation in a box factory, while with this automatic machine it is accomplished with safety and dispatch. Two boys will turn out more work than four men can accomplish of a similar kind on the ordinary cutter-head most often used for the purpose. The machine will handle stock 20 in. wide by 30 in. long, composed of one or more pieces. Its feed rate is from 36 to 40 pieces per minute. The recess is 3½ in. wide by 5 in. long by 3/32 in. deep. Wider cutting-heads or cam for longer or shorter recess are furnished if desired. The depth is regulated on the machine, from 1/32 in. to 3/16 in.



Mereen-Johnson Recessing Machine No. 420 and its Product

The standard hand hold is ⅞ in. wide by 5 in. long by ½ in. deep. Grooving-head and cam are furnished for any length and width specified. The counter shaft has T & L Pulleys 12 in. by 5 in. and should run 677 revolutions per minute. It is mounted in the frame under the machine when the drive is below and at the side with a floor stand when the drive is above. The machine is operated by 5 h.p. It occupies a floor space 2 ft 11 in. by 6 ft. 6 in. The shipping weight of the machine is 2200 lbs. Its equipment includes one set of knives for cutter-head, one solid grooving head and countershaft which are furnished regularly with each machine. The machine has hopper-feed similar to that on most printing presses.

J. C. McLaren Belting Co. in New Quarters

The J. C. McLaren Belting Company, Limited, who formerly had their belting factory on St. James street and their card clothing and reed factory on St. Paul street, Montreal, have removed all to their fine new factory on Beaumont avenue. The building is 227 x 60 ft., two storeys, and is built particularly with a view to economy in production. It is well lighted on all four sides, the offices being situated on the ground floor.

Machinery of the latest type, both English and American, has been installed and the arrangement of this and of the various departments is such as to permit of the several processes being carried on with great facility, the idea being to obtain a continued process of manufacture thus eliminating loss of time in unnecessary handling of goods.

The sanitary features have been well looked after by the installation of a heating and ventilating system by which they get a complete air change throughout the building every twenty minutes.

The company retain their old warerooms at 292-294 St. James street as a down-town distributing office, and carry a full line of mill supplies including all kinds of leather, rubber, balata and cotton belting, hydraulic leather and perfection fillet.

A New Preservative for Wood

The firm Hartmann & Schwerdtner, of Grosschonau, Saxony, have taken great interest in the art of wood-preserving, with the result that they have succeeded in inventing a new preparation known as "Kulba." Scientific tests have proven this wood preserver to be of practical value and importance. "Kulba" is a solution of zinciferous sodium. The manufacturers claim that wood, when brushed twice with it, will be secured at once against all decay which would cause destruction of the fibres.

Hitherto it has been impracticable to use alkalic solutions in the impregnation of wood on account of their destructive effect on the wood fibre, but now the manufacturers of "Kulba" claim that a solution containing, besides zinc, much alkali apparently in surplus shows a neutral reaction and does not hurt the fibres, but makes them impervious to dry-rot and any other morbid matter. Consequently, they assert, the effect of "Kulba" is due to its absorption of the wood fibre, whereby the albumen of the latter serves as protecting colloids, i.e., prevents a precipitation of the oxyd of zinc. The colloidal alkalic solution of zinc clears all living cells of pernicious matter. From this fact the strong and lasting effect of the new wood preserver, "Kulba," can be easily appreciated. An important feature is the relative low cost of spraying wood with "Kulba," a circumstance of much importance for the building trade.

Arrangements for the largest timber sale ever undertaken by the U. S. government, involving approximately 600,000,000 board feet of merchantable timber, nine-tenths of it yellow pine, are being made by the departments of agriculture and interior. The tract is claimed to be the largest body of good timber left in the southwest, comprising parts of the Apache and Silgreaves national forests and the Fort Apache Indian reservation in Western Arizona. It must be sold to the highest bidded. This sale will bring the government from $1,500,000 to $2,000,000, as no bid of less than $2.50 per thousand will be considered for timber cut during the first five years of the contract, nor of less than $3 per thousand for the cut during the following four years. All the timber must be cut in ten years. Other large bodies aggregating 1,500,000 board feet, will be made accessible. All this will open up good coal lands.

"A GREAT PUBLICATION"

The Victoria Times, Victoria, B. C., referring to the Annual and Camp Supply Number of the Canada Lumberman says:—

"Perhaps no better compliment could be paid to the editors and compilers than to say the work could not have been done better or more effectively and pleasingly than it has been done. It is a great publication."

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

Ten cars 2-in. Log Run Maple. State best price for cash. Box 330, Canada Lumberman, Toronto, Ont. 18-23

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Maple Wagon Axles

Wanted—ten car loads of Rock Maple Wagon Axles, principally 4x5—6 ft.; shipment to commence January 1st. Quote price. D. Ackland & Sons, Ltd., Winnipeg, Man. 20-20

Wanted

250 to 350 M. feet B.M. of spruce timber required, in the round, to be cut the coming winter, and delivered next spring. For particulars apply to J. Sheppard & Son, Box 309, Sorel, Que. 20-23

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Lumber Wanted

We are open to buy a few cars of good common and better dry Soft Elm, Birch and Hard Maple, in 1½ and 2 in. thicknesses. Also give us a list of any other dry Hardwood Lumber you have. Address, The London Lumber Co., London, Ont. 18-21

White Pine Pickets Wanted

We want at once 4-4 x 4-4 x 44 in. and 48 in., 5-4 x 5-4 x 44 in. and 48 in., and 6-4 x 6-4 x 48 in. White Pine Pickets. If you have anything in the above write, stating quantity, when cut and best prices. Will buy any quantity from a car to your entire stock. Box 58, Ogdensburg, N.Y. 20

White Pine

WANTED—White Pine trimmer ends in any quantity and any thickness. Write, stating what quantity you have, what you want for them per cord f.o.b. cars your station, and any other particulars such as how piled, if bright, etc. Address, The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 20-23

FOR SALE—LUMBER, ETC.

For Sale

1,000,000 wooden clothes pins, 50c per 1,000 pins.

1,000,000 broom handles, $10.00 per 1,000 handles.

1,000,000 wooden butter dishes, 80c per 1,000 dishes.

1,000,000 wooden pie plates, $1.50 per 1,000 plates.

Everything in woodenware, will furnish at lowest prices. Write at once to Jos. Werner, Chicago, U.S.A., 1842 North Park Avenue. 20-20

For Sale

Our season's cut of White and Red Pine. We are desirous of disposing of same quickly and invite your inspection of the lumber which is mostly from large run of White Pine Logs. Pine Lumber Company, Pine, Ont., near Chapleau. 19-22

Hemlock and Hardwood

Hemlock, Birch, Maple, Elm, Beech, on C. P. R. near Bala. Private switch. Sawing just commenced. About 750.000 M. Box 345, Canada Lumberman, Toronto, Ont. 20-21

For Sale
BIRCH

20,000 ft. 1 in. Firsts and Seconds.
20,000 ft. 1 in. No. 1 Common.
15,000 ft. 2 in. Firsts and Seconds.
13,000 ft. 3 in. Firsts and Seconds.
4,000 ft. 4 in. Firsts and Seconds.
1,500 ft. 5 in. Firsts and Seconds.

will run good widths and lengths; can be shipped in mixed carloads, if desired

Mercantile Lumber & Supplies Co., Ltd.
20-20 Montreal, Que.

WANTED—MACHINERY, ETC.

Do It Now

Another day gone, and probably the reason you have not sold that second hand equipment of yours is that you have not advertised it in the Canada Lumberman & Woodworker. 19-22

FOR SALE—MACHINERY, ETC.

Operating Saw Mill For Sale

at Uhthoff Station, G. T. R. Capacity 25 M. feet, containing stationary boiler, 80 h.p.; one engine, 50 h.p., and machinery outfit and building. Will accept $1,000 in full to close estate, as timber is done. Apply to W. B. Tisdale, Orillia, Ont. 17-t.f.

For sale at a bargain, one Cowan & Co. planer, matcher and moulder combined; also one combination lock taylor safe. For full particulars address Transient Department, Canada Lumberman. 20-20

Extraordinary Proposition Log Cars

Russell 50,000 lb. capacity standard guage, automatic couplers, airbrakes, 26 in. wheels, strictly first class condition in every respect. Phenomenal bargain, immediate shipment. Write or wire.

DULUTH IRON & METAL CO.,
20-23 Duluth, Minn.

Machinery For Sale

Band saw, 37-inch Clement.
Carver, 4-spindle Rohlman.
One cut-off saw, railway wood frame.
Dovetailer, Boults.
Engines and boilers, various sizes.
Floorer, 9-in. Berlin.
Jointer, chair seat Jenkins.
Jointer, 16-inch White.
Moulder, 6-inch Houston.
Mortiser, hollow chisel, Greenlee.
Mortiser, Smith.
Mortiser, Bit.
Planers, 24-in. single belted.
Sander, double 24-in. Perry.
Sander, three drum 42-in. Boardman.
Sander, three drum 42-in. Columbia.
Saw gummers, Rogers.
Saw mill, band, 63-in. wheel.
Saw and dado machine, Williamsport.
Variety lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Position Wanted

By man capable of taking full charge of logging operations, 50 M. up, stump to mill; married, sober and hustler; a good estimator and buyer of timber, would take charge and look after larger holdings and buy up small lots adjoining. Employed until October 1st; have had experience both north and south. Box 318, Canada Lumberman, Toronto, Ont. 17-20

Experienced man in general lumber business, know from cutting logs to office work by experience. Can furnish the best of references and testimonials. Age 35, married, solid and strong as well as sober. Leopold Pepin, 521 Roy Street East, Montreal, Que. 20-20

Man of 12 years experience in saw mill, office and yard wants position with lumber firm Am an A1 accountant and familiar with the manufacture and grading of northern pine. Position must pay good salary to responsible man and must afford reasonable opportunities for advancement. Box 343, Canada Lumberman, Toronto, Ont. 20-20

Situation wanted by a very practical and capable northern hardwood lumberman, 12 years experience in every detail of the industry from stump to market. Am first class mill manager, inspector, buyer and salesman. Broad acquaintance with both manufactures and consumers throughout New York, New England, Quebec and Eastern Ontario. Best of reference. Open Oct. 15th. Address, P.O. Box 133, Carthage, N.Y. 20-21

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

Wanted—Sash and door factory man with some capital to take interest in factory and lumber yard. Excellent opportunity for man capable of taking charge and estimating. H. J. H. Mathison, Sault Ste. Marie, Mich. 20-21

WANTED—Good, steady, competent man, to take charge of small gang of men, sash and door department of planing mill, in one of the best towns in Central Ontario. Must do the laying out. State age and experience. Box 344, Canada Lumberman, Toronto, Ont. 20-21

Wanted at once—an experienced mill man as shop foreman for sash, door and blind factory, where high class trim and odd work is a specialty. Must be capable of taking off quantities, laying out and billing. Apply with references, stating salary expected and how soon can come, to Box 334 Canada Lumberman & Woodworker, Toronto, Ont. 19-20

BUSINESS OPPORTUNITIES

Water Power Saw Mill For Sale

Sawmill water power, reason for selling, ill health and old age. John Lilie Shea, Ufford, Ontario. 20-20

For Sale

100 acres first-class hardwood timber and water power sawmill, 45 horse power, as a going concern. W. M. Tolton, Maple Valley, Ont. 17-20

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Circular Mill For Sale

For sale, practically new circular mill on Georgian Bay. Splendid shipping facilities. Suitable for cutting either pine or hardwood, and good market for all mill can cut for next five years. Apply Box 239, Canada Lumberman, Toronto, Ont. 20-23

WANTED

Will finance a good mill to buy hardwood logs and manufacture into lumber coming season. Must have basis for at least half million, will contract up to two millions. State all particulars. Box 336 Canada Lumberman, Toronto, Ont. 19-22

Sawing Contract Wanted

Double Band Mill on Georgian Bay, open to contract for early spring sawing; lowest insurance and highest quality work.

Box 337 Canada Lumberman,
19-22 Toronto, Ont.

WANTED—A number of responsible mill men to contract for birch and maple for 1912 delivery. Either water or rail shipment. Apply Box 240, Canada Lumberman, Toronto, Ont. 20-23

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address, Box 332 Canada Lumberman, Toronto, Ont. 19-22

For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.
11 M. ft. 1¼ in. good basswood short, 2 to 5 feet.
14 M. ft. 2 in. good basswood short, 2 to 5 feet.
50 M. ft. 1 in. M. C. Ash.
50 M. ft. 2 in. M. C. Ash.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale

Saw mill of 10 to 15 M. feet daily capacity, complete with planer and matcher combined, also lath machinery, with 400 acres of timber situated at Dillon Port, with a home market in the midst of a growing tourist section, which is just in its infancy. The P. S. L. Co. is offering for sale several berths of pine most convenient to this mill. For particulars write to Jacob Miller, Bright, Ont. 17-20

FOR SALE

Saw mill, capacity fifteen M. ft. per day. Two thousand acres timber, consisting of hemlock and hardwood. Mill limits located on Mary Lake, Ont. Timber scowed to Huntsville, G.T.R. Considerable timber to be bought. Reason for selling, the executors are winding up estate of the late W. Parker. For further particulars apply to F. H. & E. F. Parker, Parkersville, Ont. 20-23

Mill and Timber For Sale

1,100 acres, well timbered with birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 18-21

MISCELLANEOUS

For Sale

300 acres first class hardwood timber, easily logged, 2½ miles from Emsdale Station G. T. R. Good roads. For further information address Box 22, Emsdale, Ont. 20-20

For Sale

Several large timber tracts, pulpwood, yellow pine and hardwoods. Well located in the United States and Canada. Ask for particulars. S. A. Kean & Co., 5 N. La Salle street, Chicago, Ill. 20-20

WANTED—Block of first-class timber land (soft wood preferred) that can be operated at a reasonable cost, price not over $15,000. Principals only need reply; give fullest details in first instance; enclose map if possible. Box 326, Canada Lumberman. 18-21

For Sale—Valuable Timber Limits

Containing about 115,000,000 ft. of spruce and pine; good driving on the Highwood river and Sheep river to the yards at High River and Okotoks, which comprise 315 acres of valuable land, two mills in good condition, with daily capacity of ninety thousand feet. Complete logging and lumbering outfit, 40 horses, etc. Apply

Lineham Lumber Company, Ltd.,
17-20 **Okotoks, Alberta.**

WANTED — Block of hardwood lands within reasonable distance from transportation, give full details with map and lowest cash price.
Box 325, Canada Lumberman.
18-20

Broken Driving Belts

"Ignoramus" writes : "I have recently taken over a mill, and have been much troubled with the constant breaking of some of the leather driving belts, although they appear to be of good quality. Can any of your experienced readers suggest a probable reason for this?"

If, as you say, the belts are of good quality and properly tanned, stretched, and jointed, the breakages may probably arise from one of the following causes: (1) From constant overstrain, the belts being of insufficient width or thickness to easily transmit the power; (2) running at short centres; (3) allowing the belts to get hard and out of condition; but a very fruitful cause is (4) the use of pulleys of too small a diameter or width, or belts of too great a thickness for the diameter of the pulley. The question of the proper proportion of pulleys and width and thickness of belts suitable to them is a highly important factor in the economical transmission of power, and is one that usually does not by any means receive the attention it deserves, considerable loss consequently arising. If your belts that constantly break run over small pulleys we should recommend you to have the pulleys proportionately increased in size, and it is very probable your trouble will cease. — Timber Trades Journal.

Will the price of print paper be lowered in the near future by the substitution of jack pine for spruce as a result of experimental work at the United States Government station recently opened at Wausau?

The question cannot at this time be officially answered in the affirmative, but there is a report in circulation that discoveries have been made at the experimental station at Wausau, Wis., that will lead to the early adoption of jack pine in the manufacture of pulp for print paper. The report says that print paper is now being made at Wausau from jack pine, but that the product does not as yet combine the tensile strength that would warrant giving out the details of its manufacture, and until this is acquired nothing will be officially given out by those in charge of the Wausau plant.

It is said that the product manufactured from jack pine pulp lacks only a little of the tensile strength to carry it through the big presses of metropolitan newspapers. It is reported that absolutely no difficulty has been experienced in getting the proper color, the only thing left to be accomplished being the getting of the proper strength of the sheet so that it will stand the pull of the big presses. It is said that the percentage of hemlock used with jack pine is larger than it is when spruce is used for the manufacture of pulp.

Uses of Wooden Poles

The total number of wooden poles purchased by pole consumers in the United States in 1909 was 3,738,740, which is the largest total ever reported. The gain over the number reported for 1908 was 489,586, or 15.1 per cent.; and over that for 1907, 455,472, or 13.9 per cent. For the poles purchased in 1909 the sum of £1,414,765 was paid, which, although greater by £381,666 than the expenditure reported in 1908, was less by £335,980 than that in 1907, when the average cost of poles was greater than in other years. In 1909 the leading kinds of wood were cedar, chestnut, oak, and pine, and poles made of these species formed 92.7 per cent. of the total number purchased, and represented 95 per cent. of the total cost. As in previous years, cedar and chestnut were most important, supplying, respectively, 65.3 per cent. and 16.3 per cent. of all poles purchased in 1909. For cedar poles a steady increase is shown, but the number of chestnut poles purchased in 1909, though greater than the number in 1908, was less than that in 1907.—Pulp Wood Supplies.

Increasing efficiency by reducing the number of motions required to do a certain task is a theory receiving the attention of economists to-day. It is said that a student of bricklaying discovered that the average bricklayer uses eighteen movements in picking up and laying a brick, and he was able to eliminate something over half of these motions by careful attention to it. It is possible that in wood-working we may be able to do something of the same thing. Anyway, it will be an interesting subject to experiment with. That is, take the idea of making an analytical study of the different movements involved in picking up and working a piece of timber, with a view to seeing whether or not it is possible to eliminate part of it. It is a line of study that, of course, has its limitations, but it promises to be interesting and to offer some opportunities for improvement in efficiency.

The actual horse power of an engine can only be ascertained with absolute accuracy by means of a brake. A very useful guide, however, is obtained from calculating the indicated horsepower, which may be done as follows: Multiply the area of the piston by the average steam pressure upon the piston throughout the stroke and by the length of the stroke in inches, which gives the number of inch-pounds received by the piston from the steam during one stroke, but as there are two piston strokes to one revolution of the engine, we multiply by two. By multiplying this by the number of revolutions the engine makes in a minute we get the number of inch-pounds of power received by the piston in a minute. By dividing this by 12 we get the number of foot-pounds the piston receives per minute, and dividing this by 33,000 we get the horse power of the engine. The result will give the indicated horse power, and from this must be deducted the amount of power required to overcome the friction of the working parts of the engine, and the result will be (approximately) the actual power given out.

No hard and fast rule can be made as regards the speed of deal frame saws, as much will depend on the size and weight of the moving parts and the general construction of the machines, says the Timber Trades Journal. For instance, a machine with a light equilibrium or counterbalanced swing frame can usually be safely run at a higher speed than an ordinary swing frame. The speed of the saws may be anything from, say, 800 ft. to 1,200 ft. per minute.

Review of Current Trade Conditions

Ontario

So far as the actual amount of trade in Ontario is concerned there is practically no feature to mention. Orders are coming in at about the regular rate and there is a fair demand well spread over the various varieties and grades of lumber. There is however one feature which is causing disappointment and that is the scarcity of labor at the mills. A traveller who recently covered the Georgian Bay district reports that the situation is very bad, and that it is next to impossible to get cars loaded. "I don't think I ever saw it worse," said a prominent manufacturer."We have to beg of the men to come and help us get our cars out. Everyone is in the same position and we are afraid to take orders because there are so many that we cannot fill."

Stocks at Georgian Bay points are still large. Along the North Shore they are especially heavy. One manufacturer states that not more than 50 per cent. of the stocks which have been manufactured along the North Shore this year have yet been turned over. Trade in the United States where most of the North Shore cut is sold has been poor most of the year. Reports from Michigan points are to the effect that although there has been no important improvements in trade, conditions at present are about normal. Orders are reported to be filtering in at about the ordinary rate.

The trade at Ontario consuming points is about steady and fairly satisfactory. Shingles continue quiet. Prices generally are unchanged.

Reports from Ottawa are to the effect that the local trade has seldom been better than at present. There is a fairly active trade also with Great Britain, but the demand from the United States is still of a very dull nature. The trade with South America continues good.

The shortage of cars on account of the movement of wheat is, as usual at this tme of year, proving a serious handicap to the lumber trade. The labor situation is also a cause of much inconvenience to the industry as it is difficult to secure enough men for the shanties. It is hoped however, that as soon as the harvesters commence to return from the west there will be an improvement in the situation. Labor at the mills is also scarce and some of the mills will close down a little earlier this year than usual as a result. Prices in all lines are strong and unchanged.

Eastern Canada

The improved condition which has been noted in the Montreal lumber trade of late, continues unabated and gives promise of lasting for some time to come. In nearly every department good business is reported and prices generally have a stiffening tendency. The local demand at Montreal is greatly assisted by the strong building demand, caused by the large influx of population. Mills are experiencing a heavy demand for immediate shipment. Hardwood prices are well maintained and the demand is strong. As in other places there is a shortage of cars at Montreal. The trade in dimension stock is rather uncertain as a result, it is said, of doubt whether the new government will be as extensive a consumer for the erection of public buildings. The demand from Great Britain continues good and wide. The rush to complete shipments before the close of navigation is causing a great congestion at the wharves. This trouble has been aggravated by the recent railway strikes in Great Britain which caused a cessation of shipments from Canada for a time.

At New York the demand for eastern spruce is quiet, and rather unsatisfactory. An improvement however, is expected in the near future. All classes of hardwood are doing well, at New York, so far as the demand is concerned, although the prices show a small falling off, during the past month. At Boston the market for spruce frames is weaker at $23.50, as the outside price. There is so little demand that already rumors of $23.25 are frequent. Random lengths are dull. There is a slight improvement in the demand for shingles, at Boston, and the price of white cedar extras shows a tendency towards improving. Many manufacturers are holding out for $3.50. The lath situation is rather uncertain. Some of the mills are asking as high as $4.25 for 1⅝ inch. Retailers however, are sticking at $4.10, or $4.15, at the outside, while some of them state that they can buy at $4.00.

Great Britain

A slight improvement is reported in the spot demand, at London. Deliveries from the docks and yards are a little more encouraging, but there is still considerable leeway to be made up, if the figures for the present year are to equal those of last year, which in themselves were not very satisfactory. At Foy, Morgan and Company's recent softwood sale, Canadian spruce deals and battens sold at rather indifferent prices.

There is practically nothing new to report from the Liverpool timber markets. Trade in general is unaltered. The forwarding agencies are doing all in their power to relieve the congestion of traffic, and have been fairly sucessful. In the market itself the movement of lumber is a little more extensive. It is believed that there is in fact a general tendency towards improvement, though it is expected that the return to normal conditions will be slow. Spot values for spruce deals, etc., are not changed to any important extent. The demand continues rather fitful with no indication of decided improvement. Consumers are purchasing only for immediate needs, and cannot be pursuaded to enlarge their stocks, even by slight price reductions. No change is to be reported in the c.i.f. market, so far as values are concerned. Future shipments are quiet, most of the importers confining their speculations within narrow bounds.

At Bristol the imports of timber are still made up entirely of sundry parcels, per liners, for various consignees. There is a steady increase in the liner traffic. Riga vessels are bringing in increased quantities of timber, and these shipments are expected to continue increasing in favor. Importers expect this factor to have "a chastening effect on the Canadian spruce shippers, in the matter of price."

The Manchester timber markets show no noticeable alteration. Leading firms report a normal and steady demand along with a fairly satisfactory trade. No changes are to be noted in prices. The market is steady, and firm, for practically every description of wood goods, which is considered rather surprising, in view of the abnormal stocks in a few lines.

United States

Within recent weeks there has been a small increase in the demand for lumber throughout the United States, as a result of the opening up of the fall trade. In spite of this however, business at present in force is not by any means up to the usual Fall average. Markets are characterized largely by a "spotty" demand. Buying continues to be only in small orders, for quick delivery, indicating short and broken stock in many parts of the country. Dealers and consumers appear to be avoiding any danger of overstocking so long as there is any doubt about the market developing for the future. Labor troubles and car shortage are affecting the market to some extent and make it unlikely that any important decline in prices will occurr. Manufacturers in fact are inclined to hold out firmly for the present range of prices. In view of this it would seem to be the part of wisdom, for manufacturers to lay in sufficient stock at least to carry them through the fall and early winter. There is no indication however, of their doing so.

Chicago:—Building operations have increased considerably in volume, and have resulted in a largely increased movement of lumber. Prices nevertheless continue unsatisfactory, although they have not declined. With a continuance of the present demand, prices are likely to stiffen. In northern pine there is an indication that the volume of business will increase from now on. A few good orders are coming in from the country yards, and trade seems to be expanding gradually. The movement of upper grades is active at steady prices, and the lower grades also are fairly active. The box trade in northern pine is increasing, and there is a fair business in progress in sash, doors, siding, etc. The demand for hardwoods has improved slightly, although buying is not extensive. The increased activity is expected to continue, as manufacturing interests are coming upon the market.

Plain oak is in the lead, but quartered oak is in rather less demand. A fairly active trade is noted in unselected birch, as well as in 1sts and 2nds, in red birch. The trade in basswood is dull. The demand for hemlock is not quite so good. Fir is about steady. A steady demand continues for spruce yard stock. A fair volume of trade is reported in southern pine, although the trade is still rather unsatisfactory. Red cedar shingles continue unsteady. Clears and stars are not fluctuating much. The yard trade in red cedars is light. A fair demand exists for white cedars. Lath are active and unchanged.

Buffalo:—The trade in northern pine at Buffalo is fairly good, for this time of year, and has been improved somewhat by the settlement of the planing mill strike, also by an increased amout of dwelling house construction. There is a scarcity of the upper grades, and they are bringing fair prices. Building lumber is about steady. The box factories are busy, and prices of box lumber are about steady. The hardwood trade shows some improvement. Orders are fairly numerous, though not large. Prices are about steady.

Wire, Telephone or Write

Cleveland-Sarnia Sawmills Co., Limited
SARNIA ONTARIO

Plain oak, chestnut, maple and birch are quite firm. There is a fair trade in hemlock, at unaltered prices, local traders being in the market for an increased amount of lumber. Stocks are fairly plentiful, and receipts have been sufficient. There is a fair trade in low grade stock. Spruce continues quiet. Longleaf pine is steady, and in fair demand. Retail stocks are reported low, and many orders are received for immediate shipment. Shortleaf pine is in fair demand, especially on Nos. 3 and 4 flooring. Prices will probably remain firm. Red cedar shingles are very low. There is a fair demand at these prices, but no indication of advance. Receipts by lake have been plentiful. At North Tonawanda the trade in northern pine continues to improve. Shipments by canal and rail are increasing, and there is a tendency towards advanced prices. Prices for high grade stock show an indication of stiffening, and the demand is good.

Market Correspondence

Ottawa Trade Active—Scarcity of Shantymen

Ottawa, Oct. 6.—The lumber business in the Ottawa Valley remains very much the same as before the elections. The local trade has seldom, if ever, been better. The British trade is fairly good, but the American trade is still off. The depression across the line has resulted in very little buying by American dealers. There is practically no change in prices. The trade with South America is good.

Some difficulty has been experienced in getting cars. Most of the lumber to South America is shipped in bond through the United States. Most of the Canadian cars are engaged in carrying the wheat from the west. While it is reported that there are plenty of cars idle in the United States, the American companies do not seem anxious to send them to Canada, chiefly on account of the delays in loading. Very little lumber is shipped to South America by boat from Montreal or Quebec. At one time a fair quantity was shipped this way, the boats returning with cargoes of sugar. Since this trade has died out, the lumber trade via Montreal to South American countries has for the most part disappeared.

The lumbermen are experiencing great difficulty getting men for the shanties. Practically all the big firms are after more men and cannot secure them. Prices range from $28 to $32 a month, but in the competition to get more lumber-jacks, several gangs have been engaged at as high as $35 a month. The reason for the scarcity is the fact that few farmers' sons are going to the woods. Whether it is due to heavy crops in the Ottawa Valley necessitating them to stay on the farms later than usual, or that they are giving up lumbering as a winter occupation, the employment agents do not know. However as soon as the harvesters return from the North-west men will be more plentiful, as a great many of these at once engage for the shanties as soon as they return.

There is the same scarcity in help at the mills. The Fraser Lumber Company will close its mills at the Deschenes about October 15th which is earlier than usual. This is because of lack of help. For some time it has only been running about half capacity on account of this lack, and it is too expensive an operation so that the mill will be closed down early. The cut for the Fraser Company will accordingly not be as large this year as last.

The recent rains have raised the water in the Ottawa river somewhat. The mill owners at the Chaudier had to run half capacity for a long time as the result of low water. Low water in the autumn coming for two seasons in succession has given J. R. Booth a large surplus of logs that it will be impossible to cut before the winter. For this reason the operations in the woods this winter by this firm will be curtailed by about one-third in order that the mill operations may catch up next summer.

The Fraser Company which operated on the Petawawa river last winter will not cut any logs this winter. The other firms however expect to cut as much in the woods this winter as ever. They are pleased at the curtailment on the part of J. R. Booth as last summer there were so many logs in the Ottawa, that the sorting booms were scarcely able to handle all. This coupled with a great deal of head winds caused several mills to be short of logs on frequent occasions. However, with the curtailment this winter, this condition will be improved.

The Jas MacLaren Company of Buckingham has awarded a contract to Haney, Quinlan & Robertson of Montreal to build a concrete dam across the Tievre river above High Falls, 24 miles from Buckingham.

The dam will be 900 feet long and in places 40 feet high. There will be a log chute 300 feet long and from 6 to 10 feet wide; also of concrete. J. B. McRae is the engineer. The dam will be utilized at first for logging purposes and later for power development. It will cost about $200,000.

Cheerful News from Montreal Trade

Montreal, Oct. 7.—Almost without exception, dealers, wholesale and retail, are in a cheerful frame of mind. Business is very good in practically all departments, prices are strengthening, and everyone is looking for a continuance of brisk times.

The local market is again firm, with a large amount of business moving. This applies to all descriptions, owing principally to the building boom which has prevailed for many months and is likely to continue, for, on account of the large influx of population, houses in particular are in big request. There is a heavy demand on mills for immediate shipment. Hardwoods are still a good market with quotations maintained.

Dealers report a much improved trade on United States account, especially for spruce and hemlock, and the stiffening of prices is reflected in the Montreal market. There is the usual fall rush for shipment to New York from the St. Lawrence, in order to get the stuff away before the State Canals are closed on November 30. The Campbell-McLaurin Lumber Company are loading many boats of spruce for New York City.

There is a general complaint of shortage of cars, owing to the requirements of the West for shipping grain. The shortage affects the local markets as well as transactions for the United States, and naturally handicaps dealers in doing business. The C. P. R. has refused to allow the use of their ordinary cars for conveying lumber to U. S. points, and firms who want to ship goods to those points can only avail themselves of "foreign" cars.

The election has upset the business of houses dealing in dimension stock. Owing to the uncertainty as to whether the new Government will continue the policy of their predecessors in the matter of large public works, contractors naturally decline to commit themselves to any substantial expenditures. No doubt this condition of affairs will right itself, but in the meantime there is a slackness in this branch of the lumber trade.

One dealer expresses the opinion that prices of lath are bound to go appreciably higher, basing his view on the ground that owing to the Upper Ottawa Valley not getting its supply of logs the cut of lumber and lath will only be 60 per cent. of the normal.

Mechanical wood pulp is very high, prices being at top-notch for any pulp that can be shipped for the remainder of the year. There is no such thing as lots for immediate shipment, the mills having sold their present production. In newspaper descriptions all the big mills are sold up for sometime ahead, and newspaper is scarcer in Canada than it has been for a year past. The chemical pulp wood market is also very much better; the six weeks' lock-out among the Norwegian mills has shortened the supply from Europe to the United States, and Canadian mills have consequently been shipping there in larger quantities and at good prices.

There is a very fair demand for the British market, and prices keep steady. As is usual at this time of the year, the wharves are congested, owing to rush to ship lumber before navigation closes, and also in part to the tie-up which resulted from the recent strikes in England. The difficulty, too, is increased by the inadequate supply of cars.

The sawing of the Eagle Lumber Company, Montreal, will be completed about the 20th of October at the mill situated at Mont-Laulier, Quebec. The secretary, Mr. J. H. Poulin, states that there has been a marked improvement in business and a general rise in prices in all lines. The bulk of their material has already been disposed of for fall delivery. The company are preparing to double their capacity at the mill for next spring in view of the promising possibilities presenting themselves.

Timber Trade in the United Kingdom

Liverpool, Oct. 5.—The actual consumption of timber in the United Kingdom is the great main fact or factor of the trade to Canadian lumber manufacturers and exporters. The handling of timber at docks and yards, and by railway companies, might be at a standstill, and yet the consumption of timber be going on actively, and "trade," as far as such a consumption was concerned, be very good. To assume that such a consumption were in progress would, of course, mean a pre-supposition that stocks of timber, sufficient for present needs, were held by builders, joiners, cabinet makers, case makers and other woodworkers in the country, and that all of these users of wood were drawing on their supplies for the time being.

A stock of timber may be said to be held by every builder, joiner, cabinet-maker, case-maker and woodworker in the country. In many cases the stocks held are extensive, and are kept to their recognized compass with studious care, fresh timber being brought in to take the place of that withdrawn from drying-room or yard for use. In

most cases sufficient timber is held in stock to admit of a business being carried on for a few weeks without any fresh supplies being obtained. Obviously, therefore, consumption might go on at a rapid and satisfactory rate, at works and shops, for a time, and business at dock-yards and points of importation be at a standstill or nearly so.

It is desirable that these facts of the trade be kept in mind at the present time, otherwise erroneous views as to the consumption of timber may prevail. At the dock-yards, for a month past, business has been impeded, and things may be said to have been in disorder. At times receipts and deliveries have been suspended. Then they have been resumed and have gone on in a fitful sort of way. This irregular state of things at importers' yards has had absolutely no true relation to the state of things at builders' depots and joiners and cabinet-makers' shops in the country. It has been due to the effects of the transport workers' strikes in August. No one imagined that a stoppage of railway goods' traffic for about four days could have produced the glut and chaos in the goods departmtents of the principal companies, which business people have been contemplating for the last three weeks. Business was slowly righting itself, when another strike of transport workers, those connected with the Irish railways, was announced. This has added to the confusion caused by the English transport workers' strike, yet there is no ground for despair. Things will smoothen themselves out shortly and then timber will pass to and fro by rail freely again.

Meantime the using up of timber at works and shops has gone on steadily. The consumption of timber for general building uses is on a fairly large scale and joiners are more fully employed on this class of work. Pine and spruce deals are being used largely for building purposes and for the construction of scaffolds, derricks, stages and gangways, in constructional work of an extensive kind. The consumption of soft wood and deals in work of this class accounts for a steady movement of wood from builders' and merchants' yards.

Wagon Builders' Demand Active

Wagon building has lately made a well-sustained demand for wood of the kinds used for this work, chiefly oak planks and redwood and spruce deals. At the wagon building works of one of the principal English railway companies which I visited in September, I found a very large stock of deals, in stacks for convenient handling, which covered some acres of storage land at the works. The quantity of deals on view at this one place seemed to be enormous, but I had abundant evidence that the regular consumption of deals at these works was on a large scale. New wagons were, I learned, being made continuously, while wagons, trucks and vans came in to be repaired also, continuously. Train loads of timber, mainly deals, some coming in, some going out to other parts of the company's system, stood on rail, near the works. This wagon building branch extends much beyond the railway companies' own domains. In the United Kingdom there is a large and prosperous railway wagon building industry which is carried on by many companies and firms who make wagons and trucks, not only for the home railways, but for practically all countries possessing railways. For the last three years wagon builders have been well employed as railway companies have been increasing their stocks of wagons or replacing old ones. The consumption of wagon timber has, accordingly, gone on steadily and on a relatively larger scale in England and Scotland, and continues so at the present time.

London Demand Improving

At London business has improved, and the demands are in excess of those at the corresponding time last year. Quantities of first and second Montreal pine offered in the public sales have found ready buyers, at prices which were considered as on the easy side. Boards, planed and rough, have sold freely, and at prices which were regarded as "good." The main thing is that there has been a willingness to buy prime or sound stuff. This speaks well for the state of trade.

At Southampton more business is being done in builders' wood, the building trade having become more active. Joinery works and sawmills are well employed.

On the Tyne the demand for soft wood has improved slightly. The building trade keeps quiet, but joiners are more fully employed on general work and are using more material.

At Hull and Grimsby improved demands for spruce and yellow pine, and for oak for wagon work, are reported.

At Liverpool, business is more settled and orders from inland towns are coming in more satisfactorily. Quebec pine and spruce deals are in steady, though moderate demand. Sawn pitchpine has sold more freely, wood of good quality being most called for. Birch planks continue in demand, but prices have eased slightly.

At Manchester Quebec pine boards have been more inquired for. Spruce deals have sold steadily and on a satisfactory scale. Joiners, furniture makers and case-makers in the district round Manchester are evidently using more wood, sales being on an increased scale. What is most feared at the moment is a strike of workers in the building trade of the district, but every effort will be made to avert this new, and threatened labor trouble.

New Brunswick Cut May Be Curtailed

Fredericton, October 9th.—The lumbermen of the St. John river district are now preparing for next season's supply of logs. Many of the mill owners already have crews in the woods, and although the market at present is fairly steady, with fair prices prevailing, mill owners who hold timber limits seem inclined to curtail their cut considerably, especially those who are shipping principally to the American market. The repeal of the Pike law, which allowed logs cut on the American side of the line to be floated down the river to St. John, manufactured at the mills there and shipped back to the United States free of duty is likely to affect the St. John River cut considerably.

In view of the reciprocity agreement having been turned down on this side the line, it seems to be the general impression among mill owners that the surtax is likely to be placed on Canadian imports to the United States, and they are inclined to go carefully for the present, which, with the now rather overloaded condition of the market, may not be such a very bad scheme after all. There is a fair demand in the Boston market.

There has been a steady demand in the home market, especially in the lower grades of shingles.

The Liverpool and Manchester trade has been somewhat depressed owing to the recent strikes, though not nearly to the same extent as was the case with more perishable goods, and at present the demand is steady with usual prices prevailing.

Rafting operations on the St. John river are practically wound up for this season, for although there is several million feet of logs within the corporation limits in the vicinity of Grand Falls, with the low water which has prevailed for the past two months or more, it is practically impossible to bring it to the booms at Fredericton, and even should possible heavy rains raise the level of the river sufficiently to bring the lumber in, the season is so far advanced it is very unlikely that it could be rafted before the ice forms. It is estimated that there is in the vicinity of 20,000,000 feet B.M. of last season's cut for the St. John and Fredericton mills hung up.

Washington and Oregon Mills in Merger

The consolidation into one company of tide-water lumber mills of Oregon and Washington, controlling more than one-half the lumber output of the Pacific northwest, and its acquisition of timber lands sufficient to supply the mills for at least fifteen years, the whole representing an invested capital of approximately $200,000,000, is virtually assured in the near future, according to prominent Portland timbermen. It has been learned that mill owners representing more than fifty per cent. of the Columbia river cut have signed the agreement and have already joined the proposed merger. The project is being handled by Henry J. Pierce, of Spokane, who is representing eastern capitalists, whose identities he declines to disclose. The agreement provides that its conditions are binding only in event that 65 per cent. of the output of tidewater mills in the two states have become parties to the contract prior to January 1st, 1912, and that Pierce shall have until March 1 to organize the proposed company and take over the properties and timber holdings of the contracting lumbermen. Pierce is also bound to show that he has adequate backing to operate the mills at full capacity for fifteen years. The proposed merger will control approximately 1,560,000,000 feet.

Much discussion has been caused by the contemplated merger. Mr. Henry T. Pierce, who is promoting the company, has made the following statement regarding the proposal: "It is propsed to consolidate the Pacific coast tidewater sawmills of Washington and Oregon into one company, and to acquire sufficient timber to run the mills for fourteen to twenty years, and through reforestation for many years more. This consolidation will lift the lumber community from its present unsatisfactory condition, and place it upon a business-like basis. It will be the most practical move toward the conservation of the forests ever attempted. It will mean limiting the cutting down of the forests to the demand for lumber, and at the same time making the demand as large as possible by reaching out for new markets at home and abroad. The lumbermen of this coast will build up the finest organization of its kind in the world. It will mark the dawn of a new era in the conservation and preservation of agricultural and public interests."

A big negro and a small Italian were sawing a large timber, with a heavy cross-cut saw, each in turn pulling it back and forth. A pugilistic Irishman stopped to watch the operation. In a minute he hit the negro, saying: "Give the saw to the little fellow if he wants it."

More Power Means

More Profit

USE "AMPHIBIA" BELTS

¶ Anything making for more power or less friction is of much interest to all belt users.

¶ To get the most possible power, speed and economy from belts is a problem we have studied for thirty years, and now we produce a practically perfect belt.

¶ "Amphibia" Belts will do more than just ordinary belts and with less cost for up-keep.

There is an "Amphibia" belt for every purpose.

¶ "Amphibia" Belts are waterproof. They are not affected by steam, water, damp air or any similar adverse conditions. We guarantee them against opening of laps through exposure to water or steam.

Your Chance to Prove "Amphibia" Efficiency

¶ If you are contemplating the installation of any transmission equipment let us advise you more fully as to the efficiency of "Amphibia" Belts.

¶ Send us your enquiries. We can be of help to you. We agree that you first prove "Amphibia" merit before any cost to you.

Farnworth and Jardine's Deal

Much interest has been aroused in timber circles in the United Kingdom and especially at Liverpool, by the announcement that Messrs. Farnworth and Jardine of Liverpool have purchased the business and trade interests of Mr. Alexander Gibson of New Brunswick, for the sum of £200,000. The Liverpool firm are one of the stronger "pillars" of the timber trade at that port and have, for many years. been in intimate relationship with most members of the trade, through the regular public sales of timber which they have conducted. These sales have become an institution of the timber trade in England and there can be few, if any, members of the trade in the midland or northern countries of England who are not interested in them. The firm have long held a front rank position in the commercial arena of Liverpool. They have extensive city offices in Dale street, Liverpool, and at Seaforth, to the north of Liverpool, and store yards, sheds and salesrooms within the timber trade's main storage area in the north part of Liverpool near the great docks. The acquisition by Messrs. Farnworth and Jardine of the valuable Canadian timber business named, has been of especial interest to many members of the trade, owing to the fear of a falling off in the importation of Canadian timber to England, which has prevailed of late. That Farnworth and Jardine should have taken over the Alexander Gibson interests, has restored confidence in the Canadian trade. The prospects of the trade are good, it is said, or this old Liverpool firm, with their intimate knowledge of the trade would not, now, have acquired so large an interest in it.

Pulpwood Export from N. B., Possible Till August 1, 1912

Practically all the wood pulp and print paper produced in New Brunswick until August 1, 1912, will enter the United States free of duty. This is made possible by a revised rule made by the Acting Secretary of the U. S. Treasury, under the only operative clause of the reciprocity agreement. The surveyor-general of customs of New Brunswick advised the Treasury Department that the new law of the province restricting the exportation of pulp wood did not apply to lands operated under licenses issued or renewed prior to October 1, on which date the act becomes effective. The lands are used under long term leases, governed by yearly licenses, and August 1 is the date for renewing these licenses. Consequently until that time there will be no American import tax on pulp wood or print paper originating from those lands.

Regulations have also been issued by the Treasury Department of the United States governing the taxation of Canadian pulp wood and print paper coming partially from Crown lands and partially from private lands. American customs collectors will insist upon sworn statements showing the percentage of origin, assessing duty on products of Crown lands where the importation is restricted and entering the remainder free.

Wood-using industries in Canada reported to the Forestry Branch for 1910 the use of $542,000 worth of yellow pine and $69,500 worth of Douglas fir.

From scientific investigation and experiment it has been ascertained that our native Douglas fir could in many instances replace yellow pine as at present used in Canada. Yellow pine is necessarily all imported from the United States, and if a species of native wood could be introduced to take the place of yellow pine. the change would be of great benefit in the development of Canadian industry. Douglas fir is a lighter wood than yellow pine and has a greater limit of elasticity, that is, stands more bending without taking a permanent set. Likewise, compression perpendicular to grain is resisted equally by both species. In the western states the uses of this wood are being rapidly extended and its recently discovered qualities are introducing it for purposes for which previously only yellow pine was thought fitted. Douglas fir is a light and strong wood easily worked. For railway cars and vehicles it is used throughout the United States, where its elasticity and durability recomment it for nearly all purposes except where a hardwood has to be used. Because of its beauty of grain and the attractive effects which may be obtained by staining, it is very popular for inside panel work, door and window frames and cheap classes of furniture, particularly "mission" furniture. Furniture, car and vehicle manufacturers would benefit if Douglas fir was used to a greater extent in Canadian manufacture.

A Bay City, Mich., lumberman who imports considerable lumber from Canada said that large stocks, bought in the Georgian Bay district for the Saginaw Valley and other American markets which were held back pending the result of the reciprocity election, will go forward at once.

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps

FAVORITE
SHANTY RANGE

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

Forest Maps

The mapping of timber lands is recognized as a most important piece of work by Pulp Companies and timber land owners, in the economic handling of wild lands. We furnish topographic maps which show fifty-foot contours, or actual location of streams, ponds, lakes, roads, trails, and any other natural features of importance.

Accompanying this map is a so-called "Timber Map," showing in colors the distribution of timbers found. These maps, together with the detailed report and estimate, afford the owner of lands an intelligent system for the handling of same.

La Compagnie de Pulpe de Chicoutimi
Chicoutimi, P.Q., Canada,
August 23rd, 1911.

Gentlemen :—

Replying to your favor of August 11th, would say that we have no objection whatever to your using the name of this company with reference to the quality of your work.

After a careful examination of the maps and reports which were the result of your work on the two hundred odd square miles in question, we take pleasure in complimenting you on their accuracy, neatness and generally satisfactory character.

With best wishes for your success in the future,

Yours very truly,
GEORGE C. W. LOW,
Manager Woodlands Department

Messrs. Appleton & Sewall,
156 Fifth Avenue, New York.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts, showing character and quantity of available timber, indicating the most approved methods of cutting each year, so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

EDGINGS

Ontario

The LeBel, Turnbull Lumber Company, Sarnia, Ont., is making application for leave to surrender its charter.

The stock of the R. E. Kinsman Lumber Company, Limited, Hamilton, Ont., is advertised for sale by tender.

The John Deere Plow Company, of Moline, Ill., has decided to erect a plant at Welland, Ont. The estimated cost of the plant is $1,000,000.

R. Laidlaw & Company, Traders Bank Building, Toronto, will erect a $2,200 storage building for lumber, at 1064 Dundas street. The building will be constructed of wood and iron.

Fire, believed to have been of an incendiary origin, completely destroyed the small planing mill on the Avey, O'Laughlin Lumber Company, Brantford, Ont., recently. The loss will be about $2,000, covered by insurance.

The contract for the erection of the cooperage plant for the Imperial Oil Company at Fort William, Ont., has been awarded to Barnett and McQueen. The building is to be two storeys, frame construction, 175 x 50.

Fire, which, it is thought, may have been of incendiary origin, completely destroyed the factory of the National Casket Company at Orangeville, recently. Mr. A. J. H. Eckardt, of Toronto, president of the National Casket Company, was in Orangeville at the time. He estimates the loss at about $10,000.

The Hocken Lumber Company, Otter Lake Station, Ont., will commence next month the erection of an additional sawmill about 5 miles east of Otter Lake. The object of this extension is to meet the increasing demand of the trade for bill timber. The mill will operate the year round, and will have a capacity of from 15,000 to 20,000 feet per day.

Berth No. 119 in the district of Sudbury, lying a few miles north of Webbwood, has been sold by Mr. Edward Tait, of Orillia, to the Wolverine Cedar and Lumber Company, of Sault Ste. Marie, Mich., whose mills are located at Little Current, Ont. The berth contains thirty-six square miles, and the price paid for it was in the neighborhood of $50,000.

J. B. McArthur, of Port Arthur, Ont., has given a contract for the erection of a match factory on Norah ave. The general contractor is George Otto, Port Arthur, and the architect, J. Antonisen, Port Arthur. The building will be one storey, 160 by 160 ft., of cement brick, and steel construction, with concrete foundation, and electric lighting.

The Dominion Wood & Lumber Company, of Trout Creek, Ont., has recently been formed. The officers have not yet been definitely determined, but will probably be as follows:—President, Jacob Kaufman, Berlin, Ont.; vice-president, Edward Clark, Toronto, Ont.; secretary-treasurer, Gilbert Trussler, Trout Creek, Ont.; directors, W. S. Kelly, Bridgenorth, Ont., and W. J. Foster, Hawkestone, Ont. The object of the company is to build chemical plants, and other necessary buildings for the distillation of wood taken from limits in the neighborhood of Trout Creek, Ont. A meeting will be held in the course of a week or two, to confirm the appointment of officers. The capitalization of the company is $250,000. They hold the right to cut timber from 80 sq. miles of good forest, consisting largely of pine, and also containing a quantity of hemlock, spruce, birch and maple. The limits are heavily timbered, nothing having been cut except a portion of the pine.

The Board of Directors of the Spanish River Pulp & Paper Mills, Ltd., recently declared the half-yearly dividend of three and one-half per cent. (3½ per cent.) on the preferred stock of the company for the six months ending August 31st. The dividend will be payable October 15th. Reports submitted to the Board of Directors were of a very satisfactory character, showing, as they did, earnings for the six months, well in excess of those of the same period last year, and this, notwithstanding the fact that the company's mill was shut down for practically the whole month of April, owing to the improvements that were being carried out.

A boom at the foot of Bathurst street, Toronto, holding about 700,000 feet of squared timber, broke recently and the timbers were carried by the strong wind through the western gap and out into the lake. The Humber Bay was congested with the timbers, which are from 18 to 20 feet in length and 8 to 10 inches square. The timber was brought from Northern Ontario about two months ago for the new city docks at Ashbridge's Bay. Miller, Cummings, and Robinson, contractors for the new docks, put two tugs at work rounding up the lumber. The beach from Parkdale to Mimico was strewn with the timbers, and a patrol was maintained along the lake shore to prevent any of the material being carried away.

The Trout Creek Logging Company, Limited, with head office at Trout Creek, Ont., has been organized. The president of the company is Mr. Edward Clark of Edward Clark & Sons, Toronto, Ont. The vice-president is Mr. Jacob Kaufman, of Berlin, Ont, and the secretary-treasurer is Gilbert Trussler, of Trout Creek. The directors are W. J. Foster, Hawkestone, Ont., and W. S. Kelly, Bridgenorth, Ont. The object of the organization is to construct a siding in the limits of Trussler Bros., Ltd., and the Ballantyne Lumber Co., Ltd., for the purpose of logging by rail. The company have formed a working arrangement with the G. T. R., and are putting on their own engines. They have about 4 miles of track graded ready for the cars and rails. Two miles more will be completed this fall and they expect to have the rails on all the completed track before winter. The balance will be completed next spring. The company also intend to build a mill at Trout Creek, where their siding will join the Grand Trunk. The mill will have a capacity of 30,000 to 40,000 feet a day and will cut mixed hardwoods and softwoods.

Eastern Canada

The assets of Jos. Isabelle, lumber dealer, Armagh, Que., are reported for sale.

The McLaren Lumber Company, of Buckingham, Que., lost their mill at Lake Nominingue, Que., on October 4, by fire. The loss is placed at

$30,000. It is reported that they intend to rebuild. They will require hydraulic turbines, dynamos, steam power plants, saws, planers, hose, etc.

R. H. Scougall, May Island, Que., sawmill operator, is reported to have assigned.

Durocher & Company, Iberville, Que., have been registered to conduct a sash and door factory.

N. Roy and Freres, sawmill operators, Beauce Junction, Que., are reported to have assigned to J. P. E. Gagnon, prov. guardian.

The Bellerive Lumber Company, Limited, Montreal, Que., has been incorporated, with a capital of $50,000. The incorporators are L. Morin, John Kennedy and John Wilson, Jr., of Montreal.

The Standard Box Factory at Lennoxville, Que., was destroyed by fire recently. The building was totally destroyed, in addition to a large quantity of machinery and lumber. The loss is estimated at over $20,000, and the insurance was only about $5,000.

The West Valley Land Company, Limited, Montreal, Que., has been incorporated with a capital of $70,000, to carry on a real estate business and sell and deal in timber limits, lumber, etc. The incorporators include E. R. Decary, J. B. Peloquinan and E. N. Herbert, all of Montreal.

The sawmill belonging to Geo. Letts and Sons, Campbell's Bay, Que., was burned to the ground recently. The fire had gained considerable headway before being noticed, but by hard work by the bucket brigade quickly formed the lumber in the surrounding mill was saved. The loss is about $6,000, with no insurance.

Blackadar's lumber mills near Weymouth, were destroyed by fire on October 4th, with a large quantity of lumber. The loss is estimated at $25,000. The mills were insured for $4,000. The Sissibo Lumber Company had $13,000 insurance on lumber and Blanchard & Company $1,500. A small portion of the lumber was saved.

An English syndicate in which John C. Mahon, Halifax, N.S., and P. J. A. Lear, Hotel Great Central, London, Eng., are interested, will erect a sawmill at Lake Ainslie, N.S. The mill will be commenced in about six weeks. They also intend to sink a large oil well to be in operation early in the spring, and to build a railway from Lake Ainslie to Orangedale.

James MacLaren & Company, Limited, of Buckingham, Que., have given to Haney-Quinlan and Robertson, of Montreal, the contract for the construction of a concrete dam at High Falls, Que., on the Lievre River. The dam is to be part of an electrical power development and will cost $200.000. Mr. J. B. McRea, of Ottawa, is the engineer in charge of the work.

The Bayless Pulp and Paper Company, whose dam wrecked the village of Austin, Pa., causing great loss of life and property, will transfer its plant from the Pennsylvania town to Canada, where the corporation has recently purchased a large tract of timber lands, according to a statement made by the company officials. The move was contemplated before the recent disaster, because of the elimination of Pennsylvania forests and a scarcity of wood pulp material. It was expected that the transfer would be made within the next five years, but the disaster has hastened the removal plans.

The long-talked-of by-law for the prohibition of the piling of lumber within the town limits, was presented and given its first reading at the meeting of the Aylmer town council recently. The measure was left on the table and will probably pass without the necessity of putting it to a vote at the next meeting of the council. Mr. T. Ritchie was present at the meetings and signified his willingness to remove his lumber piles, which are on the site of the recent conflagration which jeopardized the safety of the town, as soon as he can complete arrangements with the C. P. R. for the removal of the lumber. Mr. Ritchie will pile his cut on his farm situated opposite Fraser's mills, where there will be no danger to other property should a fire occur.

The sawmill of the Riordon Paper Company, Limited, at Calumet, P.Q., which was destroyed by fire on July 12th, is being rebuilt. The foundations are now about complete. The mill building will be all steel, sheathed in concrete, roofed and sheeted with corrugated galvanized iron.

The boiler house and engine room will be of brick with steel trussed roof. The boiler house will be roofed with corrugated galvanized iron and the engine room with wood covered with gravel roofing. There will be three return tubular boilers with a total capacity of about 500 horse power. The mill will contain a double cutting band saw with the necessary live rolls, edger, butting table, etc., and also shingle and clapboard machinery. The yard will be equipped with tracks. The steelwork and brickwork will be finished by the end of this month and the entire mill will be closed in by the middle of November and will be ready for operation next spring. The capacity will be about 100,000 feet per day.

Western Canada

The Globe Lumber Company, Limited, has been registered under the Foreign Companies Act in the province of Saskatchewan.

The Crown Lumber Company, Calgary, Alta., will erect a building costing $5,000. The building is to be 32 ft. x 125 ft. The company are in the market for mill machinery.

The Pincher Creek Mill and Elevator Company, Limited, Pincher Creek, Alta., has been incorporated with a capital of $100,000, to erect and own elevators, mills, etc., and deal in lumber and other building materials. The provincial office is at Fernie, B.C. Sherwood Herchmer, solicitor, is attorney.

The McLelan Lumber Company, 744 Hastings street west, Vancouver, are erecting a sawmill of 50,000 feet capacity, at Ladner, B.C. The mill is to be 250 x 60 feet. The specifications include a 60-foot inclined carriage, Pacific coast band saw, 21 trimmer saws, conveyor apparatus, blower, two 20 x 24 twin engines, 108 x 44 fly wheel to make 160 r.p.m., four boilers, Pacific coast five-saw edger, two grinders, one stretcher, brazing table, filing clamp, etc. Tenders are to be called for at once. The architect is Mr. E. F. Mitchell, of Seattle, Wash.

The recently organized British Canadian Lumber Company, has acquired a 50-acre site on Lulu Island for $200,000, the vendors being Joseph Crane, A. DesBrisay and A. Barnet, of Renfrew. Improvements to the property, including the sawmill, will represent an investment of half a million dollars. Work will be commenced at once and the mill is expected to be ready by spring. A box factory will be a feature. The company has 3,500 feet of water frontage.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

WE will make especially low prices on the following Dry Stock for immediate shipment:

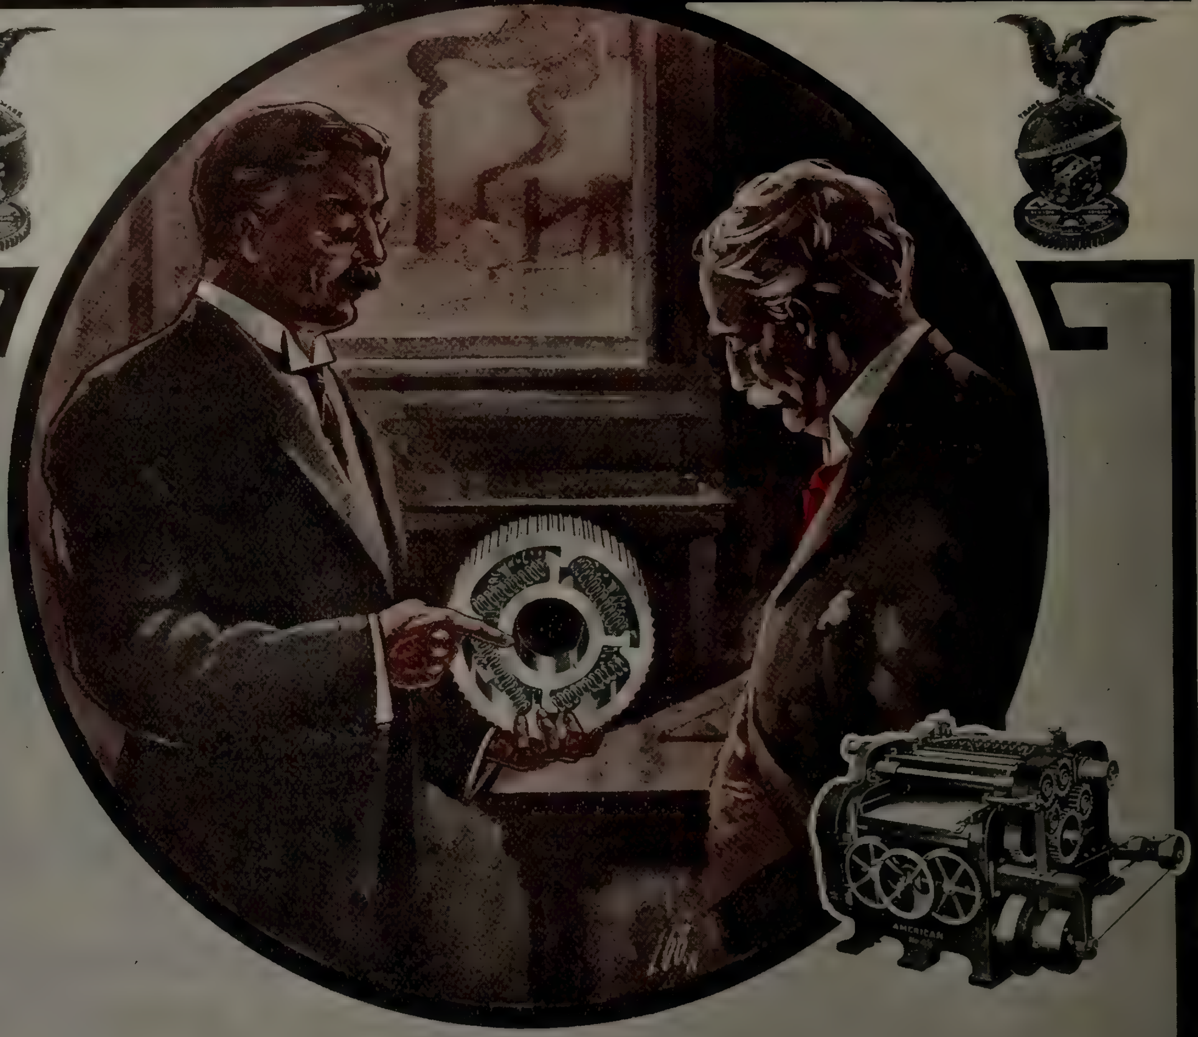
AMERICAN
FIRST IN QUALITY



A Sectional Roll may be either a nuisance or a fine thing.
The "*American*" Sectional Roll can cause you no trouble. Let us tell you why.

Incidentally, no other Sectional Roll has ***eight springs*** to the section—can you read the value of that? Of course you can, especially so, if you've ever had any experience with four spring Sectional Rolls.

Do you want a Planer, single or double? Buy only the ***best***—an "***American.***"

We have been asked:
"Are you interested in the carpenters and the Disston Saws they buy, even after you have their money?"

THIS is a question easily answered. Do you suppose for an instant that we could have retained our regular trade, constantly increasing it, built up and maintained the largest and greatest works of its kind in the world, over a period of seventy-one years, had we not seen to it that the articles we sent out were "making good" and satisfying the user?

LARGEST PLANT IN THE WORLD

We want to force home to you the important fact that our plant is by far the largest of its kind in the world, consisting of 58 buildings, covering 50 acres. We employ 3500 men, and during almost three-quarters of a century—the period we have been in business—very little time has been lost by the employees. You must realise that it requires "some orders" to keep an establishment of this magnitude going.

There surely must be more than ordinary merit in that brand of goods which creates and satisfies the demand over a long period of time.

PROTECTS THE USER

We certainly do want to know if any DISSTON BRAND SAW, TOOL OR FILE does not stand up to our guarantee. That guarantee is sufficiently broad to protect the user on every reasonable point. If you have a Disston Saw, Tool or File that has failed you through any cause of ours, let us know, and we will see that you bear no loss on our account.

Each and every article bearing the name DISSTON carries a full warranty as to material and workmanship.

And this guarantee has been in force since the first Disston Saw was made.

There are millions and millions of DISSTON BRAND SAWS, TOOLS and FILES in practical use all over the world, which are giving the highest satisfaction. Of course, you will appreciate that almost every individual has his own ideas and opinions and it is impossible to cater to each, particular in cases where they may be prejudice; so our only recourse is to satisfy the majority, and this we have been doing for over seventy-one years—making the goods of superior quality and after designs which have been demonstrated by practical use to be best adapted for the purpose.

It is noteworthy, however, that where we have one complaint, we receive thousands of letters voluntarily testifying to the superior worth and durability of DISSTON BRAND GOODS. This speaks for itself.

Neverless, we are always open to conviction, and if a man has complaint to make about any of the Disston Goods, it is but fair and just to us that he enter the complaint; for it is by considering, fully digesting and going into the cause of the trouble, in addition to our constant experimenting and investigations which enables us to so improve and perfect DISSTON GOODS as to bring them up to the highest point of efficiency. When a man has occasion to find fault with any of our goods we do not consider it "a complaint," but a stimulation and a reason for increased vigilance in looking to the safeguarding of the high prestige we have achieved for the name DISSTON.

MOST PRACTICAL EXPERIENCE

We have the experience—and broad experience at that—extentending over seventy-one years, not only in the making but in the using of tools. Think of the enormous size of our plant; think of its many diversified departments and their ramifications—Steel making, Saw making, the making of various Tools. File making, Wood working departments, Machine Knife making, Machine Shop. Think of the enormous quantities of tools and materials we buy from the outside and think of the great quantity of tools of our own make that we use. When you consider all these points, it will give you some idea of our experience in the manufacturing and use of tools. And that experience we make COUNT in the perfecting of our manufacturing facilities and the increased efficiency of our own brand of goods.

MADE FOR EFFICIENCY

In the DISSTON BRAND Saws, Tools and Files you have the advantages of the product of a progressive, up-to-date factory, the LARGEST IN THE WORLD. Where the goods are made throughout, from the making of the steel itself—the superiority of which has been demonstrated for the past fifty-six years—to the finishing operation; and each process is performed by mechanics of long experience and highest order of skill.

We want to say to you, and say it positively, that DISSTON GOODS are made not merely to sell, **but for practical use.** All materials used are of highest grade; the steel is properly hardened, tempered, and ground under the Disston exclusive processes; each article carefully inspected at various stages of the work, and finished in a workmanlike manner. **We Fully Guarantee them to be of Highest Efficiency and Unequalled.**

WE ARE INTERESTED

Reverting to the question:—Yes, we are interested in the carpenters and all other users of our tools, as well as the tools themselves after they have been bought and put to use. For we take great pride in the successful results they have achieved in the working, and fully realise—have realized for years—that the world-wide reputation we have earned can only be maintained by furnishing goods of the highest efficiency.

POSITIVE

Combination Split Wood Rim Steel Arm Malleable Hub Pulley

RAISING THE DUST

You know how disagreeable it is, how unhealthy it is, how it reduces the productive efficiency of employees in hazy and choky atmospheres where dust is being raised, and so costs you money.

Among the many advantages of POSITIVE Combination Pulleys is the fact that the narrow of the arms cuts the plane of rotation, thereby obviating fanning. In fact, the arms are totally invisible while running.

In your wood working shops, pattern shops and other dusty places, it means economy to use POSITIVE Pulleys, because they are built to avoid Raising the Dust.

OILDAG

(REGISTERED TRADE MAKR)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E.E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

Write for Oildag booklet 77 E.

A New Automatic Double Cut-Off Saw with Hopper Feed

The **capacity** of this machine is practically **unlimited.** It will cut off both ends as fast as your operator can throw the stock by the arm-full into the hopper and the off-bearer carry it away.

A large factory cannot afford to be without a No. 291. It will **take the place of at least three** of the old style machines, and do better work.

The small shop too, will find it **a paying investment.**

No matter what kind of a double cut-off saw you are now using, **you will eventually buy a No. 291,** because—

It's the strongest and most simple in construction —**built like a machine tool throughout**—no chance for a breakdown.

It's the only **absolutely accurate** double cut-off saw made. The dogs that move the stock along the slides are screwed into a chain made of milled steel blocks, and each dog has separate **micrometer adjustment.**

The **saws** are **enclosed,** forcing the sawdust directly into chutes which are connected to the exhaust pipes.

The rack and pinion arrangement for changing to different lengths is **more accurate** and **twelve times as fast** as any other.

Countershaft is bolted on the rear of the frame, to give good belt length, insuring **greater driving power and minimum belt wear**—and belts are expensive.

Every **adjustment** is made **easily** and **rapidly.**

**You owe it to your business to investigate this new tool.
Write for details and price—it don't obligate you to buy.**

Owners-Millmen-Filers

THORNTON CLANEY LUMBER CO

read our "BERLIN QUALITY" monthly

BULLETIN OF IMPROVEMENTS ISSUED MONTHLY BY THE BERLIN MACHINE WORKS.

Not a trade-paper, but a monthly bulletin of improvements made by this company in the wood-working field.

This little publication is being read by the most progressive owners, mill-men and practical men in all parts of the country.

The July paper contains articles by practical superintendents and operators on subjects of vital importance in the handling of machinery with announcements of new machines and new devices by the company.

This little paper is being read widely because it deals solely with the manufacturing side of wood-working and contains articles of intense interest to the mill man who is looked to for results.

A few of the articles in the July issue are as follows:

1. Article on "Band Saw Benchwork,"—C. Hapsburg Liebe.
2. Sanders and the right sandpaper—an article on the right sandpaper for different sanding.
3. The use of the Profiling Attachment—By Chas. Platt.
4. Successful use of thin knives—By Fred Cantin.
5. Resawing hardwood with the Horizontal Resaw—By W. B. Thompson.
6. New Hardwood flooring heads.
7. Development of the fast-feed flooring machine.
8. Slab Resaws and their uses.
9. Motor driven wood-working machinery.
10. Cutting ends automatically in the furniture factory.

A copy of this particular issue will be mailed FREE, to any millman, superintendent, foreman, operator or filer. In writing, state where you are employed. We aim to work with the practical millman by keeping him in touch with the improvements we are constantly making.

"BERLIN QUALITY" Should be Read by Every Man in every Plant.

INDUSTRIAL LOCOMOTIVES

The value of a locomotive lies in the length of the service and the proportion of time it is ready for use, as well as the work it will perform. We give as much attention to the building of our small locomotives for logging service as we give to our largest and most powerful engines.

Locomotives in this service usually operate away from shops or repair facilities. It is most important that they should be simple and sturdy.

Our engineers are specialists in this class of work with the widest and most varied experience in locomotive design. They have applied this experience in designing our small locomotives.

Our pamphlet No. 10040 illustrates our standard designs. Write for a copy.

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.

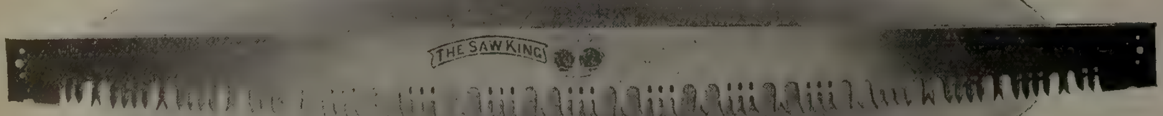
"SAW KING" Cross-Cut Saws

THE SAW KING

"SAW KING" specially adapted for British Columbia



"NARROW SAW KING" has no superior for small timber or a falling Saw

Leading Lumber Manufacturers throughout Canada are continually sounding the praises of the "SAW KING" Cross-Cuts.

No Cross-Cut Saws ever placed on the Canadian Market have enjoyed such widespread popularity.

Tempered by our new improved process, they have a Keener Cutting edge than any other Cross-Cut saws made and in addition they possess many exclusive advantages. Every saw warranted.

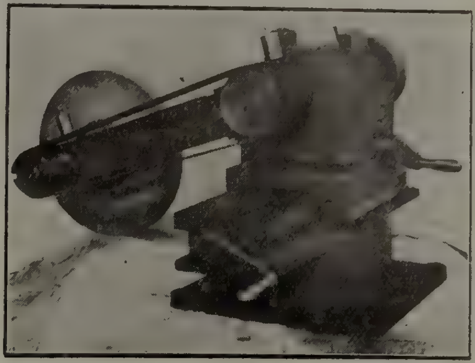
The "Midland" Band Wheel Grinder



After this machine has been attached to the Frame of the mill it can be adjusted and put to work in twenty minutes.

One Setting Grinds Both Wheels.

The whole operation done before you can get enough timbers together to rig up any of the Grinders now on the market. Every Sawmill man knows that Band Wheels should be ground oftener than they are, but with the heretofore existing appliances this operation meant a shut-down for two or three days. With **THE MIDLAND** you can grind up at any time, and by keeping your wheels in shape make and save money.

Further particulars on request.

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

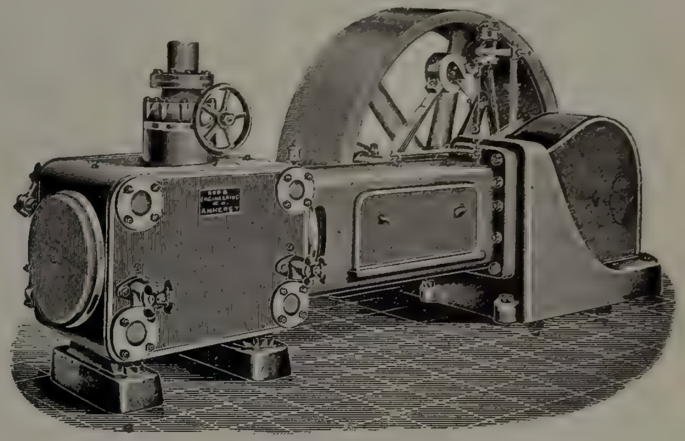
Robb-Armstrong Corliss Engines for Factories and Mills

Continuous service with the least possible attention is secured by the positive valve gear and moderate piston speed.

Freedom from vibration is a result of a short stroke and compact frame.



Low steam consumption as in Corliss engines.

Close speed regulation is assured by the Robb governor controlling the cut-off directly.

Duplicates of parts always on hand for prompt shipment, for all Robb engines are made on the interchangeable system.

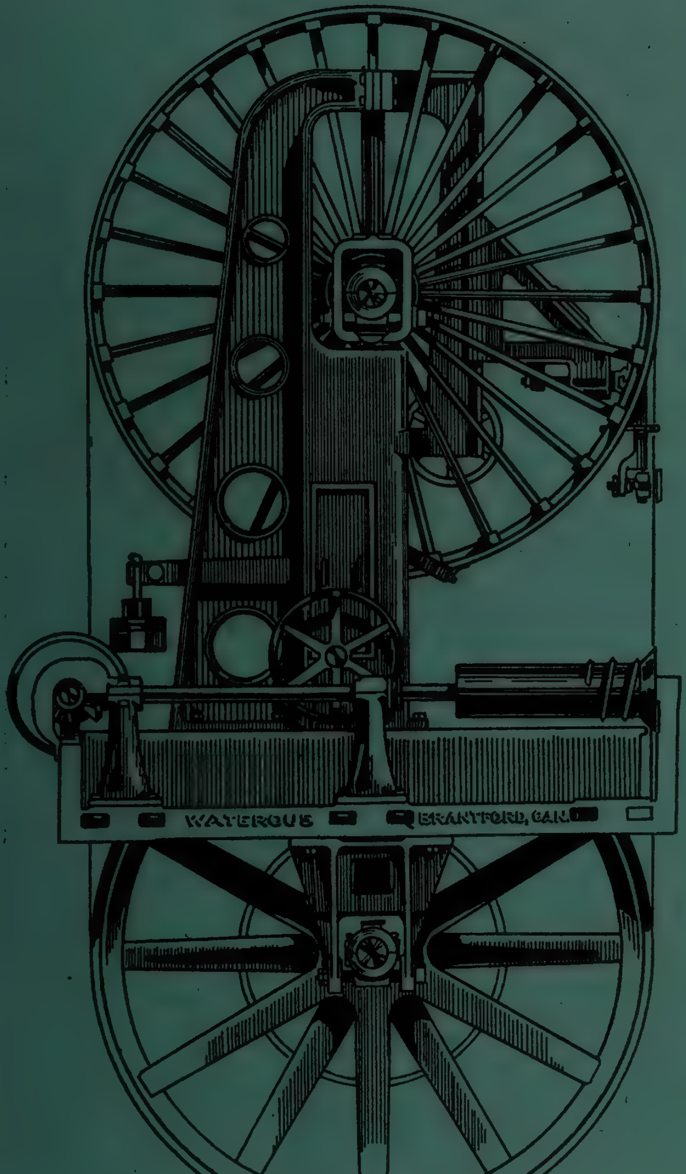
"WHY" and "HOW"

We Build a 7 ft. Band Mill



It will take a saw up to 12-in. blade, will split a 36-in. log, has all the fast cutting features of the larger sized mills and yet represents a saving of several hundred dollars in initial expense, in up-keep in saws and in filing tool equipment.

Although containing all these fast-cutting features, we are able to build this, 7-foot mill cheaper than would be possible if we had not already done the expensive experimental work and tested these features out on our heavier mills. All you pay for is the cost of construction.

HOW—

The Waterous 7-foot Band Mill is built right and left hand for single or double cutting. **The frame** extends completely around the mill, is very wide and deep, carries on it all feed rolls, etc., to make the machine entirely self-contained. **Columns** are a combination of box and girder section, of graceful business-like design, have wide bearings on the frame and grip the mandrel supporting posts above and below the mandrel. The long recess in the columns permits an exceptionally long vertical adjustment of the upper wheel.

Both wheels are built on old designs that have proved themselves practically perfect in weight proportion and smooth running qualities. **Mandrel boxes** are adjustable in all directions, are extra long, babbitted with finest bearing babbit, and are chambered for water cooling.

Tension and tilting device and raising and lowering mechanism are those supplied on our heavier mills. They are completely enclosed within the columns where they are kept absolutely free of sawdust, slivers, etc. A large door in each column permits of ready overhauling. **The tension device** has been in use for several years and has proved itself second to none on the market. Every fulcrum point is double knife edged and weights are carried on self-cushioning springs which absorb sudden shocks and jars that might affect the saw. **The raising and lowering** is effected by means of a hand wheel and double threaded jack screw working in the bottom of upper mandrel supporting posts. Jack screws are connected to raise and lower upper mandrel in perfect line.

Both upper and lower guides swing exactly about the centre of saw blade, both are instantaneous opening, with wide space between jaws for quick removal of sawdust and slivers. **Upper guide** is particularly rigid, is provided with safety slide, has brass plug contact with saw blade and water lubrication. It is raised or lowered by a special steam raising device or by hand wheel and chain—both giving positive and rapid movement. **Lower guide** can be operated from front or rear of mill as desired. Live rolls are carried on the frame, a bevel ended worm roll as illustrated being supplied with double cutter, speed 400 feet per minute.

The bystanding cut made from the machine drawing itself, shows the graceful, clean-cut, business-like design of this mill. Every part is built to combine strength and rigidity, and the mill is put together by experts in this work. We test every machine before it leaves the shop.

WHY—

Because there is a demand for a mill that will handle logs of fairly large diameter—that, is larger than can be cut on a Pony Mill—that will cut faster than the Pony and at the same time will be less expensive than the heavy 8 ft., 9 ft., and 10 ft. mills on the market at the present time.

The Waterous 7 ft. Band Mill fills these requirements in every particular.

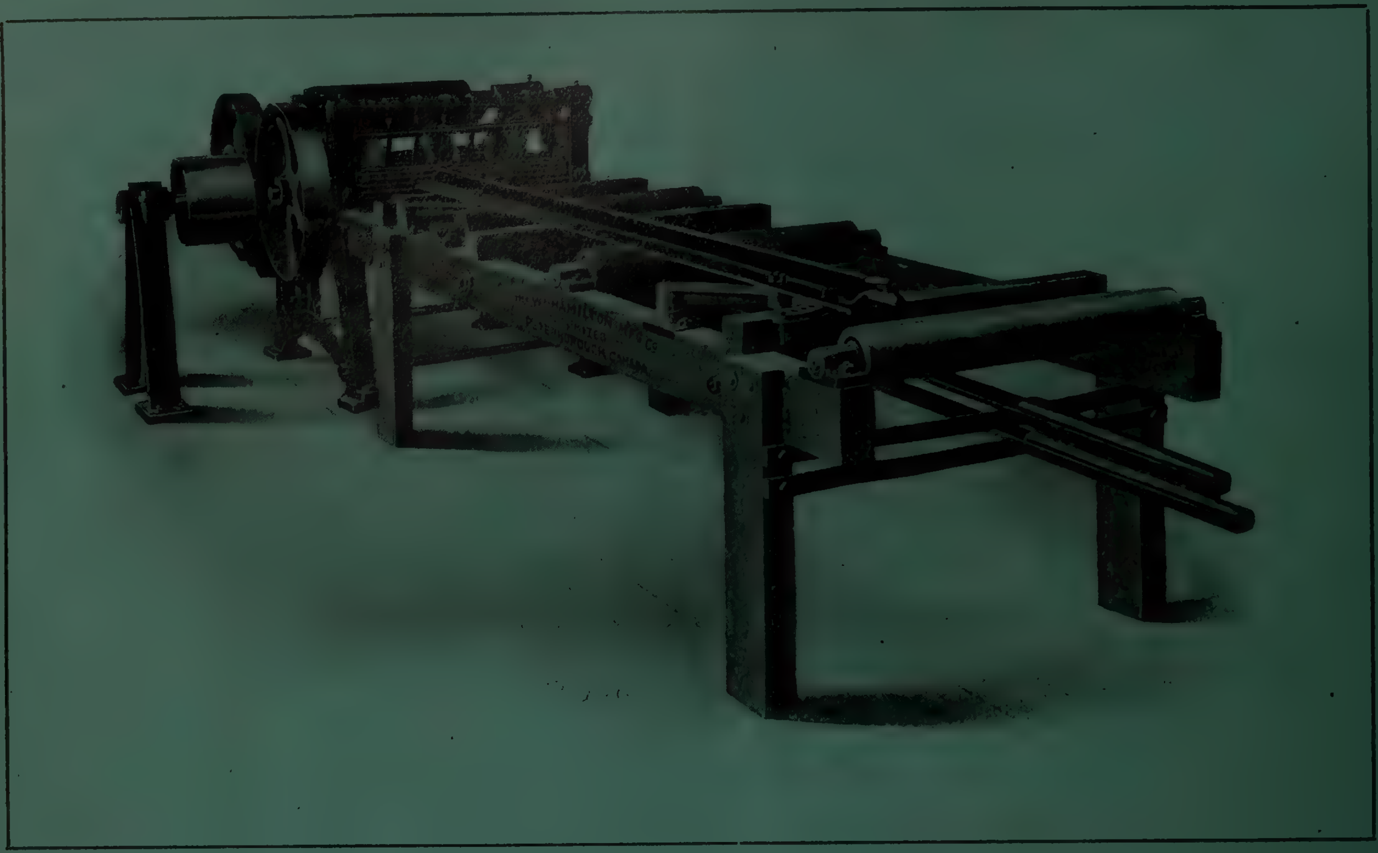
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

INDUSTRIAL LOCOMOTIVES

The value of a locomotive lies in the length of the service and the proportion of time it is ready for use, as well as the work it will perform. We give as much attention to the building of our small locomotives for logging service as we give to our largest and most powerful engines.

Locomotives in this service usually operate away from shops or repair facilities. It is most important that they should be simple and sturdy.

Our engineers are specialists in this class of work with the widest and most varied experience in locomotive design. They have applied this experience in designing our small locomotives.

Our pamphlet No. 10040 illustrates our standard designs. Write for a copy.

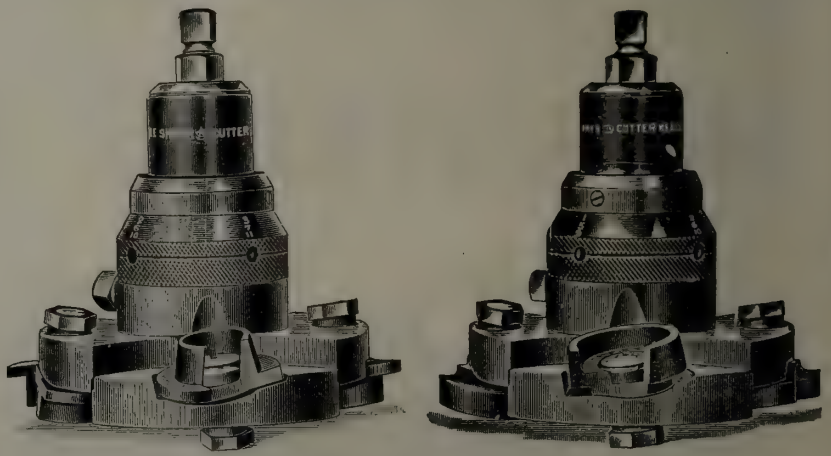
The Colonial Lumber Company Limited

Pembroke - Ont.

"Quality Finish"

on your Flooring, Ceiling, Siding, or on Door and Sash work, will pave the way to larger profits.

The Shimer Cutter Heads



Is the one only tool that makes it easy to do high class work, and that will put the "Quality Finish" on your product without curtailing the output.

Any planing mill can make Flooring if the owner so desires. The trick is in making it so it can be sold at a profit. You should keep ahead of competition by making your Flooring the best in your section. There is no reason why any man in the business should follow "out-of-date" methods when the actual "fit and try" of it and the "Quality Finish" are automatically arranged for in the construction of the Shimer Cutter Heads. Besides you save the time—the worry—the annoyance necessitated by hand fitting.

The Shimer Cutter Heads with the shearing or shave cut insure the "Quality Finish" and the profit, by their smooth cutting, easy cutting and fast cutting. The shearing cut obviates the tendency of the old style cutters to roll up fibers of wood when operating on soft or green lumber, or the burned and blackened edges so common on hard wood worked by "out of date" methods. The absence of the unsightly and troublesome fringe along the upper edge of a strip of Flooring, or of splinters and knots torn out, adds to the value of your product and gives your mill a reputation.

We would like to show you on your own machine just what the Shimer Cutter Heads will do. Write us about your wants today, giving make of machine, and let us quote prices on tools to do your work.

Locating the Selling Points

In building bridges, the engineer has to cross streams, cut embankments, remove obstructions—but he finally gets a short route for folks and goods from *here* to *there*.

Our reports are a bridge between the man who *has* and the man who *needs*.

The man who has and the man who *needs*—they are the parties of real importance in every commercial transaction. If you are the man who *has*, let us explain our facilities for constructing a bridge to the man who *needs*.

In other words; if you want to know where there are opportunities for your getting business, the short cut to wider markets—better prices—is by our service.

Our organization covers the nine Canadian Provinces like a blanket. In each town we have a man who knows how to get news—men who can locate sales opportunities for you.

It is worth while investigating.

Tell us what you sell and where you sell it. If we can serve you, we will tell you how.

It's up to you.

How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, ***power,*** by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for SAVED ENERGY - ***economy.*** Built up of plies of rubberized fabric, cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U. S. A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

GOODYEAR Rubber Belting

High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for ALL mills where the horse power transmitted is large and the demand for tensile strength is great.

Black Diamond Belting

Lighter in weight, lower in price than above, but same in QUALITY. Great quantities sold to Sawmill trade. Hundreds of mill owners say it gives better service than any other belt ever used.

Red Cross Belting

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

Elevator Belts

We make a specialty of **Elevator Belts.** Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping; insures longest service.

Imperial High-Speed Friction Surface Belt

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember* **Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for Catalog tonight.**

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, November 1, 1911 No. 21

Autocratic Extortion by Railways

Attention has frequently been called in these columns to the tax upon the lumber trade, which results from the autocratic behaviour of the railway companies in the matter of settling claims for overcharges. It seems to have become a determined policy of the railways to harrass their customers to the last extreme in this regard. Something should be done by the Railway Commission to put a stop to it. This is the work which the Railway Commission was formed for. Unless it shows some inclination to do its duty there is certain to be an outcry which will result in radical changes. It is not common justice to the shippers of Canada that they should be subjected to the autocratic control of such a body as the Canadian Car Service Bureau which deals with such complaints. This bureau is supposed to be an impartial body sanctioned by the Board of Railway commissioners and working in the interests of the shippers and the railway companies alike. Instead of this, it is a buffer between the shippers and the railway companies and its entire energy is devoted to saving money for the railway companies and harrassing the shippers into subjection.

A year ago this past summer a strike occurred on the Grand Trunk Railway and traffic was badly tied up. Business was handed over to the C. P. R. wherever possible and that company's capacity was overtaxed to such an extent that it could not forward shipments on time. Claims for demurrage resulted and the shippers were thus caught between the upper and the nether millstone. They could not get their shipments forwarded on time to charge the shippers demurrage on the cars which were held up as a result of their own inability to deliver them. Bills were sent to the shippers of lumber and of all other commodities. The bills had to be paid—under protest—before delivery of the goods chould be secured. Claims from the shippers for refunds followed and they should have been settled promptly by the railway companies. But this is not the policy of the railways. They disputed the claims, stating in many cases that the delay in shipments was due to what they pleased to call "bunching in transit," the inference being that the shippers were to blame for shipping too many cars at a time from one place. This shows what flimsy excuses the railways will make, rather than part with money which belongs to someone else. Correspondence is under way to-day in which this is the exact and the Car Service Bureau complacently announces to the shippers that they cannot pay the claims.

The only step left is for the shippers to resort to law, a course which they dislike, but which in cases where there is much at stake, they are olbiged to adopt. Fortunately the railways also have a wholesome fear of the law and in cases where they believe that the shippers are strong enough to press their claims, they often climb down when their last bluff has been called. It should be unnecessary for the shippers to spend such a lot of time and money in this manner. The Railway Commission ought to take up the matter, or if they think they cannot do so, the government ought to do it themselves or give the commission power and instructions to do so. The situation is simply intolerable and the commerce of Canada should not be subjected to such a species of extortion. The Car Service Bureau ought to be forced to reason or else put out of existence.

The Yellow Pine Peril

The competition of yellow pine from the United States with Canadian lumber products, such as Norway pine, spruce and hemlock, has been referred to frequently in these columns and the increasing importations of this wood have led the Canada Lumberman to urge the claim of a large number of lumber manufacturers and wholesalers throughout Canada that a duty should be placed on rough lumber coming from the United States. We believe that it would be an excellent thing for the whole lumber trade, retail as well as wholesale and manufacturing, if Canadian lumber manufacturers were protected to the same extent as United States manufacturers are protected against Canadian lumber. That it is possible, however, for retailers to take a different view of the situation is shown in an interesting letter from a dealer which is published elsewhere in this issue. The writer takes those dealers to task who have objected to the importation of yellow pine. He claims that there is plenty of business for all, that all the manufacturers appear to have made money in recent years and that yellow pine does not compete with hemlock in Canada. So far as the first point is concerned there is at present fortunately, a fair amount of business for all. But the man who claims that there is "plenty" of business for all is either blind to the facts or is not willing to see them in their proper light. If there were enough business for all and if yellow pine were not competing strongly with hemlock, there would be no movement among the manufacturers and dealers in hemlock for the formation of an association, one of whose main objects is to prevent the competition of yellow pine. The hemlock manufacturers and dealers of Ontario who have recently held two important meetings at Toronto, are a unit in their belief that the competition of yellow pine in Canada is a serious cause of loss of business to all who handle or manufacture hemlock. At the first of these two meetings recently held, a long discussion took place regarding the necessity for educating the architects of Canada to a proper understanding of the relative merits of hemlock and southern yellow pine. The inflammability of yellow pine was discussed, and it was stated by several manufacturers—retailers, wholesalers and dealers—that Canadian architects could assist them greatly if they would advise their clients that yellow pine was so inflammable as to be a menace to a building, and if they would encourage the use of Canadian woods, chief among them being hemlock.

There is no proper comparison with the placing of a duty on yellow pine, and the formation of a combine to raise prices, as suggested by the writer of this letter. A combine would be an evil if it were completely effective and resulted in extorting a price from the consumer in excess of the cost of producing and selling lumber together with a reasonable profit. The placing of a duty upon yellow pine would be an altogether different matter. The object of the duty would not primarily be to raise prices. If prices at present represented a fair profit there would be no clamor for a duty. Prices, however, at present, and for a long time past, have permitted little or no profit, and have in many cases involved a loss. The desire of those who call for a duty on yellow pine is to secure a price that will enable them to manufacture hemlock at sufficient profit to induce them to continue in business. To-day practically every manufacturer of hemlock in Ontario is doubtful whether it will pay him to cut more than a very small portion of an average stock of logs during the coming winter.

As to the alleged discrepancies in the statements made in a recent editorial in the Canada Lumberman, the writer of the letter referred to does not understand the argument which was made. The point is simply this, that in New York state Canadian hemlock is favored by the architects because they have found that it is safer for large buildings than yellow pine, as it is not inflammable to anything like the same extent. In Ontario, however, architects from many parts of the United States, knowing that the building by-laws do not discourage the use of yellow pine, frequently specify it, and the result is that it finds its way into many of the large public buildings and manufacturing and business offices of the country. We believe that this is an evil which should be considered carefully by the government and my municipal authorities, and that a duty upon rough lumber from the United States should be imposed by the Dominion government equal to the duty of $1.25 per thousand feet upon Canadian rough lumber entering the United States; also that municipal authorities throughout Canada should make a study of the relative merits of Canadian hemlock, Norway pine and spruce and United States yellow pine, with a view to discouraging the use of the latter in public buildings.

If this course were adopted the writer of the letter referred to would find his trade in yellow pine seriously reduced, but if he is patriotic enough to wish for the success of his fellow Canadians he would make no complaint about this, because it would be possible and profitable for him to direct his attention to the sale of lumber manufactured in Canada, for which he would secure just as much profit as in the sale of yellow pine, and by means of which he would be keeping in circulation at home the large amount of money that now leaves the country, going to the southern cities to enable improvident manufacturers to meet their bonded indebtedness and to carry on for a little time longer their absurd over-production.

The Prairies' Interest in a Duty on Lumber

The views which have been frequently expressed in the Canada Lumberman regarding the increasing importation of United States lumber into Canada, and the urgent necessity for some measure of protection to prevent the dumping of surplus stocks from that country at a sacrifice, in Canada, are strongly backed up by the Victoria Colonist, of Victoria, B.C. In a recent editorial entitled "Dumping Lumber," The Colonist says:—"A meeting was recently held in Calgary to discuss the ways and means of preventing ruinous competition in the lumber markets by the sawmill owners in the United States. It was stated at the meeting that since May 1, 168,000,000 superfivial feet of lumber has been brought into the Prairie Provinces from that country. One of those present mentioned that ship-lap had been bought in Seattle for $5 per M., which is away below the cost of production. Even the mills of East Kootenay connot compete against this, although they have all the advantage of a shorter haul. The lumbermen of British Columbia recognize that conditions are exceptional and it is hoped only temporary in the United States, but while these continue they are exposed to a competition that they cannot meet. Temporarily the consumer on the Prairie gets a benefit from this low rate, but it is open to question if this is an advantage in the long run. Manifestly the Puget Sound mills cannot long continue to sell lumber for less than cost, and so such an exceptionally low quotation as that referred to might not justly be taken into serious account in determining the policy of the Dominion as to duties on lumber: but we invite the Prairie people to consider if it might not be to their advantage in the long run to have reasonable restrictions placed upon the importation of lumbed from the United States. The Prairies are at present a dumping ground for the unsaleable products of the sawmills of that country, and this operates to prevent the healthy expansion of the British Columbia lumber industry, which would tend to keep prices down to a moderate margin of profit. It might also be well for the people of the Prairies to consider that, if they bought British Columbia lumber to the exclusion of the United States products the money paid out would go to possible consumers of the products of the Prairies, instead of to people who do not buy those products.

"We have heard no suggestion as to the policy which Mr. Borden will propose in regard to the tariff on lumber, and we present the above considerations only because it seems as though they should be borne in mind in thinking over the matter."

The Curtailment of Operations in British Columbia

It is not surprising that evidences of an outcry are already plainly noticeable against the reported proposal of the lumber manufacturers of the province of British Columbia to close down a number of their mills during the year 1912, to reduce their logging operations during the coming winter and to conduct their selling business through one central agency. The public is always on tiptoe, ready to raise the cry of "combine" and a proposal of this nature was predestined to meet with an outcry of this nature. As in many other cases however it seems to be just as probable that the public is barking up the wrong tree.

At the time of writing we have only the press reports of the proposal to go upon. From their unanimity however, it appears that the manufacturers of British Columbia have at last decided to take a step which many of them have long believed to be necessary. Overproduction, and competition from the lumber manufacturers of the United States have reduced the lumber selling business of British Columbia and the Prairies to a state of chaos and if the lumber manufacturers of British Columbia are to continue in business it is necessary that some steps be taken to save them from the continual losses consequent upon these conditions. Canadian Governments have failed to protect Canadian lumber manufacturers against United States rough lumber and the manufacturers themselves must stop overproducing and do their best to reduce the selling costs, if they wish to sell their products in competition with United States lumber.

But the consumer must of course be considered and somewhere about this fact is to be found the kernel of the situation. It is more than doubtful whether the consumer of lumber is benefitted by the low prices which have been in force for the last few years. United States lumber which has been dumped upon Canadian markets has not in many cases been of a quality to compensate the consumer for the reduced price. That this is so, is indicated by the fact that some of the members of the retail trade have continued their demand for the Canadian products in spite of the allurements of the cheaper United States lumber. The consumer also, has not infrequently found it to his advantage to buy Canadian lumber, after he has found out by experience that the delays in shipment by United States mills more than offset any advantage which would have resulted from lower prices.

The issue is clearly defined and is simply this:—Is the Canadian lumber manufacturer justified in taking steps to protect himself against the competition of the United States manufacturer, seeing that the government refuses him the protection to which he believes he is entitled, and is he also justified in trying to reduce the cost of selling his lumber? Is he, in addition, justified in trying to prevent overproduction? We believe he is justified and our reasons are as follows:

The timber resources of Canada are not inexhausible. It is the duty of those who own timber in Canada to avoid cutting it in excess of the demand of the country for lumber. This alone should justify the manufacturers in curtailing their output under the conditions existing at present which clearly indicate overproduction during the last few years. The prices of lumber affords another reason. Apparently the proposal is not based on any idea of forcing from the consumer a price in excess of a fair profit over and above the cost of manufacturing and selling. The evil of combines, which the law seeks to prevent, is the taking of unreasonable profits from the consumer. The danger of an unfair price ever being secured for lumber is so remote as to be infinitesimal. The competition of the smaller mills not included in an agreement like the one under consideration, and also the competition of United States rough lumber which enters Canada free of duty will effectively prevent this.

It is humorous, for these reasons, to read in a paper published at Seattle, Wash., a caustic editorial article criticizing the alleged lumber combine in British Columbia. This paper professes to find in the proposal not only a menace to the trade of the United States manufacturers in Canada, but a danger that Canadian lumber producers will shortly destroy the markets in the western States. It makes a clamor against the alleged trust and seeks to incite public opinion against it. At the same time there is under way a full fledged movement among the mills of the Pacific Coast States towards something far more closely approximating a real live combine. This is aproposal for a merger of a large number of Pacific Coast mills into a single company, which will control for all time their output and their business policies. Such an organization would be able under present conditions to more than hold their own in the markets, both of the United States and Canada, and if it was thought wise, they could extort from the consumer an unfair price for lumber. This would not be possible for the manufacturers of British Columbia under the arrangement which is now proposed and which is being branded as a combine.

Reducing the matter to as brief a form as possible it does not appear that there is any menace against the public on the face of the proposal of the British Columbia manufacturers. It is scarcely generous, to say the least of it, on the part of the United States newspapers or lumber manufacturers to condemn the proposal as an unwarranted encroachment upon what them seen to consider as their own private reserve, the Canadian lumber market. It looks very much like a case of stone throwing by people who live in glass houses. The proposal of the British Columbia manufacturers may quite conceivably result in a benefit to the whole lumber trade of Western Canada without any injury whatever to the consumer.

Editorial Short Lengths for Busy Readers

An interesting item of news is the reported sale of several million feet of the choicest stock to be produced by the Thessalon Lumber Company, Thessalon, Ont., to Mr. Robert Cox, of Ottawa, for shipment to England. The sale is looked upon as of considerable importance, as it is the first large sale of lumber from that district for the English markets.

That a logging camp operated under ordinary conditions does not constitute an engineering work, and that men employed there can not come within the scope of the Employers' Liability Act, is the opinion of Judge McInnes, in a judgment handed down in the case of Mr. George Weaver against Mr. Alexander Barber at Vancouver, B. C. Weaver brought action claiming $1,500 damages for injuries received at a logging camp at Bute Inlet, where he was employed by Barber. The plaintiff slipped on some logs, and one of them rolled on him injuring his back.

Ottawa has been selected as the place for holding the next annual convention of the Canadian Forestry Association. The date is February 7 and 8, 1912, which coincides with the annual meeting of the Canadian Lumbermen's Association, and it is proposed that the two associations shall hold a joint banquet on the evening of February 7. Both associations expect an array of distinguished speakers, and the event will be one of the biggest of the kind ever held in Canada. Efficient committees have been appointed to look after the different features and Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, and Mr. James Lawler, secretary of the Forestry Association, both of whose offices are in Ottawa, will co-operate in the work.

The Forestry Branch of the Department of the Interior is conducting an exhaustive statistical study of the industries in Ontario which in any way use wood in the manufacture of their products. This report will cover practically every manufacturer in Ontario, for besides those using wood directly, as in the manufacture of vehicles, cars, boats, automobiles, furniture and interior finish, it is also expected that reports will be secured from every industry consuming wood for boxes and shipping crates. Information forms will shortly be sent out and the data obtained will be published in bulletin form, including a classified list of co-operating firms, a technical discussion of the various woods used, as well as statistics on the consumption and cost of each species. All individual information will be held strictly confidential by the Department. Such a work will be of benefit to every producer and consumer of wood in the province. To the mill-owner, it will show the purpose for which certain species are used, the quality of wood required and the prices paid. The manufacturer can ascertain what is the relative importance of his class of industry, and the total consumption and value of wood used in manufacture. Every manufacturer reporting will receive a copy of the bulletin when published. All those receiving schedules are asked to co-operate by reporting fully and promptly.

The exportation of pulpwood in a raw form from Canada into the United States is increasing yearly, and by just so much does Canada lose the benefits to be derived from manufacture and the increased value of raw products. The Forestry Branch of the Department of the Interior has compiled statistics showing that over a million and a half cords of pulpwood were cut in Canada during 1910, worth nearly nine million, eight hundred thousand dollars. Over sixty per cent. of this amount was sent out of Canada without further labor being expended on it. The United States manufactured it into pulp and paper. From United States Forest Products Bulletins, it is seen that approximately two-fifths of the pulpwood imported by that country is manufactured into mechanical pulp, and three-fifths into sulphite pulp, and that a cord of wood produces one ton of mechanical pulp or one-half ton of chemical pulp. This means that of the nine hundred and forty- three thousand cords of Canadian pulpwood sent into the United States in 1910, three hundred and seventy-seven thousand tons of mechanical pulp and two hundred and eighty-three thousand tons of chemical pulp were made. The value of this pulp, for which Canada received six million, two hundred and ten thousand dollars as pulpwood, was over thirteen and a half million dollars at the average prices paid in 1910 by United States importers of pulpwood. Thus Canada did not get one-half the amount she would have received if all the pulpwood were converted into pulp on Canadian soil. As the United States does not export two per cent. of what it imports, a certain and steady market would be found for all the wood pulp of Canadian production.

Lumber, Timber, Lath and Shingles

Statistical Report Upon Production of Various Classes During 1910 —New Species Entering Market—Interesting Price Comparisons

(Concluded from previous issue)

Hemlock:—Under this are included both the Eastern and Western species. Hemlock, cut in 1232 mills in seven provinces of Canada, makes the third of the trio cut in over 1,000 mills—spruce, white pine and hemlock. Each of the provinces increased its cut over 1909, so that the total cut for 1910, 435,168,000, is 50 per cent. more than last year. The greatest increase last year was in Ontario, and this year also the cut of this province increased 48,595,000 or 30 per cent. In 1910, however, the honor of the greatest increase is due to British Columbia, which cut 81,232,000 or 358 per cent. more than last year. Quebec with just 27 mills less than Ontario did not cut one-third of Ontario's amount, although it improved on its last year's cut by 12,511,000 feet, or 22.7 per cent. Nova Scotia, New Brunswick and Prince Edward Island also had smaller increases. The price of hemlock increased 64 cents in 1910, making it one cent. per thousand dearer than in 1908. It was dearest in British Columbia at $14.34 and cheapest in Prince Edward Island at $11.16.

Four American states, Wisconsin, Pennsylvania, Michigan and West Virginia exceed Ontario in hemlock production; whereas five did so in 1909. British Columbia cut a trifle more than the state of Washington. The average price of hemlock in the United States for 1908 was $13.95. In Canada it was $11.81 for the same year.

Production of Cedar

Cedar:—Under this heading are included the white cedar of the East, the red cedar of the Pacific coast and the cypress of the Pacific coast. Very little of the latter is manufactured.

Besides the amount listed as lumber, poles to the value of $1,000,000, cross ties worth $1,500,000 and shingles worth $3,262,000 were reported for 1910. This is a total for the 1910 cut of cedar of over $12,000,000.

Cedar is one of the species which made great advance in 1910. The 406,821,000 feet of this species, cut by 618 mills, is an increase of 217,430,000 feet, or 114 per cent. over 1909. British Columbia, with not one-sixth of the mills, cut over three-quarters of the total, and increased the 1909 cut in the province by 174,619,000 feet, or 124 per cent. An increase of 152,160,000 feet, or 365 per cent. in Ontario's cut of cedar raised it from fourth to second place, held last year by Quebec. The cut in the last named province is steadily decreasing, showing a drop of 36.5 per cent. in 1909 and a further fall of 1,187,000 feet, or 6.8 per cent. in 1910. New Brunswick's cut decreased over 50 per cent. no returns were received from Prince Edward Island for this species, and for the first time a fair sized cut was received from Manitoba.

The average price of cedar throughout Canada increased $1.51 in 1910, though it is still 32 cents less than the cost of cedar in 1908. British Columbia is the sole cause of the increased price, the cedar in this province being valued at $15.75 or $2.32 more than last year. The price in other provinces, except Manitoba, was less than in 1909, the cheapest cedar being found in New Brunswick at $10.16 per thousand.

No state of the Union equals British Columbia in cedar production, and the 1910 cut in the province alone was equal to 91 per cent. of the total amount of cedar cut in the United States during 1909. The nearest single approach to British Columbia is Washington which cut 183,952,000 feet. Idaho, the second most important cut was only 28,644,000 feet, which Ontario erceeds by 35,781,000 feet, or 125 per cent. The average price during 1909 was $22.88 in Washington, $13.43 in British Columbia, $19.95 for the United States, and $13.96 for Canada.

Production of Yellow Pine

Yellow Pine:—The only yellow pine cut in Canada is the western yellow or bull pine of southern interior British Columbia. This should not be confused with the hard yellow pine imported in large quantities into Eastern Canada from the Southern States.

This species has the largest average mill cut. The 42 mills cutting yellow pine are all in British Columbia and between them cut in 1910, 182,966,000 feet or 4,356,000 feet per mill. This is 155,991 or 578 per cent. more than was cut during 1909. By this remarkable increase yellow pine is raised from fourteenth to sixth place in importance as a timber species. Notwithstanding this increase, there are three states in the United States which each produce more yellow pine than British Columbia and consequently Canada. Yellow pine in 1910 had an average mill value of $15.95 which is $3.13 more than in Canada during 1909 and $3.26 more than in the United States for 1909.

Production of Red Pine

Red Pine:—This is confined to Eastern Canada. There was an increase of 14,202,000 feet or 8.6 per cent. in the red pine cut for 1910. This was not sufficient to maintain it in sixth place and in 1910 for the first time the red pine of the east was exceeded in output by yellow pine of the west. In 1909 red pine lost its position of fifth to cedar. Ontario, with approximately half of the 260 mills cutting red pine in Canada, produces over nine-tenths of the total cut. The cut in Ontario for 1910 exceeded that for 1909 by 13,375,000 feet, or 8.7 per cent. Quebec is second in red pine production and increased its 1909 cut by 428,000 feet or 5 per cent. This is still much below its 1908 cut. There was an increase in Nova Scotia of 352,000 feet; New Brunswick nearly doubled its cut, and for the first time a report was received from Prince Edward Island. The average price of red pine in Canada is almost constant, decreasing twelve cents per thousand in 1909 and one cent in 1910. The lumber from Prince Edward Island was reported at $22.00 per thousand, making it the most expensive in Canada. It was cheapest in Nova Scotia at $13.57.

The United States Government reports include red with white pine. Therefore a comparison cannot be made.

Tamarack:—This term includes both the Eastern and the Western species. The western species is manufactured in British Columbia only. Tamarack was also used as poles to the value of $240,092 in 1910. The cut of tamarack was 68,720,000 feet in 1909 and 165,122,000 feet in 1910, an increase of 96,402,000 feet or 140 per cent. British Columbia alone more than accounted for this increase with six mills cutting 97,737,000 feet or 218 per cent. more than in 1909. The cut in this province constituted 86.3 per cent. of the total, while Ontario with 166 mills made up only 10 per cent. of the total. Two additional provinces reported tamarack for this year.

The average price of tamarack advanced 26 cents from 1909 to 1910, while an increase of $1.01 is recorded for 1909 over the year previous. Among the four important tamarack provinces this species was dearest in Ontario at $14.86, and cheapest in Quebec at $12.67.

In 1909 the average price of western tamarack in the United States was $12.39, the price of eastern tamarack was $13.18. In Canada the prices were $15.38 and $14.58 respectively for the same year.

Balsam Production

Balsam:—The balsam reported by Canadian lumbermen is all the eastern species. Small quantities of the western species are cut in Alberta and British Columbia, but are not reported separately; they are probably mixed with and sold as spruce. Balsam lost its place to larch and now stands ninth in production. The 810 mills cutting balsam in Canada produced 123,920,000 feet, 32,855,000 feet, or 36 per cent. more than in 1909. Seventy per cent. of the total cut was in Quebec, which surpassed its 1909 cut by 17,512,000 feet, or 25 per cent. Ontario, with 183 mills, cut 15,307,000 feet, while 28 mills in New Brunswisk cut almost the same amount, which, for New Brunswick, was 9,778,000 feet, or 179 per cent. more than the cut of last year. Nova Scotia and Prince Edward Island also had increases, but together form less than five per cent. of the total.

The price of balsam lumber is gradually increasing as other species become more scarce. In 1910 it was $13.07 per thousand, 22 cents more than the previous year and 54 cents more than in 1908. As before, it was highest in Ontario, at $14.07, and lowest in New Brunswick, at $11.68.

The cut of balsam in Canada for 1910 was 15,218,000 feet more than in the United States during 1909. Maine producing more balsam than any other state, cut 36,801,000 feet or 42 per cent. less than did Quebec. The average price of balsam in the United States for 1909 was $13.99. It was $12.85 in Canada for the same year.

Birch:—This is the hardwood which figures most extensively in the lumber trade of Canada. All species of birch are included, the most important of which is yellow birch.

Birch was cut by 843 mills during 1910 and shows an increase of 18,165,000 feet or 34.2 per cent. over 1909. Over one-half the birch cut in Canada is produced in Quebec which last year held third place but increased 23,694,000 or 190 per cent. in its annual cut. There was a very slight increase in the cut of Ontario which was not sufficient to maintain it in the premier position. The birch cut increased 3,000,000 feet in Nova Scotia, fell off over 9,000,000 feet in New Brunswick, and was of small amounts in Prince Edward Island, Manitoba and British Columbia.

The price of birch decreased $1.49 in 1910, making it only 33 cents more expensive than in 1908. It was cheapest in British Columbia at $10.00 and highest in Ontario at $18.34.

More than six times as much birch is cut in the United States yearly as in Canada. Wisconsin produces annually more than all Canada, while Michigan and Maine produced more than did Quebec. Likewise the above three with Vermont, New York and Pennsylvania, cut more than Ontario. The average price in the United States in 1909 was $18.95; in Canada it was $18.68.

Maple:—All species of maple are included; nearly all the lumber manufactured is hard maple. In 1910, 736 mills in six provinces produced 60,547,000 feet which exceeds the 1909 cut by 17,475,000 feet or 40.5 per cent. In spite of this large increase maple is still eleventh in the list of Canadian woods and second in the list of hardwoods. The great increase in the maple cut was in Ontario where 86 per cent. of the maple was produced. 16,180,000 feet or 45 per cent. more was produced in Ontario during 1910 than 1909. Quebec with over half as many mills as Ontario produced about one-eighth the quantity of maple. New Brunswick and Nova Scotia both suffered severe set-backs, of which Nova Scotia's was the more severe, so that New Brunswick moved up one place in the 1910 output. The average price of maple increased to $17.35, 42 cents more than in 1909. As formerly it was lowest in New Brunswick at $10.87. It was highest in Ontario at $17.90.

The annual cut in the United States is about seventeen times greater than in Canada, in 1910 being 1,106,604,000 feet. Michigan, Wisconsin, Pennsylvania and New York cut more maple per annum than Canada, and West Virginia cuts more than Ontario. The average of maple in the United States for 1909 was $15.77, and in Canada it was $16.93.

The Basswood Cut

Basswood:—One species of basswood is found in Canada. Basswood was cut by 846 mills, the greatest number cutting one species of hardwood. The cut of basswood in Canada for 1910 was a little greater than in 1908, showing an increase of 7,942,000 feet or 18.6 per cent. Ontario cut just half as much again as did Quebec, but the 1910 increase was nearly all in Quebec. The cut increased in this province by 7,347,000 feet or 58 per cent. Basswood was reported from New Brunswick for the first time. The price of basswood in 1910 took a considerable drop, being $1.34 less than last year and 92 cents less than in 1908. The price in Quebec dropped $4.12 during the year.

The United States produces annually nearly eight times as much basswood as does Canada. The cut in 1909 was 399,151,000 feet. Wisconsin and Michigan each cut more basswood in 1909 than Canada did in 1910, and New York State cut more than did Ontario. The average price of basswood for 1909 in the United States was $19.50, 16 cents less than in Canada.

Elm:—There are several species of elm cut in Canada, of which the most important is soft elm. Besides this amount of elm cut as lumber nearly three-quarters as much, or elm to the value of $563,713, was used in the 1910 cooperage industry of Canada.

Elm is another hardwood in the production of which Ontario leads. The total cut of 42,936,000 feet is produced by 662 mills. Nine-tenths of the elm lumber in Canada is cut in Ontario, which cut approximately 6,000,000 feet more in 1910 than in 1909. Quebec ranked second with 9.5 per cent. and increased its 1909 cut by 2,138,000 feet. Small reports, not received before, have come in from New Brunswick, Nova Scotia and Prince Edward Island. The average price of lumber increased 88 cents to $17.97, which is five cents per thousand more than the amount paid for elm in 1908. The average value per thousand ranged from $10.91 for Prince Edward Island to $38.90 for Nova Scotia.

The annual production of elm in Canada and the United States is about in the same proportion as with basswood. Wisconsin and Michigan each cut more elm per year than is produced in Canada, and Indiana cuts more than Ontario. Elm had an average price in the United States for 1909 of $17.52; in Canada for the same year it was $17.09.

Jack Pine:—The eastern species of jack pine, sometimes called grey or scrub pine, or in Quebec, cypress, is known to botanists as pinus banksiana. The western species cut in British Columbia under the names of ledge-pole or black pine is known as pinus contorta. The cut of this small species of wood was carried on in 136 mills and amounted to 40,234,000 feet in 1910, an increase of 12,415,000 feet, or 42.9 per cent. over the cut of last year. Ontario contributed 55 per cent. of the total and to do so increased its annual cut nearly 9,000,000 feet. British Columbia, as in 1909, shows a small increase, but still makes up 15 per cent. of the total. Alberta, Quebec, Saskatchewan, New Brunswick and Manitoba each cut more jack pine than in 1909, while Nova Scotia's cut decreased by one-third, lowering it from fourth position to sixth. Jack pine does not grow to large size and is used chiefly for ties and mining props. The value of this inferior species is gradually increasing, being 12 cents more in 1910 than in 1909, and 72 cents more than the year previous. Nova Scotia supplied the cheapest jack pine at $10.52 and Quebec the most expensive at $16.72.

Jack pine is called lodge pole pine in the United States report of 1909, and grows only in the western states. Over 23,000,000 feet of this variety was cut for the same purpose as in Canada, costing $16.25, $2.79 per thousand more than in British Columbia for the corresponding year.

One Species Only of Beech

Beech:—One species only of beech is cut in Canada. The increase in the cut of beech, although nearly 200 per cent. in 1909, was this year a little less than the average increase for the Dominion. 18,565,000 feet were cut or 3,529,000 feet more than last year. Ontario produced nearly three-quarters of the total and increased the provincial cut by 5,229,000 feet or 64 per cent. The amount of beech cut in Nova Scotia and New Brunswick was considerably less than in 1909. Quebec's cut, like Nova Scotia's, formed over 10 per cent. of the total, increasing the amount cut 1909 by over 50 per cent. The price of beech in Canada during 1910 dropped $1.89, owing to a decrease of $3.66 in the large amount cut in Ontario.

In the United States the annual cut is over 27 times as great as in Canada. Tennessee, a state eighth in importance for beech, produced approximately the same amount as did the seven provinces of Canada. The average cost of beech in 1909 was $13.25 in the United States; $11.00 in Tennessee; and $14.36 in Canada.

Ash:—There are two species of ash cut in Canada, white ash and black ash. The mills of Canada cutting ash, 651 in number, cut only 166,000 feet (not one per cent.) more in 1910 than in 1909. A little over one-half was in Ontario, while Quebec supplied most of the balance. The small increase caused beech to be raised one place in importance. The increase produced by the 336 mills cutting in Ontario was 106,000 feet over last year. The decrease in Quebec more than balanced this falling off 167,000 feet. Nova Scotia, the most important of the maritime provinces, cut 252,000 feet or 213,000 more than in 1909. This increase puts the province ahead of its record cut in 1908 of 236,000 feet. The average price of ash in Canada was 38 cents higher in 1910 than in 1909, and 22 cents less than in 1908. Ontario supplied the most expensive ash at $20.89 with New Brunswick a close second. Quebec, the cheapest of the three provinces, received $4.58 per thousand less for its ash than did Ontario.

Six states in the United States cut more ash than is cut in Canada. The total American cut in 1909 was 291,000,000 feet, costing an average of $24.44 per thousand; in Canada it was $18.40.

Production of Oak

Oak:—Only three species of oak found in Canada are sufficiently common to be of importance to the lumber industry. The small oak groves of the provinces are still being cut over with the result that Canada had an output of oak in 1910 amounting to 8,718,000, nearly one-third more than in 1909. Ontario supplied four-fifths of the total, Quebec more than doubled the cut of last year, producing exactly 1,000,000 feet, while the cut in Nova Scotia was greatly decreased. The average cut of only 22,000 feet per mill of oak indicates in what manner the oak is scattered throughout the country.

Excepting walnut and hickory, oak is the most expensive of native woods, costing $29.72 per thousand. In 1908 the price was $31.72.

Oak is the most important hardwood in the United States and is third in importance as a timber wood. Nearly four and a half million feet were cut in 1909, over 500 times as much as was cut in Canada for 1910. The average price for the United States was $20.50; in Canada for the same year oak was worth $9.47 more.

Poplar:—There are several species of poplar in Canada, some of them widely distributed in large quantities throughout the northern timber belt. None of them are yet cut in large quantities for lumber. Those most commonly manufactured into lumber are: large toothed aspen, aspen poplar, and balsam or black poplar. Ontario figures may include a small quantity of yellow poplar or tulip which constitutes the poplar cut of the United States.

There was only a small increase of 7 per cent. in the total cut of 8,000,000 feet in the 1910 cut of poplar. This increase was mainly in Ontario which produces more than the other provinces taken together. Quebec contributed over one-quarter of the total and six other provinces cut smaller amounts. Saskatchewan was the only province which did not report some species of poplar.

The average price of this unimportant species is advancing. In 1908 it was $12.45; in 1909 it was $13.57, and this year it reached $14.71, an advance of more than one dollar per year. Yellow poplar or tulip of the United States had an average price of $25.39.

Hickory:—This is another of our hardwood species which is nearly extinct in Canada and is in great demand. It is now confined to stray trees in farmer's woodlots. The chief trees of this species used are shag-bark and bitternut hickory. Considerable hickory is cut yearly and used by implement industries and for spokes, hoops and bent work which is not included in the returns. As the native supply of hickory is decreasing importations are increasing. It is the only other species besides white pine for which a decreased production was reported for 1910. Only 693,000 feet were cut, or 17 per cent. less than last year, which in turn did not amount to three-quarters of the 1908 cut. The decrease was altogether in Ontario. Quebec does not seem to have discovered all the trees of this species as yet, but the increase in the price of hickory will soon call them forth. In 1909 the average price of hickory was $6.45 greater than in 1908, and this year is become more expensive than walnut, $39.61 per thousand.

The following species, except butternut and walnut, have been reported this year for the first year and indicates in what manner the less used species are being developed to supply the increasing demand for lumber and the increasing difficulty of obtaining it.

Chestnut:—This is a hard, durable wood suitable for railway ties, and is very handsome in woodwork and furniture.

The first reported cut of chestnut amounted to 380,000 by nine mills in Ontario at an average cost of $21.84. This amount was in all probability used in furniture construction as over 940,000 feet of this species was imported by furniture and car industries.

Chestnut has just recently been cut on a considerable scale in the United States. Last year's cut was 663,000,000, worth $16.12 per thousand.

Butternut:—This is a species which grows sparsely in the lake region as separate trees. None was reported in 1909 and only 15,000 feet in 1908.

Eleven mills, of which six were in Quebec, cut 281,000 feet of butternut during 1910. Quebec supplied over four-fifths of the total, while Ontario with 45,000 feet, made up the balance.

Canada produced nearly one-quarter as much of this species as did the United States, and at a smaller price.

Walnut:—There is but a small quantity of walnut in Canada, which will be greatly decreased by this year's large cut.

Walnut lumber was produced to the extent of 273,000 feet by 20 mills. This is an increase of 400 per cent. over the 1909 cut and is mainly seen in Ontario's cut. The cut in this province was nearly nine-tenths of the total. Quebec by increasing its cut ten times made up 11 per cent.

The increased cut of walnut may be due to the high price in 1909, $47.84 per thousand. This year it lowered again to $39.26.

Cherry:—This is another species for which reports were received this year as a native wood for the first time, although many odd trees have been cut for furniture companies previously.

The cut of cherry in Canada for 1910 was 73,000 feet reported by seven mills. Six mills (mostly portable) cut 55 per cent. of this in small amounts averaging $30 per thousand. 25,000 feet was produced in Quebec, the price of which was $20.00.

Tulip:—This is known as tulip in Canada and yellow poplar to the south.

Twenty thousand feet of this wood was cut by one mill in Ontario and sold at $30 per thousand. Commercially it is of no importance as compared with the 1,600,000 feet imported from the United States during this year.

Sycamore:—Sycamore, or plane trees, grows very sparsely up into the southern part of Ontario.

Thirteen thousand feet of sycamore was cut in 1910 by two Ontario mills. The price given is $19.23 per thousand. The combined production of the United States was over 56,000,000 feet, worth $14.77 per thousand.

Alder:—This was reported to the amount of 4,000 feet from a British Columbia mill, at $9.25 per thousand, which is $6.68 more than was paid for 350,000 feet cut in the United States during 1909.

In variety of species Ontario is the centre of Canada's lumber industry, leading in the cut of 17 kinds of wood in 1910. Four of these were soft woods and 13 were hard woods—all woods of technical value and importance.

British Columbia had four soft woods in which it led, and this year alder was added to the list. Quebec made an addition to its list by cutting over half the total amount of birch produced in Canada. Last year Ontario cut the greater part of the birch lumber.

Year by year the export trade of square timber becomes less, due to the inadequate supply of clear timber suitable for squaring. The extent of the decline may be seen by referring to Bulletin 11 of the Forestry Branch, where the export trade of square timber is dealt with fully. The exports in 1910 did not amount to six per cent. of the quantities exported annually from 1871 to 1889.

During 1910 3,480 tons less were exported than in 1909. An increase in the price per ton of $2.03 partly compensated for the decrease in volume exported, and made the total value $985,255, or $6,236 less than in 1909.

White pine, always the chief exported species, this year constituted 57 per cent. of the total exports, 1,000 tons more of it being exported than in 1909. Birch was exported in 1910 to the extent of 60 per cent. of the 1909 amount, but still maintains its accustomed position of second in the table. The 6,095 tons of elm shipped is nearly four times as much as during 1909, and, considering the price, was of better quality. The above three species, white pine, birch and elm, make up 95 per cent. of the exportations in square timber. Nearly twice as much oak was exported this year as in 1909. Ash fell off considerably and maple increased. Red pine, last year an important species and amounting to over ten per cent. of the total, in 1910 was reported only as 3,000 tons, elm taking its place.

White pine was the most expensive species exported at $31.22 per ton, with elm next at $28.08.

Over 97 per cent. of the square timber exported is shipped to the United States.

Production of Shingles

There was an apparent decrease in shingle production during 1910. This, however, is due to an error made last year in returns from Prince Edward Island, which mistake made the total larger than it should have been. The total amount of 1,976,640,000, worth $3,557,211, is therefore more than in 1909. This amount is less than the value of each of the first five species of importance in the Canadian lumber cut—spruce, white pine, Douglas fir, hemlock and cedar.

British Columbia is far in advance of the other provinces as a shingle producer, and made up approximately half of the total amount. Over 100,000,000 more were cut this year, increasing the value of British Columbia shingles by $103,000. Over one-quarter of the shingles are manufactured in Quebec, where the 539,320,000 feet reported was an increase of 201,052,000, or 60 per cent. over 1909.

Nova Scotia increased its output by some 2,800,000, while the amounts reported from New Brunswick, Ontario, Alberta and Manitoba are considerably less than in 1909. Saskatchewan increased its cut of 50,000 in 1909 to 16,609,000 in 1910 and consequently is raised to sixth position in the table.

The price of shingles seems to be gradually becoming less. The 1910 price of $1.80 per thousand is six cents less than in 1909, which in turn was 21 cents under the price paid in 1908.

In 1909 the shingle output of United States mills was worth $30,000,000, or $2.03 per thousand.

Ten species are used in Canada, of which cedar is the great shingle wood. 1,817,995,000 or 93.5 per cent. of the shingles cut in Canada were cedar; probably about one-half of these were of western cedar cut in British Columbia. The consumption of spruce and white pine as shingle wood has decreased suddenly in 1910; 255,650,000 or 82 per cent. less of the former being used than in 1909, and scarcely one-fifth the usual amount of white pine being consumed. Nova Scotia and Quebec cut most of the spruce shingles. Pinus Monticola makes up most of the white pine and is cut in British Columbia. Nearly 3,000,000 more of hemlock were used in 1910 than during 1909. Of the total amount 14,866,000, over nine-tenths were cut in Ontario and Quebec.

Production of Lath

Lath to the number of 851,953.000 pieces were manufactured in Canada in 1910, worth $1,943,544,000, an increase of 29,829,000 pieces or three per cent., but a decrease in value of $35,490. Two-fifths of the total is cut in Ontario which increased its cut over 1909 by 56,692,000, or nearly 20 per cent. New Brunswick, by cutting 62,597,000 more than last yer, increased its proportion of the total from one-fifth to one-quarter. The cuts in Quebec and British Columbia during 1910 were considerably more than in 1909 and this year Prince Edward Island is in a true relation to the other provinces.

In 1910 the average price of laths was $2.28, 18 cents less than in 1909 and 7 cents more than in 1908. The price in the various provinces fluctuated over one dollar; in British Columbia it was $1.66 and in Prince Edward Island the price was $2.67.

Four additional species of wood were reported this year for lath—red pine, yellow pine, basswood and larch. Spruce and white pine, the two most important species for lath, show in 1910 a decrease but together form nearly 70 per cent. of the annual output. Some million and a half more pieces of cedar were cut this year. The principal gain was with Douglas fir, hemlock, balsam, and jack pine, which increased from 14,000,000 to 29,000,000 pieces each. In percentage of the total these four species nearly doubled their 1909 importance.

Prices ranged from $1.25 for yellow pine to $3.18 for poplar.

Sash and Door Manufacturers Busy

Building Activity Results in Plenty of Orders—Winter Outlook Excellent—Wages Higher than Last Year

The sash and door manufacturers of Ontario have enjoyed, during the present year, a welcome return of trade activity and are entering upon the winter season with a more encouraging outlook than they have had for some seasons back. Being so closely connected with the building trade, it is natural to expect that in a large measure the sash and door manufacturers will reflect in their own trade the conditions which exist in the building business. During 1911 building activity in Ontario, and in fact in every part of Canada, with but few unimportant exceptions, has been making new records and as a result the sash and door manufacturers have been unusually busy. They are at present, in almost every instance, filled with orders which will carry them well into the winter and the prospects are that business will continue for some time on the same satisfactory basis. The only unsatisfactory condition has been the scarcity of skilled labor and even unskilled labor has been hard to find in sufficient quantities. This had resulted in an increase of the cost of labor which varies from 5 to 10 per cent.

The opinions of the sash and door manufacturers upon trade conditions are well outlined in a number of letters received recently in reply to enquiries addressed to a number of the largest manufacturers in Ontario.

A typical reply says:—"Business to-day compared with a year ago is a great deal better. We are doing all we can and have all the business we can attend to. The outlook for trade is very bright."

Three-quarters of the replies stated that business was better than it was a year ago. One reports that it is better than ever. Another finds it improved to the extent of 10 per cent. Still another says that he has had 30 per cent. more business than a year ago and another places the increase at 40 per cent. Of those who do not report an improvement only one states that business is duller than it was a year ago. But he believes that the outlook is good. One report states that the business in doors is not so good as it was a year ago. Another finds that business in general is about the same as last year. One firm finds that although the volume of business has been steadily increasing, the profits are smaller on account of the increased cost of labor and materials and also because selling prices have not advanced proportionately with the increased cost of labor and materials.

Referring to the outlook everyone reports that it is good. Many do not stop simply at stating that the outlook is "good." One report says that the outlook is "very bright." Another manufacturer finds it "brighter than at any time." "Much better than a year ago," says another. A well known manufacturer reports as follows:—"the outlook for trade is fine—we have enough work ahead at present to run away into the winter." "We think the outlook is extra good" says another. A well known furniture manufacturing firm says:—"since reciprocity was settled there appears to be another solid boom."

The third question asked was as to the cost of operation. Four firms report that it is about the same as a year ago. Several report an increase of from 5 to 10 per cent. One firm in Northern Ontario says that the costs of operation have increased "owing to the awful famine of skilled and unskilled labor."

Working hours and wages will probably continue unchanged this winter. None of the firms reporting intend to make any changes in wages. One firm reports its intention of making the usual reduction in the hours of work to eight hours a day on account of the cold weather and short daylight. Another firm reports that it intends to run full time, ten hours a day.

The enquiries made by the Canada Lumberman also dealt with the wages paid to the various classes of workmen at present. Summing up the replies under this head the following schedule of wages is secured; carpenters 20 to 25 cents per hour; bench hands 25 to 35 cents per hour; carpenter apprentices 10 to 25 cents per hour; machine hands 20 to 40 cents per hour; sticker and planer hands 20 to 40 cents per hour; teamsters and laborers 15 to 25 cents per hour.

These figures represent the outside range of wages reported by all the firms. In most cases the actual wages reported are about ten per cent. above those of a year ago.

Canada's Exports and Imports of Lumber

Canada's exports of forest products for the 12 months ending July, 1911, were valued at $42,992,252. In 1910 the value was $48,455,654. In 1909 and 1908 the values were $41,112,588 and $42,810,151 respectively. For the month of June, 1911, the imports of lumber and timber, planks, boards, etc., into Canada free of duty were valued at $1,074,038, as compared with $1,020,698 for the month of June, 1910. Similar imports of a dutiable nature for the month of June, 1911, were valued at $60,979, and for June, 1910, at $30,704. For the three months ending June, 1911, the free imports of lumber, timber, planks, boards, etc., were valued at $2,958,830. For the same period of 1910 and 1909 the imports were valued at $2,460,352, and $1,524,039 respectively. Total imports of wood and manufacturers of wood for the month of June, 1911, were valued at $1,894,316, as compared with $1,625,723 for the month of June, 1910. For the three months ending June the totals were as follows:—1911, $5,195,892; 1910, $4,260,052; 1910, $2,903,347.

The Competition of Southern Pine

Objections of Hemlock Men Criticized by a Yellow Pine Dealer—Analysis of Situation from Another Viewpoint

Toronto, Oct. 11, 1911.

Editor Canada Lumberman,—I have followed, with interest, the discussion as to consumption of yellow pine in Canada, as it appears in the Canada Lumberman, and it surprises me, the statements some persons will make, to uphold their argument.

Now the manufacturers are opposed to the use of yellow pine, and I do not blame them, but why the dealer should oppose it, is beyond my comprehension.

Some statements to the contrary, yellow pine is not displacing hemlock, in ordinary boards and joists, it is being used extensively, but not in place of hemlock, but in place of norway pine and spruce, but if such a thing should happen, as a prohibitive tariff being put on yellow pine, it would not be long until the dealer would have to pay as much for hemlock as he now pays for yellow pine, and in that way, they may claim it competes with hemlock. But I do not think any person will agree that this would be a good thing, except the manufacturer, as if it was, they may as well argue that a combine to raise the price 50 per cent. would be good for the trade, which I do not think any person will admit.

I notice one statement, that 2 x 6 in. and 8 in., No. 1 Com. Georgia pine can be bought at $19.50, and 1 x 10 in., No. 1 Com. at the same price. I dispute this. Some irresponsible party may have offered it at this price, I will not dispute that, but I am willing to bet that the goods are not delivered.

I sold, last year, over $200,000 worth of yellow pine, and my sales to date this year, exceed last year, and I cannot sell at any such prices, and I have to meet competition. The lowest price at which I can sell 1 x 10 in. delivered Toronto, is $24 dressed one side, and this is 13-16 in., which is American standard, and very few will buy it here, or rough at $25.50. Quite a difference between this and $19.50.

The fact of this matter is, that the demand cannot be supplied, for suitable construction timber, without using yellow pine, or fir, which is considerably more expensive, on account of freight.

Now the exports to the States increase each year, and that is put down to natural increase in business. The imports into Canada increase, and of course, it is attributed to the Americans "dumping."

The exports to the States decreased last year. The reason for that is, that it was a very bad business year, on that side of the line, and this same fact accounts for the decrease in average price of goods imported into Canada. Of course a person who is interested will say that in spite of this fact, they should still maintain prices, but we do not have to look far to see a parallel case here. A few years ago hemlock was selling considerably higher than at present, but when the panic struck the country, prices dropped more than yellow pine prices have done, as some dealers know to their cost.

Now here are two extracts from one of your articles, which I do not see how any sane man can reconcile.

"The situation is aggravated by the fact that in many cases the architects who are engaged for large business buildings in Canada are Americans. Much United States capital is being invested in Canada in branch factories and warehouses, and the American architects employed naturally specify southern pine."

"It will naturally occur to the enquirer to ask why it is that our woods can sell in the United States in successful competition with yellow pine when they cannot do so in Canada. The answer is that in the Eastern States the inflammable nature of yellow pine is so generally feared that it is greatly handicapped, and architects and builders, knowing the safer nature of Canadian woods, specify them in preference to the yellow pine."

All the manufacturers appear to have made money in recent years, and they should not judge the dealer too harshly who uses the wood on which he can make the most profit. There is lots of business for all.

Yours truly,
A Yellow Pine Dealer.

Rapid Erection of a Modern Saw Mill

Extensive Plant of Shevlin-Clarke Company Limited, at Fort Frances, Ont. Constructed in 104 Days—Description of Building and Machinery

New Mill of the Shevlin-Clarke Company, at Fort Frances, Ont.

It took just one hundred and four days to break ground, complete the building, install the machinery and start manufacturing lumber in the large mill of the Shevlin-Clarke Company, Limited, Fort Frances, Ont.

Considering the size of the mill this record is one of which all concerned may be justly proud. Remarkable, too, is the fact that so perfectly constructed were all the machines that after starting not an adjustment was necessary and the mill turned the logs into lumber without a hitch or delay of any kind.

Besides the sawmill, in separate buildings there are an extensive planing mill plant, a machine shop, blacksmith shop, oil house, engine and boiler house, offices and dwellings for officials and men. The engine and boiler house and oil house are of brick and concrete construction.

Besides having all buildings equipped with a sprinkler system, there are water tanks, pails, extinguishers, hydrants and fire hose liberally distributed about the various buildings and yards, and a fire brigade, under competent leaders, has been organized.

The owners of the mill have taken every precaution to protect their employees from injury in the machinery. Every chain, gear, sprocket and belt is covered with metal guards, while the saws and chain belts have protectors devised to prevent any one falling into or getting in contact with them through carelessness. Visitors, too, have had their interests provided for, for, through the big mill there is an overhead gallery running its entire length, from which point of vantage every operation on the sawing floor can be clearly seen.

The frame work and heavy timbers of the mill are built of fir brought from British Columbia. The floorings are substantial and have been carefully laid. A visitor is immediately impressed with the excellent appearance of the whole building. It is painted red outside with white trimmings, and the white corrugated iron roofing adds to the general appearance. The entire interior is painted white, which, with the many glass skylights and windows, adds to the brightness. Incandescent electric lamps are scattered about the roof and rafters, and at points where needed through the mill, and when the current is on these turn night into day with their blaze of light. Electricity is generated by two dynamos. One of 50 kilowatts, supplies current for the big sawmill exclusively, while the second, 30 kilowatt machine, does duty for the planing mill, yards, office buildings, club, men's sleeping quarters and dining hall.

The number of men employed when the full staff is on the pay roll, will be between 350 and 400, working night and day shifts.

To Joseph Dion is due much credit for the successful result of the building operations. Mr. Dion was in charge in behalf of the designers, and carried out the construction and plans in such a manner as to win not only the approval of his principals, but, as well, the confidence of the large staff under him. No serious accident occurred during the work. Added to this the fact that the equipment was efficient to a degree, he turns over, on behalf of the engineers and designers, a perfect work.

The designers and engineers were W. A. Wilkinson & Son, of Minneapolis, who have designed and supervised the erection of many mills in Canada and the United States.

The Planing Mill

The planing mill is in a separate building. It is also equipped with the latest machinery, and labor saving, including roller wagons, surfacers, matchers, siding saws, rip-saws, resaws, and the other equipment necessary to an up-to-date plant.

The machine shop is large and roomy and the machine tools indicate a modern plant. All nuts, bolts, screws and similar articles for the big structure were made in this shop, affording saving of time and expense, the equipment includes machine planer, thread and nut cutters, shaper, lathes, automatic hack saws, punches and chears, steam trip hammer. Double forges are included in the equipment. This portion of the works is aimed to provide repairs for many, and perhaps all, of the breakdowns which may occur.

The refuse burner is a mammoth one, as may be judged from the general view of the plant published herewith.

The office building is one and one-half storeys high, 50 x 58 feet. On the lower floor are the general and private offices of the executive. The upper floor is set apart for sleeping quarters for the officials who have not passed from bachelorhood. The building formerly used for the same purposes is to be "The Club," where those holding responsible positions may spend their evenings and leisure moments. A portion of this building, which is located on the opposite side of the plant from the new main office building, will also have bachelor quarters, and the house-keeping apartments.

Near the company's premises outside interests have erected a large modern boarding house for the convenience of the men who prefer to reside outside the premises of the company. The men's quarters, sleeping, dining and recreation, have been constructed with full consideration to the fitness of things generally.

The yard accommodation is planned on a large scale. The piling ground being naturally level, no grading was necessary, and the clearing of the scrub bush was not a difficult task. Through the yards run two Canadian Northern Railway tracks. The railway siding at the planing mill has accommodation for twenty-two cars; one of the tracks running through the centre of the yard.

Splendid Equipment of Plant

The equipment for the sawmill was furnished by the Diamond Iron Works, of Minneapolis, Minn., who devote their entire attention to the manufacture of modern sawmill machinery. The mill equipment consists of two eight-foot band mills, three edgers, and an eight-foot horizontal resaw.

The mill is replete with automatic and special machinery. The eight-foot horizontal band resaw installed in this mill has all the improvements gained from long experience. This machine has proved a great success from the start and the Diamond Iron Works report that it is unique in the fact that it is the first and only horizontal resaw with wheels eight feet in diameter operating in Canada.

The main feature is the large diameter of wheels, allowing a 14 gauge saw to be used, which stands up to a heavy feed, and as the saw is in the cut at all times it gives the machine a capacity of 50,000 feet per ten-hour day, and owing to the fact that it does not require high priced help, the cost of manufacturing lumber is greatly reduced. In the mill are two eight-foot single cutting band mills of heavy design, the base of each machine is cast in one piece and extends entirely around the machine, giving greater spread to the foundation and a central support to the weight, thus eliminating all vibration. The machines have a full sweep gravity tension which maintains a uniform strain on the saw at all times and is so sensi-

The Shevlin-Clarke Company's Mill on the day of Starting Operations tive that it compensates for the slightest variation in the saw blade. By the use of this full sweep tension, saws can be changed and the machines back in the cut in less than two minutes' time.

The top guides are of the yielding pattern, and will swing up out of the way if struck by a log, thus preventing breakage. They are raised and lowered by means of steam cylinder with the operating lever in easy reach of the tail sawyer.

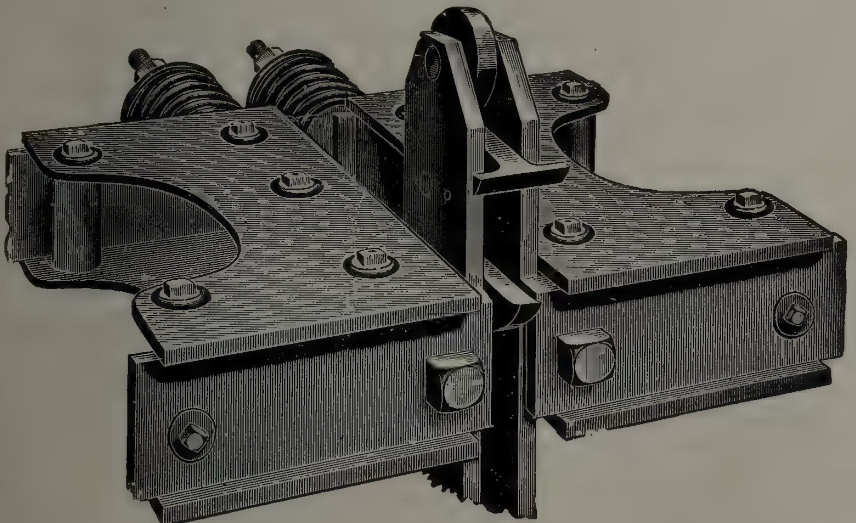
Another prominent machine is the Big Diamond combination bull and edger, which has a cluster of saws for making dimension stock from cants in connection with the standard machine. The cluster of saws have an independent variable feed and independent swinging press rolls supported by extra heavy intermediate bearings.

Type of Diamond Friction Clutch Pulley, installed in Shevlin-Clarke Mill

Other features are the Diamond Nigger Bar Cushion which takes the place of the ordinary floor plate, and permits the nigger to be operated with more freedom and greater rapidity, and without damage to the bar. It can readily be seen that a device of this kind is very desirable, as, in operating a nigger without one, the mill is liable to a shut-down due to the breaking of the bar.

The Diamond Lever Guard is claimed to be the only device made that protects the steam feed lever and the sawyer in case of accident. The sawyer knowing that he is thoroughly protected will give his entire attention to the rapid and accurate operation of the carriage, which improves the grade of lumber and increases the cut.

The main feature of the Diamond Hog is the overhead feed and the angle of the cut. The advantage in having the spout opening on top is the fact that the stock forces the feed with its own weight, giving the machine a greater capacity and making it practically impossible to choke up. The disc knives shear across the anvil knives at an angle making a clean cut against the grain of the wood, and thus eliminating any possibility of long slivers passing through the machine.



Diamond Nigger Bar and Cushion, installed in Shevlin-Clarke Mill

Every machine throughout the mill is driven by a Diamond Friction Clutch Pulley, so that they can be stopped independently of the balance of the machinery. This clutch is of extra heavy design for sawmill use, and is especially adapted to start and stop gangs, band mills, trimmers, edgers, slashers, electric and mining machinery, etc. The remarkable success of this clutch is due to its strength, simplicity, and ease of operation.

Shevlin-Clarke Company, Limited, is an international organization of well-known lumbermen. The officers of the company are: President, T. L. Shevlin, Minneapolis, Minn.; vice-president, James A. Mathieu, Rainy River, Ont.; secretary, George S. Eddy, Minneapolis, Minn.; treasurer, E. L. Carpenter, Minneapolis, Minn.; auditor, Wm. J. Lau; manager, George Beckwith; cashier, Maurice A. Malone; consulting engineers, W. A. Wilkinson & Son, Minneapolis; superintendent of sawmill, P. S. Dainert; superintendent of planing mill, yards and shipping, James H. Foss.

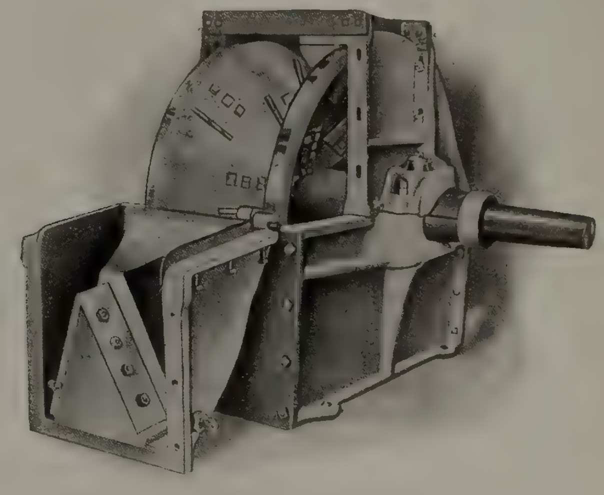
Secretary Anstie Explains Recent Meeting

The reports of the recent meeting of the Coast and Mountain Lumbermen's Associations at Calgary, which recently appeared in the press have given rise to a very mistaken view of the actual result of the meeting. Secretary W. A. Anstie of the Mountain Lumbermen's Association in an interview says:—

"It is a matter of great regret to me that I was unable to meet representatives of the press after the meeting and give a correct report of what transpired for the information of the public, as a wrong impression has been created which may be detrimental to the interests of the lumber industry.

"It is absolutely ridiculous to say that there is contemplated or that any central form of control is practicable or possible, which would permit of the undue enhancing of prices for lumber, and exploitation of consumers. I maintain, and am prepared to prove, if necessary, that there is more competition in the sale of lumber and also that it is generally sold by the manufacturers on the narrowest margin of profit of any natural product marketed in this country.

Now with regard to the report that a centralization of the entire selling departments of all the coast and mountain mills had been decided upon. I must emphatically deny that any such action was either contemplated or taken. The facts are that a number of the mountain mills whose geographical location and the nature of whose product would permit of their jointly marketing their lumber to better advantage through one organization than individually are considering the advisability of amalgamating for this purpose. This matter has not been definitely settled yet, but, in view of the economy which could be secured, I am in hopes that it may be successfully consummated before the first of the year. The production of the mills affected does not represent 20 per cent. of the source of supply of lumber for the prairie provinces, and in no sense could such a course be termed a combination in restraint of trade.



Diamond Hog installed in Shevlin-Clarke mill

"I think some reference was made to the number of travelling salesmen whose services would be dispensed with, the report stating that two hundred would be eliminated. If this plan should be adopted the selling force would not be reduced by more than twenty or thirty-five.

"With regard to American competition, it is quite true that the B. C. manufacturers are concerned, and justly so. For the past two years the lumber manufacturers of the western states, whose home market has been in a most deplorable condition, have been dumping their surplus product, principally the lower grades, which are unprotected, in the Canadian prairie provinces. The United States is closed to Canadian manufacturers by a protective tariff on all grades of lumber, and it is unfair that we should be at the mercy of their dumping tactics without having the right to retaliate. In the past the manufacturers of B. C. have represented this condition to the government at Ottawa, but without securing relief. Whether or not they will renew their efforts I am not prepared to say just now, but I think we should do so. I can say, however, that no action was taken regarding this question at the last meeting, as reported in the Calgary papers."

Maritime Operators Will Curtail Cut

Reports from Many Parts of N. B. and N. S. Indicate Probability of Reduced Output this Winter—A Better Feeling Prevailing in the Markets

Fredericton, Oct. 23:—The reduction of winter logging operations which is anticipated in many parts of New Brunswick this year is likely to occur also on the Upper St. John River on the Maine side of the boundary, according to latest reports. Some reports place the probable reduction in this district at as high as 70 per cent. It is not unlikely however, that as the season advances, various influences will tend to make the reduction considerably smaller than this.

The principal reason for the curtailment is the unsatisfactory state of the new York market which has been off all season. The general demand for lumber in the American market is dull and the mills will naturally not want to manufacture so much lumber with poor marketing prospects. Then again the operators on the St. John river and in other Aroostook county waters had a great many of their logs hung up on the drives, owing to the low pitch of water that came earlier than usual, and were unable to get them to the mills. It is estimated that over 10,000,000 feet of logs were held up by the low water.

One of the operators in Northern Maine is Arthur J. Nobles of Fredericton. He will operate on the Upper St. John river above Seven Islands and will cut about three million feet for the Stetson-Cutler Company, who will cut in all about 10 million feet on the Maine side of the river to go to their mills at St. John.

Albert M. Currie, of Seven Islands, an operator for the Stetson-Cutler Company, have an operation in the vicinity of Seven Islands and will cut about 3,000,000 feet to go down the river to St. John.

Nazarre Pellitier of St. Francis will cut less than a million feet for the Stetson-Cutler Company on the St. John this season. He estimates that he will take out in the vicinity of 700,000 feet.

W. H. Cunliffe's Sons of Fort Kent, operators for the Stetson-Cutler Company, will have an operation on the Allagash in the vicinity of Long Lake, and will cut about 3,000,000.

The St. John Lumber Company of Van Buren, which has usually handled from 40,000,000 to 45,000,000 feet of lumber in the season will cut about 14,000,000 feet this year. Quite a number of the St. John Lumber Company's logs were held up on the drive by low water.

Joseph T. Mishou of Houlton who operates for the St. John Lumber Company, of Van Buren, is to cut in the vicinity of 5,000,000 feet for that concern on the Upper Allagash waters.

Robert J. Potts, of Hartland N. B., and formerly of Fredericton, another operator for the St. John Lumber Company, has an operation on Big Black, a tributary of the St. John River, and he will cut 3,000,000 feet.

Flavien Chouinard of St. Pamphile is also operating on the Big Black, and he will get out about 2,000,000 feet for the St. John Lumber Company.

Charles E. Jones of St. Francis is also operating for the St. John Lumber Company, and will take out about 1,500,000 feet on the Little Black.

The St. John Lumber Company has an operation of its own on the Little Black, where it will cut in the neighborhood of 2,000,000, making a total in all of about 13,500,000 feet which that company will handle this season.

The Ashland Company, which has a mill at Ashland, Me., and for whom local lumbermen have carried on operations in past seasons, will operate on the Aroostook river, and will probably cut from 4,000,000 to 5,000,000 feet. This concern usually harvests from 25,000,000 to 30,000,000 feet of lumber in a season, but a great many of its logs like those on the St. John, were hung up last season.

The bulk of the cut in that section will be less than 28,000,000 feet this season, while in an ordinary year there is anywhere from 75,000,000 to 100,000,000 feet cut.

Better Outlook for Trade

I. C. Prescott, Albert, N. B., referring to the present condition and outlook of the lumber industry reports as follows:—I believe the outlook is better than it has been for some months. As a matter of fact the past season has been a poor one for the lumbermen, generally. The spring of 1911 was the poorest one for river driving that I have ever seen, and a great many logs were hung up in the streams. Prices for deals were good in the early winter months, but in March and April they took a slump and you could hardly give them away. There is still not much change in those conditions. I believe, however, that a better feeling prevails now and as trade improves in the old land, it will improve here. There is one fact, however, that lumber manufacturers should not lose sight of, and that is the amount of sawn lumber and logs that will be held over until 1912. This lumber will in all probability, be ready to ship next summer and in order not to glut the market, care should be taken not to cut too many logs this coming winter. The United States market for lumber has been very poor this season, also, but it is brightening up a bit now. Our own local market seems to be the only one that has not been affected, and prices have been fully as good as they were in 1910.

Of course the Maritime Province lumbermen look upon Great Britain as their best market.

Reduced Operations on the Oromocto

St. John, N. B., Oct. 18:—J. P. Wetmore, manager of the Oromocto Lumber Company, Limited, reports that the lumber cut on the Oromocto river this winter will not be half as large as last winter. "The operations of the Oromocto Lumber Company this year were very much larger than usual," he said, "but the manufactured lumber has been piled and still remains in the yards."

In reference to the British market, he says: "The Baltic supply has always to be considered, for that territory has many advantages over Canada in the British market. The present slack will give British merchants a chance to get rid of their stocks which have been accumulating for years and it may in the long run prove to be of advantage.

"The fall rains may bring down considerable lumber which was hung up in Shin Creek, a tributary of the South Oromocto. Our company was caught with about half a million, and the L. B. Smith Company also had a drive of the same dimensions hung there. L. B. Smith has lately been cruising on the South Oromocto and he may start an operation in that vicinity. D. B. Smith, who has his headquarters at Oromocto, has already several parties in the woods preparatory to a fair-sized operation."

Randolph and Baker Will Curtail Slightly

Mr. A. F. Randolph, of the firm of Randolph & Baker, St. John, N. B., has recently been making arrangements in the northern part of New Brunswick, for his company's winter operations. He reports that the company will make a slight reduction in the amount of their cut, and that they will take out about 14,000,000 feet. Mr. Randolph also reports that from his observations he expects a considerable curtailment in the timber cut on the upper St. John this year. Similar reports came from the State of Maine. It is stated that in the eastern part of the state a curtailment of from 25 to 40 per cent. will be made on account of the unsatisfactory condition of the United States markets.

Dry Weather Affecting the Output

The American market is reported to be in a very bad shape just now, with the exception of laths, which were also dull, but have taken a spurt up lately, and are selling now at $3.50, delivered in New York, says "The Maritime Merchant." The hemlock market is very stagnant at the present time. Long spruce would command a good price, but unfortunately there is not much lumber of this call to ship. The English market has not yet recovered from the effects of the strike and things are not in a very good state over there. Another thing that militates against the lumber trade with the British market just now is the heavy demand for ocean freights, which has resulted in putting up the rates. This movement is very general and it affects us in the Maritime Provinces particularly on account of the large apple shipments that have to be cared for just now. In the course of a month of two things will improve on the other side. It is early yet to forecast much about local operations during the coming winter, but we are told that lumber people are not making preparations for as large a cut as usual. It seems that there are large quantities of logs held over from last winter in the woods that could not be got out on account of the dry weather. As one man in the trade expressed it, we have had no rain to speak of for a year. The pulp industry is also suffering on account of the dry weather. We are told that none of the pulp mills are working at the present time on this account and that no matter how good the pulp market might be it would do us no good as we have no pulp to sell.

One lumber operator on the St. John River and another on the Miramichi state that their cut of logs this winter will be only half as large as that of last year. Other operators also state that the general cut will be reduced. Should the season prove very favorable, however, it is generally found that the log cut turns out larger than the autumn predictions would seem to indicate. Beyond question, however, there will be a largely reduced cut this year.

The Penobscott Lumber Company have decided to greatly curtail their cut this winter. The total operations this year will be about seven millions. On one section of their property alone last year the cut was more than eight millions. The company, whose head office is in Maine, operate along the great Salmon River district in New Brunswick.

James Robinson, of Millerton, N. B., reports that the lumber market is very dull, and the winter's cut will be curtailed by half. A large stock of last year's lumber is still on hand, and the operation of the present year will be reduced to facilitate the disposal of the old stock.

An Eastern View of U. S. Competition

In an editorial dealing with a recent article published in the "Canada Lumberman," regarding the necessity for a duty upon rough lumber entering Canada, "The Maritime Merchant" says:—"We do not know the general feeling in the lumber trade of Canada regarding the value of reciprocity. Some prominent interests, we know, were against it, while others were in favor of it. We would gather from the Canada Lumberman's article, however, that the lumbermen would not so much mind the influx of American lumber into Canada if they had a fair chance to send their produce into the United States, in which country the duty is $1.25 per thousand upon rough lumber, while American lumber of certain descriptions pays no duty on coming into Canada. It would seem that many customs officials in Canada are not very strict in exacting such duties as we impose on American lumber, being careless about classifying the imports properly. This, of course, is a trouble which careful customs inspection would rectify, but many of the lumbermen feel that they are entitled to a fuller protection than they get. There is no doubt that imports of lumber from the United States have been growing, whatever that may signify. In boards, deals, planks, joists and scantlings, the imports into Canada from the States since 1909 advanced from 127,000,000 feet B. M. to 403,285,000 feet. In the same period our exports to the States amounted to only 18,389,000 feet more in 1911 than in 1909. The average value of the lumber imported declined from $26.09 per m. to $22.97. In 1909 the American duty was reduced from $2.00 per m. to $1.25, or 75 cents, but in the same time the average value of our exports declined 49 cents. The lumbermen claim that this establishes a very good case for a Canadian duty. We are not aware that the competition of American lumber is felt in these eastern provinces. It is chiefly in the prairie provinces, we fancy, that the importations take place, and that is due to certain local conditions of supply."

Trade Conditions at River Hebert, N. S.

Editor Canada Lumberman:—The deal market in this district is fairly good, but owing to the ship laborers' strike in England the deal higer has been left at the present time without any chartered tonage. This will force the manufacturers who ship through the buyer to hold their stock until a late shipment and, when navigation closes, to hold stock over until next year.

The American market has not been very brisk and even at this late date the prices are not what they should be.

The local trade has been fairly good, the usual fall trade is about the same as last year.

It is too early to tell how much stock will be carried over until next spring. The prices have not been any better than last year, taking it all around the markets.—Kelly Bros.

A prominent mill owner and shipper in the Annapolis Valley, N. S., reports that the local trade has been exceptionally good during the present season. He also reports that the demand from the South American markets will warrant a cut during the coming winter, quite up to, if not a little greater than the average.

Spruce is going into the winter in strong strategic position. Stocks of mill random are light at all points in the northeast, in the Adirondacks, and in West Virginia, and as many mills in the two former sections have already cut out their season's supply and have closed down, while many of the winter mills will be out of the market for sawing dimension schedules by reason of failure of log drives, the outlook is for light production and a high range of values right through the winter, despite the fact that this metropolitan market is not, and will not, be a heavy buyer.—New York Lumberman's Review.

United States Lumber Statistics

The statistical department of the National Lumber Manufacturers' Association has issued its report for August, covering the lumber cut, shipments and stock on hand at the mills reporting.

The statistical department has been at work only three months, so that the result is by no means complete for the country, but the number of mills reporting is sufficient so that fair deductions can be drawn from the report.

On an annual basis the August figures represent about one-fifth of the entire output of the United States and a much larger proportion of the ordinary structural and market woods.

The report indicates that during August the output of the mills of the country was only 3½ per cent. greater than the shipments from the mills, and as in some sections the mills are expected to pile up stock during the summer months in preparation for the winter demand, it seems that in the aggregate nearly a normal condition has been reported.

But while the lumber producing industry as a whole seems to have been approximately adjusted to the demand, it is not true as to certain sections. The excess of shipments over cut, which brings about the result, is to be found chiefly in the south, where labor troubles have seriously interfered with the production. In Louisiana, for example, the output was 15½ per cent. below the shipments. In Alabama, Arkansas, Mississippi, Texas, Georgia and Florida, the stocks decreased in varying proportions.

Mine Timbers of Douglas Fir

In a report by Messrs. McGarvey Cline and J. B. Knapp, on the "Properties and Uses of Douglas Fir," published as Bulletin 88 of the U. S. Forest Service, it is stated that Douglas fir is used as a mine timber, both in the square and round forms, to a large extent in the western states. Squared mine timbers of Douglas fir also go to Pennsylvania and to foreign countries. It is frequently preferred to all other available species, because of its durability and strength, and because of the desirable sizes in which it may be obtained. Where a supply of this timber is at hand, it also goes largely into temporary work, such as lagging, sills, posts and caps. When it can not be conveniently procured, substitutes are frequently found in lodgepole pine and western yellow pine.

In the square form, Douglas fir has no competitor for shaft and tunnel timbers in regions where it is plentiful. Few of the large western miners use any other wood for that purpose, especially in permanent work. Its particular and most common use in the square form is for caps, sills, and posts in tunnels, and for square sets in stopes.

The round form of mining timber seems to be most common in Colorado, where the local species of Douglas fir, commonly called "red spruce," is used. Even in this region the coast fir is preferred for permanent work. In the southwestern section of the country, where western yellow pine is the prevailing local species, mine operators think that Douglas fir is much better, and they bring the square forms sometimes from a distance of more than 1,000 miles.

Both square and round timbers of Douglas fir are in some cases treated when used in permanent mine work. The treatment generally consists in impregnating the wood with creosote, but carbolineum and zinc chloride have been used. Round timbers are easily treated, because the soft sapwood readily absorbs the fluids. The wood should be peeled clean of bark before treatment. In the square form, the impregnating of Douglas fir with preservative fluids has never been entirely successful, because the density of the heartwood hinders the penetration of the preservative. Of late years, however, considerable progress has been made in developing a successful treatment of Douglas fir heartwood by the boiling process, followed by pressure. When treated with zinc chloride, a three per cent. solution is generally used. The timber is first steamed for the purpose of seasoning, and is then impregnated with the solution.

Appleton & Sewall Company, 156 Fifth avenue, New York, recently completed the survey and exploration of 50,000 acres of Maine timber lands on the Allegash River. This is one of the first detailed surveys to be made on that watershed, and of considerable importance as setting a high standard to be followed hereafter. The land in question was first surveyed into mile squares and then thoroughly explored for timber. Topography was arrived at by use of aneroid barometers in combination with lines of levels, and stadia traverses were made of the rivers and driveable streams as well as the roads.

The Retail Dealer and His Problems

Ready Roofing Riddles—Selling to the Consumer

Mists and Mysteries of Ready Roofing

How many retail lumber dealers who handle ready roofings know definitely what it is that they are delivering to their customers? It may not be necessary for them to know the actual material contents of ready roofing, but how many dealers know whether they are handing out a good weather proof material or just a nice looking covering for the roof which will not stand the test of time and the elements?

There is only one way for the retailer to know that he is giving roofing value in return for his customer's money. That way is to deal with responsible firms who have something at stake besides a mushroom office and a roll top desk. They should insist that the manufacturers take them thoroughly into their confidence as to the value of the goods and that they do not simply try to sell them on the ground of some alleged secret process of manufacturing or some other "talking point" which if the truth were known it would be better to say nothing about.

The extensive way in which retail lumber dealers have taken up the sale of ready roofings of late years has made this matter of direct importance to the trade. So important has it become, in fact, that recently the Northwestern Lumbermen's Association of Minneapolis, Min., decided to find out for themselves just where they stood: They appointed a committee consisting of John W. Barry, President of the Hawkeye Lumber and Coal Company, Cedar Rapids, Iowa, and W. G. Hollis, Secretary of the Northwestern Lumbermen's Association, who were assisted by Geo. Wilson-Jones, Secretary of the Illinois Lumber Dealers' Association. The duty of this committee was to visit the most important roofing factories in the United States and to learn all that they could about the manufacture and the materials used in making ready roofings.

After several months of careful investigation this committee has presented a report to the association which goes into the question in detail and from which retail lumber dealers will be able to gather information as to the important points in connection with ready roofing, which they themselves could not have secured by a whole life time of experience.

The committee first of all addressed a letter to the manufacturers whom they proposed to visit, setting out the object of their investigations and asking to be favored with their co-operation in making the results of the investigation thorough and practical. The letter was received with enthusiasm in nearly every case and the committee was received with open arms and afforded exceptional opportunities of securing the desired information. The letter referred to was sent to the following manufacturers:—Johns-Manville Co., T. F. Manville, president, 100 William street, New York city, N. Y.; J. A. & W. Bird, Boston, Mass.; H. F. Watson Co., Mr. Potter, manager, Erie, Pa.; Warren Chemical Company, 17 Battery Place, New York city, N. Y.; United Roofing Company, Philadelphia, Pa.; Philip Carey Manufacturing Company, Geo. Crabbs, president, Lockland, O.; General Roofing Manufacturing Company, Geo. M. Brown, president, East St. Louis, Ill.; Paraffine Paint Company, South Chicago, Ill.; Lehon Roofing Company, Chicago, Ill.; Barrett Manufacturing Company, Mr. Childs, vice-president and general manager, 17 Battery Place, New York city, N. Y.; Standard Paint Company, Ralph Shanewald, president, 100 William street, New York city, N. Y.; F. W. Bird & Son, East Walpole, Mass.; Keystone Roofing Manufacturing Company, York, Pa.; Ford Manufacturing Company, Chicago, Ill.; Patent Vulcanite Roofing Company, Mr. Glendenning, president, or Mr. Logan, manager, Chicago, Ill.; Barber Asphalt Company, Mr. Mack, president, or Mr. Powers, sales manager, Land Title Trust building, Philadelphia, Pa.; All Roofing Company, East St. Louis, Ill.; Mutual Rubber Roofing Company, East St. Louis, Ill.; The B. F. Nelson Manufacturing Company, Minneapolis, Minn.; Heppes Roofing Company, Chicago, Ill.; Chatfield & Woods Company, Cincinnati, O.; Lincoln Waterproof Cloth Company, Boundbrook, N. J.; Usona Manufacturing Company, Aurora, Ill.

The report is in part as follows:—

"Don't take yourself too seriously, in the matter of being the commercial chaperone of your customers. Too many retail lumbermen, honestly believing that in the long run, everything considered, good shingles make the best and most economical roof covering, have systematically discouraged the sale of prepared roofings, with the net result of giving the mail order houses an opportunity which they have eagerly grasped, of building up their enormous trade in this commodity. These modern merchants cater to the public demand. They sell the people what they want. Why not the retail lumbermen? Persistent advertising by the manufacturers, jobbers, and the catalogue houses which have been the largest individual distributors, has made prepared roofings a staple. This being the case, what does the average retail lumberman know about this commodity, how it is made, of what materials it is composed, and the comparative merit and value of the thousand and one brands which are urged upon him, each claiming qualities and virtues not possessed by any other? The answer in plain English is Nothing.

The All Wool Argument

"The import duty under the McKinley law was ten cents a pound, and under the present law is six cents a pound on wool rags. Under date of April 20, The Paper Trade Journal gives the market price of the best grade of roofing felt rags as seventy-five cents to eighty cents a 100 pounds. Compare with the import duty on wool rags of $6 a 100 pounds for a faint suggestion why wool rags are not used in roofing. It must not be assumed that the absence of wool from felt is a detriment. On the contrary the proper kind of cotton fibre makes a better felt for roofing.

"For every ton of felt two tons of coal are required, even when every modern mechanical contrivance is used, and in the more poorly equipped plants more power in proportion to output is required. Labor is the second item in felt production, being $2.93 a ton. In the most efficient plants, the minimum cost of production exclusive of the rags, is about $11 a ton.

"Building papers are made in the same way and on the same machines as the roofing felts. While the papers are made in the same way as the roofing felts, they are not made from the same kind of stock. Building paper stock is old paper, the harder cotton rags, bagging and in general the class of rags that make hard product not adapted to take saturation.

"Some manufacturers have urged that the solid papers are better than the filled papers. The truth is there is no difference. Tear a piece of red rosin paper; if red through it is "solid," but if red only on the outside it is "filled." Whether filled or unfilled papers are produced, depends entirely on having a machine with three or more forming cylinders, and there is no difference in the quality of the paper. The color in a ton of red paper costs from about $1.50 to $2. In other words, building papers, if made without color, would sell for about $2 a ton less than at present. Will some dealer or some scientist please state of what use the color in paper is to building? On a twenty-ton car, this is $40 absolutely thrown away.

Some Mists and Mysteries

"While the making of the felt is by far the most expensive operation in the manufacture of ready roofing, yet no one now claims any secret process, but when it comes to the saturating and coating of the felt for roofing a few manufacturers still claim secret processes and special machines. In general such claims are matured rot with an odor that would fertilize the Bad Lands of Dakota. Any secret process roofing may justly be regarded as one made up of parts that builders would consider undesirable, if known —hence the secret. . . . It is time the manufacturers of ready roofings should realize that they are making a product as staple as shingles and further, that the retail dealers who sell and stand behind such roofings, are justly entitled to know as much about them as about shingles.

"There are two principal processes of roof making which may be called the single and the double process. Each machine has its "talking" points, just as one shingle machine has points not found in another, but each producing about the same product—so far as use on the roof is concerned.

Waterproofing Methods

"In addition to coke-tar, coal-gas-tar, water-gas-tar and other of the tars, there is a long list of water-proofing material which may be considered under the following heads:

1. Those extracted from non-metallic minerals as petroleum.
2. Those found in mines and in mineral lakes as solids and semi-solids.
3. Those made from animal fats and vegetable oils.

"No roofing manufacturer uses any one to the exclusion of all others—indeed, it would be wholly impractical to use any one alone in making ready roofing. Further, no one uses the same ingredients constantly or in the same proportions without variation.

"The question, "Is three-ply really more valuable than one-ply or two-ply " is often asked. . . . The coatings are usually the same, regardless of the ply of the roofing, therefore the greater value of the heavier weights is wholly in the larger quantities of asphalt they carry in the form of saturation in the felt itself.

"In the case of the asbestos, it is, of course, the asphalt that burns, leaving the asbestos fiber unburned. This, however, is hardly the right sort of test, as all these roofings may be described as "fire resisting" when laid on a roof. They will resist fire from large burning brands that may drop on them, and, being almost air-tight, they will often confine a fire within the building, but to say they are fire-proof would be untrue, for they will all burn under certain conditions. When it comes to resisting fire, the mineral surface roof and the asbestos roof are, of course, to be preferred. The insurance companies, after numerous tests, admit the various ready roofings as proper construction within the fire limits of cities, and regard them as much safer than shingles. Further, they are often more fire resisting than metal roofs, as they do not transmit the heat so rapidly as metal does. Fire under a composition roof melts the asphalt and makes the roof adhere to the boards, thus shutting out the air and smothering the flame. Fire under a metal roof makes the metal expand and bulge, thus making an open air space in which the fire burns more freely.

"The greatest difference between cost and material in the most expensive and the least expensive roofing does not exceed twenty-five cents a square. . . . The additional price on the dearer roofing is not represented by any apparent corresponding value in the roofing itself.

"As an additional safeguard a dealer should ask what the roofing is made of, by whom and where it is made. In the instance of the watch, if it bore an unknown or private brand and the dealer refused to tell him of what is was made or who made it, you would tell him to keep his watch. So with roofing, when refused specific information, the thing to do is to buy, directly or indirectly, from a manufacturer who is not afraid to tell of what his roofing is made. The principle of the pure food law could be applied to roofing with good results to all parties interested."

Wholesalers Selling to Consumers

Retailers Complain of Unfair Practice—Business Destroyed by Travellers Who Sell Direct to Contractors

The ethics of the lumber trade are many-sided, and although the wholesaler often complains of the business policies of his retail customers, the shoe is sometimes on the other foot. Complaints are by no means uncommon, on the part of retailers, that wholesalers go beyond them and sell lumber direct to consumers. One retailer in a letter to the Canada Lumberman says:—

I find the wholesale people have destroyed the retail lumber business. Any person who requires a car load of building material can get it just as cheap as the retailer can. Also several people will buy a car together and divide it. This leaves the retailer to sell at cost, especially in large lots, or not fill the larger orders. In other lines the same thing prevails.

The same evil is commented up vigorosuly by the Schultz Bros. Company, Limited, Brantford, Ont., in the following letter to the Canada Lumberman:—

We will attempt to show you how the unfair side of such transactions must appear to the legitimate retailer or supplier who has bought and stocked a full line of all kinds and sizes of material, summing up in value to say $75,000. Such a stock, of course, would not be required for a retail yard alone, but in this case all builders' supplies are manufactured and all standard mouldings and dressed stock, etc., are constantly on hand and such a complete variety of all classes of dry lumber gives the company the advantage to supply any and all classes of the best contract work calling for dry stock. This should be borne in mind, as all districts are not so well provided for in this way, but get their supplies from hand to mouth and in busy seasons have to be satisfied with green stock, besides having no guarantee of delivery, which often holds up contract work at great loss. The company referred to manufactures boxes, packing cases and shocks and several novelties, which side lines, independent of builders' supplies, use about one million feet per year.

We mention the above to show the amount of business enjoyed by the several wholesale men, all of whom get a civil reception and equal chance to sell stock; prices, grades and all other things being equal. This kind of fairness should be sufficient to satisfy the travelling man to encourage all those who are dependent upon and properly equipped to do retail business; not simply because they cannot always sell to those men, to call on the plasterers for lath orders and accidently get in touch with a number of contractors or direct users of building materials, considering it quite a prize to even get a small car order; even though they wanted a few door and window frames coupled with enough lath and shingles and a little cheap northern matched spruce flooring.

All of this kind of thing we cannot help, but we see it and even worse, plenty of it, too. There seems to be no protection for the retail lumberman, as any contractor can get his supplies, big or little, mixed or unmixed, sized or dressed. Good pay or bad, it makes no difference. There is no regard for the interests of those who certainly prove to be the largest, steadiest and best all-round-every-day-sure-pay-customers—the retail lumbermen.

Surely some practical understanding could be arrived at by which this can be overcome, if wholesalers and manufacturers would discontinue selling to every one who may write them for a price on a bill of material, and instead, refer them to the retail men of the section in which they propose to use material. This plan works well in the western provinces and we believe is a general rule in the American cities.

Only in this way can a high standard be maintained making good safe customers for the wholesale market.

We trust you may be able to make use of the above and that through the work of your journal some remedy may be launched for above conditions.

Yours truly

The Schultz Brothers Company, Limited.

Prospects of the Jobbing Planing Mill

What was once looked down upon as a forlorn hope and an expensive proposition in connection with the retail lumber business has lately become one of the best and most desirable undertakings in the woodworking world.

That thing which at one time was looked upon with suspicion by credit-rating people, and looked up carefully by wholesalers before the proprietor thereof was trusted with a few carloads of lumber, is the country or jobbing planing mill.

This industry has had a hard row to hoe for some cause or other and in times gone by has been known more as a money-loser than a money-maker. The tide has turned, however. To-day a modern jobbing planing-mill in a good locality is really a better thing than a lumber yard, notwithstanding the fact that the lumber-yard operators have long fought shy of running planing-mills.

It is pretty safe to say that during the past two years the planing-mill men have made better profits than the lumbermen and perhaps better than any other branch of machine woodworkers.

Planning and Running a Planing-mill

It must not be assumed from this that anybody can erect any planing-mill at any place and make money easily. It takes brains to run a planing-mill successfully and also requires a natural gift in that line. Those that have it, though, are making money to-day in the planing-mill business and there is perhaps no better calling that the young men starting out in life may follow than that of planing-mill work, of learning the business thoroughly with a view to entering into it in the future.

The amount of planing-mill work called for has increased not only with the increased population of the country, but also in its relation to the population. Moreover, it has broadened out in the scope of its work. Now a very good jobbing planing-mill includes not only the machinery necessary to get out frames and interior trim from solid wood, but also a veneering department for putting up veneered doors and panels for interior work. Often, too, there is included lots of cabinet work in the planing-mill.

One could elaborate to quite an extent on cabinet and furniture like work involved in getting out the interior trim for some of the modern apartment buildings, but the main subject in view right now is the planing-mill itself and the fact that it is at present in better shape than ever was known before.

Greater Scope of Mill-work

Part of the reason for this is in the increased scope of mill-work. A part of it is in the fact that lumber has become a more expensive article and the source of supply if farther away from the home builder. To get what he wants cut to special shape he must go to the planing-mill.

The awakening during the past few years to business methods and systematic accounting has in a way rejuvenated the planing-mill business has resulted in the planing mill men revising their mill cost and getting their estimates on a basis that insures them a reasonable profit.

They have found in this revision of the secrets of business, one of the good secrets, and that is that price alone has but little to do with influencing the quantity of millwork called for by the consumer. Of course, it does influence it a little, but it is such a minor factor that for all practical purposes it may be said that the planing-mills are able to get just as much work to do when charging a price for it that will leave them a fair margin of profit as they were when at the end of the year it was hard to bring the balance out on the right side of the ledger.—Wood Craft.

THE WOODWORKER

Snakes; or the Kink in the Rail

The snakes I have in mind are not the kind you kill with a stick, nor the kind acquired from a bottle, but the kind the mill man has to deal with.

The superintendent was feeling pretty peevish and said that such lumber was a disgrace to any mill. Also, he said that something would have to be done instanter, or words to that effect.

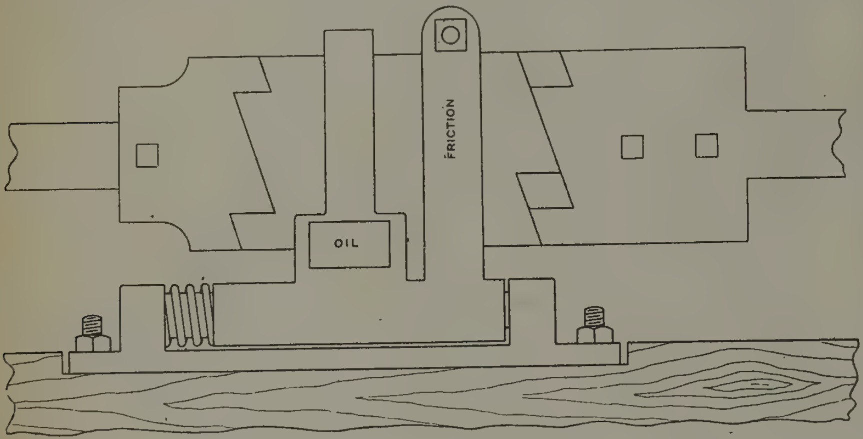
The main trouble seemed to be with the dog planks. They were thick at the ends and thin in the middle. The boards were a little snaky, but were generally fair.

The sawyer suggested that the saws were running into the log too much, so the filer hammered them out of the log a little. Result: bullheads, but the same dog plank.

As the filer declared that it was not the saws, because the rest of the lumber was good, the sawyer said it was not his fault, as he was particularly careful, and the setter was above reproach, it was up to the millwright.

It was observed that the thick part of the plank seemed to come in certain places, so that a short log had one thick end and 16-ft. logs had both ends thick, while logs that were carried over the front headblock would have the thick part back from the end.

Closer observation determined that the thick parts of the plank came over the offsets, so he—the millwright—took a day off and stretched a line along the edge of the "V"-rail. The result was that a kink was found where there was a joint of the rail opposite the saw. The carriage, of course, had to follow the trucks that had the offset, so that when the trucks passed over the joint the carriage was drawn away from the saw, and as the saw tried to follow a straight line, the result was a more or less regular board and the humps on the last plank or timber.



The Offset.

As the kink was short, two holes on each side of the joint were bored diagonally through the rail timber, so that the head of a bolt put through the hole from the outside would engage the edge of the rail, and tightening the nuts would draw the joint in line. The results were highly satisfactory.

Another time the front end of the board seemed to acquire a new style. Everything would be going along smoothly, then a board would come that was thin at the end. Maybe there would be two or three with thin ends, and then a thick end, or maybe one thin end and then a thick end. The thin end was wedge-shaped for about 20 in., and from there on the thickness ran normal.

Of course, the offset was blamed. The offset is composed of four principal parts. The principle is on the order of the spiral clutch; the two parts of the clutch are fast on the axle facing each other; but in between them is a sleeve that is loose on the axle, but fastened to the carriage by a collar that allows the sleeve to revolve but does not allow any end play. The ends of the sleeve form the other half of the spiral coupling to match the parts fast at both ends.

The operation is very simple. There is a friction on the sleeve that tends to keep it from revolving on the axle, but as the spirals on the opposite ends are in opposite directions and the end pieces are set so that the axle can make only part of a revolution without engaging the clutch, it is evident that the sleeve must follow the spiral endwise until the clutch engages. The sleeve being fast to the carriage by the collar, the carriage must follow. The carriage is shifted to the saw side when the axle revolves forward, and is pulled away when the axle runs backward.

It is evident that if there is too much slack between the end of the sleeve and the part that is fast on the axle, the sleeve can be shifted endwise without the axle revolving. It frequently happens that striking the log heavily with the nigger-bar will slip one end of the offset, leaving room for the sleeve to play endwise. As usual, the offset was examined, but it was tight. The filer pointed out that even if the saws were in bad shape they could not cut thick and thin on the front end.

The millwright was convinced that the trouble was in the offset, so when the mill shut down to change saws he took a lever and tried the carriage from one side then the other. He found by prying rather hard that the sleeve collar was loose enough so that the side motion of the offset would shift the carriage on the casting, and the saw would be in the log before it would settle back to place. A wrench vigorously applied was a quick cure.—The Woodworker.

Relation of the Lumberman to the Box Man

By W. L. Rice

When one uses the term "lumberman," the thought immediately occurs that it is that man who handles either by manufacturing or wholesaling or retailing, lumber, whereas I contend that a lumberman is a man who assists a forest product to reach its ultimate destination. Therefore, I will include as lumbermen the box manufacturers, the piano manufacturers, chair manufacturers and builders; for without these the man who manufacturers lumber from the stump cannot exist. What benefit to society is lumber? None, What benefit to society is a wharf full of mahogany logs? None. They must be manufactured into some article that the community can use that will benefit our present form of civilization before they have any value to advance our prosperity.

I do not remember the exact figures, but it occurs to me that it has been stated that 40 to 50 per cent. of all the lumber cut in the United States was transformed into a wooden package. Perhaps it is safe to estimate then, than 30 per cent. of all the lumber cut in the United States is cut into wooden boxes. Is not, then, the box maker essential to the life of the lumber manufacturer, and is not the lumber manufacturer essential to the life of the box manufacturer?

The Lumberman's View of the Box Man

It was my privilege a few years ago to attend a convention of one of the large hardwood manufacturing associations. The chief topic of discussion was the grading rules on certain classes of lumber, among them poplar. These people who were fighting and fighting hard for a more liberal construction of the rules were retail lumber dealers, men who simply moved the stock from the mills to the manufacturer who ultimately passed the finished product to the people. There was not one discussion by a man who manufactured this raw material into something useful, because they were not invited to be present at the association meeting, and neither were their opinions asked nor their opinions desired. The box maker has been considered by the lumber manufacturer in the past twenty years as that character of man who would be able to take anything that nobody else wanted and cut it into boxes. I say, gentlemen, the time has come when the economical features of manufacturing must be considered as a more potent factor in the conduct of our businessess; and the character of material that we attempt to put into boxes has a great weight with the cost.

A lumber manufacturer was in my office four days ago and had shipped me a carload of No. 3 common poplar. Among other things that this car contained was 1,200 feet of lumber which was bark edge. Some of the pieces were filled with bark. I had him come down and see the lumber, and his only excuse was that bark strips, if they were cut 25 per cent. clear cutting, were permissable in a No. 3 common board. Do you recognize what that means? It means that you pay for 100 feet of lumber and get 25 feet out of the board. If your price is $17 per 1,000. as ours is, delivered, then the lumber that you use costs you four times $17, or $68 per 1,000 feet. It requires just as much labor on the part of your mill men to cross-cut bark and throw it away, as for them to cross-cut the good lumber and turn out boxes; consequently your labor is four times as expensive as it should be on this class of lumber. Does the lumber man know this? No, he does not. Would he care if he did? No! Simply because the box manufacturer has allowed himself to be thought of as that character of individual who will take any grading that a lumber association wishes to foist upon him. The theories of grading lumber are too numerous and too technical for me to go into a discussion at this time, but I say to you that the theory of grading lumber should be influenced just as much by the box manufacturing industry as by the building trades. What is the remedy. Did you ever stand in a crowded street car and have a fat man stand on your toe? He was entirely unconscious of it until you very quickly told him; then he changed his position.

Should Get Together

I don't believe it is the idea or the theory of any reputable lumber manufacturing company to attempt to work a hardship upon any one who uses their product, but I say to you, how can they know they are working a hardship any more than the fat man in the trolley car, if you don't tell them. The box manufacturer very frequently might be able to assist the lumberman, but he don't do it. Why? Because they never get together.

Some months ago I had discussions with a pine manufacturer who was deploring the fact that he could not get a higher price for his low-grade lumber, and I told him directly why he could not get a higher price, and the reason is this: Boxes are used according to the amount of merchandise to be packed and shipped. The consumption of wooden boxes is not dependent upon advertising or upon personal tastes. The Gillette safety razor has had unprecedented sales because it has induced people to use a Gillette razor who have never used a razor before. But you can't get people to use boxes for the mere pleasure of being able to buy them. No amount of advertising, no amount of scheming, no amount of anything will make more boxes used than the merchandise shipped.

North Carolina pine used to grade 65 per cent. 3s. and better, and 35 per cent box. To-day the lumber that cuts 35 per cent. good grades is in the minority. This makes an overplus of low-grade lumber in comparison to the amount of lumber cut. In addition to this, some of the shook mills in the south have attempted to cut shooks from slabs. This also increases the low-grade production. A lot of mills in the south have commenced to manufacture shooks from their own low-grade lumber; the balance they were selling to northern markets for box factory use. The prices that they expected to get for their shooks are below a commensurate return for the investment; consequently there is a demoralization of the selling end of their business. They make money on the rough lumber they manufacture in shooks; they make no money on the shooks they manufacture, and they have decreased, by supplying part of the demand, the consumption of low-grade lumber in the northern markets. As an example, if A has an output of 10,000,000 feet of box lumber, and B buys this lumber from him to make into boxes and shooks in a northern market, then A decides to make shooks himself, and makes 5,000,000 feet of shooks; B's market is diminished to 5,000,000 feet, and also his buying capacity is diminished to 5,000,000 feet.

There has been a general reconstruction of theories of placing shooks on the market, but there has been no action to conserve the profits on the manufacturing of lumber into shooks. I do not expect to state that a shook manufacturer in the south has no rights; he has all the rights. What I do state, however, is that if this selfsame lumber manufacturer was present at our conventions and the box manufacturer and the shook manufacturer and the lumber manufacturer would come in close communion one with the other, their difficulties could be overcome. A proper and commensurate price could be had for all products without the interference of the present conditions of trade.

The lumber manufacturer doesn't want to put the box manufacturer out of business; neither does the box manufacturer want to put the lumber manufacturer out of business; they both need each other. The troubles of the box man are essentially the troubles of the lumberman, and these troubles I want pointed out to the lumberman. Some criticism was made some years ago against inviting lumbermen to be present at our convention and be members of our association. There was the fear that we would teach them the principles of box making and thus enable them to go into this much overcrowded industry. I say to you with all my strength, let's teach them, and when they know as much about the business as some of us know they won't touch it with a thousand foot pole. It's lack of knowledge that puts lumbermen in the shook business, and not acquisition of knowledge itself.

Wood-Using Industries in New Hampshire

The State of New Hampshire has entered into a co-operative agreement with the United States Department of Agriculture under which an exhaustive study of the wood-using industries of the Forest Service, and more than 700 New Hampshire manufacturers who use wood have been asked to furnish information. A major part of the timber cut in New Hampshire is used for general construction and for laths, railroad ties, poles, mine props, bridge timbers, and fence posts, but in addition a large quantity goes to meet the demands of the wood-using factories which convert material into commodities of many uses and many kinds. It is these factories which are to be studied in the New Hampshire investigation. Similar studies have been completed for other states—Massachusetts, Kentucky, Illinois, Maryland and others. One point which will be brought out by this study is the extent to which the forests of New Hampshire produce the woods used by the manufacturers, and the extent that their requirements have to be met from timber regions outside the State. In 1909 New Hampshire stood twenty-fourth among the lumber-producing States, but among the New England States it stood next to Maine. It is probable that New Hampshire holds a more important rank as a user of wood than it does in production.

Good Advice for Sawmill Insurers

Sawmill insurance is a matter of vital interest to all lumber manufacturers. Of late years the insurance companies have done a great deal in the line of encouraging the owners of sawmills to improve the nature of their risks. An educational campaign along this line has resulted in materially reducing the losses by fire and also in cutting down the premium costs of the insurers. A practical form of advice to sawmill owners is a "fire bulletin" issued periodically, which can be hung up on the walls of the mill and which serves to keep the employees and the owner of the mill continually mindful of their duties in the direction of guarding the mill from fire. Reed, Shaw and McNaught of Toronto commenced issuing bulletins of this nature, printed in large black type, last spring. In many of the prominent mills of Ontario these bulletins are now to be seen prominently displayed.

Bulletin No. 7, the last of the series to date, contains the following useful advice:

Hydrants: Have your foreman test your hydrants and hose once a week to see that the valves and pump are in order, and that the hose and nozzles are connected and properly hung.

Casks and pails: Have them inspected weekly. If your pails are being stolen, put in new metal pails with many nail holes knocked in the bottom and smeared with pitch or axle grease.

Dust: Accumulated dust on beams would probably start a conflagration from a short circuited electric wire. Recommend the beams and framing be swept down weekly.

Platforms and tramways: Have them kept cleaned off (preferably by hose). A spark lighting on the dust would start a quick fire.

Private locomotive: If you use such, keep an eye on the outside bonnet spart arrester.

Important Extensions to E. H. Heaps Concern

It is understood that $2,000,000 of English capital have been secured for the extension of the business of Messrs. E. H. Heaps & Company, Limited, lumber manufacturers of Vancouver, B. C. This result, after full investigation of the possibilities of the enterprise, followed Mr. Heaps' recent visit to London. The company has now in operation a sawmill, planing mill and sash and door factory on its waterfront site on Burrard Inlet in the east end of Vancouver. New mills of the same character, but of much greater capacity, will be erected alongside the existing plants. The sawmill will have a total capacity of 30,000,000 feet per annum. Plans of the proposed additions are now being prepared and construction work will be started shortly. The plants will represent the latest ideas in sawmill practice. Arrangements have also been completed for the erection on the same site of modern machine shops for the manufacture of internal combustion engines, motor cars, taxicabs, commercial trucks and motor fire apparatus. The machinery for this portion of the enterprise will be imported from England.

The programme of improvements also includes the erection of a sawmill plant at Ruskin at the mouth of Stave river, near the main line of the C. P. R., to replace the company's sawmill partially destroyed by fire last year. There will also be a new sawmill and a new sash and door factory and planing mill. The plant will have the same capacity as the proposed new plant in Vancouver, giving them a joint annual output of 60,000,000 feet. Construction work will start simultaneously with that in Vancouver and one year hence will see the new enterprise in operation. Meantime, the Vancouver mill will continue to run full blast.

Ruskin is tapped by a spur of the C. P. R. and is only a few miles distant from the power plant of the Western Canada Power Company. The company owns the townsite and purposes exploiting it for industrial purposes, as cheap power for manufacturing purposes is assured. Negotiations for the establishment of three English industries are nearing successful completion.

By the terms of the deal the British investors also acquire an interest in the timber limits of the Messrs. E. H. Heaps & Co., Ltd., situate at various points up the coast as well as within the Dominion railway belt. All holdings are vested in the one corporation.

CAMP DEPARTMENT

Soda Water and Hot Drinks for Lumbermen

Something rather novel in the direction of service supplied by a general store in a lumber manufacturing town was suggested recently at the meeting of the National Commissary Managers Association at St. Louis, Mo., in an address delivered by R. R. Shuman, advertising manager of The Liquid Carbonic Company of Chicago. Mr. Shuman's suggestion was simply that the manager of these stores, "commissaries" as they are called in the United States, should install a plant for the manufacture and sale of soda water beverages, hot chocolate, etc. Although in the southern states there would probably be a better demand for such drinks in the hot summer months, than in Canada, there is much to be said in favor of such a proposition in Canada, as there are many such stores operating in this country at which a good profit could no doubt be made in this manner. Mr. Shuman's remarks were in part as follows:—In conversation with managers of Commissary stores, I often hear a note of complaint—a wail of protest against the "restricted conditions" and "narrowed opportunities" in which many of you think you work.

Why, men you don't know how lucky you are! Your very restrictions are largely to your benefit, because they permit you to farm your territory intensively, with less waste, less loss and less risk than confront the man who is fighting against competition on every side for his little bite of the general "pie" of his community.

You know what your company pays its men—you know how permanent the employment is—you know how the families surrounding your store are free from many of the temptations to spend money elsewhere—and you know that you have an advantage in securing and holding their business that no independent merchant possibly can have.

The Matter of Credits

I do not know what the average credit loss is to the average general merchant, nor do I know what his average collection expenses are, but whatever these expenses are—and they must be considerable—you, because of your relations with the employing company, are largely, if not wholly, absolved and insured against any such trouble.

In many ways the company store is misunderstood, and the company store system as a whole is made to answer for the sins of the few who have been extortionate; but the more I get to know the company store, the more I understand the policy of the men responsible for such stores, the more fully I am convinced, except in the case of a small minority —too small to be considered—that it is the aim and purpose of such stores to give the best possible values for every dollar they charge; and I do not believe that there is a man here who would try to prevent the people of his community from trading elsewhere by resorting to the power of the "big stick of the big boss;" for you know as I know, that the company store manager who follows the policy of giving the people the largest value and thus making them prefer to trade at his store rather than anywhere else, is the true manager, and that permanent success can come from no other policy.

But I have not come here to preach a sermon on merchandising or on company policy; my purpose here is a more practical one than that. I have come in order to show you in dollars and cents language that the charm of your store to your community can be wonderfully enhanced and strengthened and the temptation to trade elsewhere by mail or in person reduced to a marked degree by installing in your store an up-to-date soda fountain, an up-to-date carbonator, and up-to-date outfit for dispensing hot beverages.

Mr. Shuman then dealt in detail with the profits made from the soda water and ice cream fountains in large department stores and continuing said:

Some of you say, "Yes, you are probably right about the soda water business; but we have no room in our store for it."

My reply is, that land is cheap, and lumber is cheap and you have all of the out of doors to spread in. If there is no room in your present store, for the sake of your reputation as a far seeing man, start something in motion that will result in your either enlarging your store or building a new store to give room for this important, useful, economical, financial, and moral addition to your community.

My suggestion is that you have a store with two entrances or a double store, so that of an evening the wives and daughters of your community could find a comfortable and quiet place to sit down and enjoy their soda without being obliged to pass through a crowd of smoking, swearing men; and also on behalf of the men so they would have a place to enjoy a fizzing drink without feeling constraint that follows the presence of the fair sex.

Most of you sell bottled sodas, but most of you have poor, inadequate facilities for keeping them cold, and few of you realize the importance of this branch of soda water selling.

When you install an iceless soad fountain, get a fountain that has a large refrigerator in it, so that you can store quantities of bottled goods in it and keep them ice cold all the time. Keep a great variety of bottled sodas always on hand and give your customers a choice of either a bottled or draft drink. Display bottled sodas prominently about the fountain, put them on your menu, and you will find your soda fountain will not only cut down the sale of the bottled sodas, but will greatly increase it.

In this connection, let me suggest that you safeguard the interest of the bottler by seeing to it that he gets his bottles back. The more money he loses in bottles, the more he will have to charge you for his goods. Now, here's a scheme that will not only insure the return of bottles, but will stimulate your trade. Most of your customers are on the credit basis. Sell them bottled soda water at 10 cents a bottle on credit and give every fellow 5 cents in cash when he returns an empty bottle. When the fellow wants loose change in his pocket, the most natural thing to do would be to buy 50 cents worth of bottled sodas, having it charged to him, and when he returns the five bottles he gets 25 cents cash money to jingle in his jeans.

Show the bottler from whom you buy your goods that he gets his bottles back, and that you pay cash, and you can buy from him on the lowest, most favorable terms on which goods can be made.

And while I am on the subject of bottled goods, I want you to make a study of this profitable line of your merchandise—a study into its quality, purity, cleanliness. Go through the man's shop, making him show you what he uses in the preparation of the goods that you are to sell to your friends, neighbors and customers. And if he can't "make good" under this reasonable scrutiny, quit him and throw your business to some other bottler who will.

Costs and Profits in Soda Water

But my immediate subject is soda fountains, and not bottled sodas. Do you know what the profit is in a glass of soda water?

I'll tell you.

The average 5 cent soda without ice cream costs you 1 cent to 1½ cents. With ice cream, 2½ cents, and you ought to charge 10 cents for an ice cream soda. Fruit sundaes cost from 2 cents to 3 cents, according to materials used in them; and they sell at 10 cents or 15 cents, according to your courage and their goodness.

A complete soda water outfit consists of:

1—A soda fountain, costing from $175 to several thousand.

2—An automatic carbonator costing from $150 to $200 in combination with filter tank and filter.

3—A hot soda urn for winter dispensing of chocolates, bouillons, etc., costing from $25 up.

4—An equipment of silverware, glassware, chinaware, tables, chairs, and small tools, such as the dispenser needs—most of this material, however, you already carry in stock.

5—A percolator for making your own sugar syrup.

6—Supply of fruits, etc., syrups, for cold soda water, and cocoas, beef bouillon and other food products for making hot drinks.

This whole department can be installed in a small way for not to exceed $500, and the food products, that amount will include, will serve beverages for which you will take in from $100 to $200. You should average $10 to $15 gross profit a day from a department of this cost, winter and summer, or at least $100 a month clear above all expenses, labor included.

A one thousand dollar investment will give you a department that should earn at least $20 to $25 a day, or at least $200 a month clear.

For $2000 you should be able to equip a soda water parlor complete with a very handsome fountain, and this price will also include the whole cost of an ice cream factory sufficient to all your needs. If you have a population of 1,500 people, or say 500 adult pay envolopes, to draw on, this latter investment of $2,000 will be fully justified.

Six per cent. on $2,000 is $10 a month. Such a department in such a 500-pay envelope community should bring you in nearly $1,000 a month, of which 50 per cent. is gross profit, and $250 a month isn't bad, is it?

Now is a good time to add this money maker to your store. The soda fountain manufacturers all give spring dating on fountains and carbonators bought now, asking only a nominal payment at time of installation. Then, beyond that, they are willing to give two years' time at 6 per cent. interest. You can therefore inaugurate this new department very largely on the manufacturer's capital, on a basis where neither you nor your company will even feel the cost.

How shall a man know whether a soda water and ice cream business will pay in his locality?

It is all a question of averages, based on number and earning power of the population you serve. There are about 20,000,000 families in the United States. The whole country spends $20,000,000 a year in soda water and ice cream—$10 a family. The average for your community should exceed this because most of you are in "dry" territory, where your soda water is the only drink that can be readily obtained; and you are so far removed from the world's fruit markets that only for a very brief season will the sale of fruit interfere with the sale of either ice cream or soda water.

A "family" in my statistics may be one man unmarried—for the adult wage earner is the basis of a family. Every wage earner, therefore, in your community is good for at least $10 a year; and I am pretty sure that with most of you, your receipts from soda water and ice cream will amount to $25 a year per wage earner, young and old, black and white.

And remember that the money you make depends on the profit per cent. of the volume of your sales rather than on the gross sales. Even if your community is now spending at your store every dollar of its income that you could possibly hope to secure, and that soda water and ice cream will not increase your gross income by a single nickle, it will still increase your profit because every dollar spent for your soda water or your ice cream or your bottled sodas will show you at least 50 cents net profit; while your average net profit on all your other goods is somewhere in the neighborhood, let me say, of 20 per cent.

Thirsts Will Be Satisfied

Thirst is the most insistent of all appetites. People will satisfy thirst if they must go hungry to do it. Your soda water department properly housed, in cheery, inviting surroundings, will become the neighborhood club, not a few, but for the whole population. Its influence, physical, social, moral, and financial, is all good. The people must be amused. If you give them this harmless, this wholesome, this inexpensive form of amusement, they will have better health, more contentment, and more money than if they were forced to seek amusement in other directions, outside of your own little community. And yours will be both the honor and the profit.

Fewer Forest Fires in British Columbia

Mr. Wynward C. Gladwin, Supervisor of Fire Wardens for B. C., reports the number of forest fires for the season have been not more than half of last lear's. The decrease is attributed to the close patrol, to the frequent rains, and to the greater precautions on the part of railways, lumbermen and settlers. To judge from the reports already in, the loss this year is fully 70 per cent. less than it was last year. During the active part of the season the fire patrol have a busy time watching the settlers, and directing them in the clearing and burning operations. The danger period is now over for the year and the men are at present chiefly employed going over the rights-of-way of all the provincial railway lines. They do this to see and make a report in connection with debris on in the close vicinity of the rights-of-way. Many bad fires in the past have been caused by debris taking fire from the locomotives. Attention given to this phase of the work in the autumn greatly lessens the probability of fires from this cause during the ensuing year.

Timber Land Taxation in B. C.

Taxation on timber limits as at present levied by the provincial government was objected to by large operators at the sitting of the Royal Commission on Taxation which held a meeting in Vancouver recently. This commission was appointed by the provincial government to go into the whole question of taxation in the province. Timber is assessed at 2 per cent. of half of the value of the stumpage. E. J. Palmer, manager of the Victoria Lumber & Manufacturing Company, under which name the Weyerhaeuser-Humbird interests operate at Chemainus, Vancouver Island, contended that the tax should be three-fourths of 1 per cent. of the full value of the stumpage. Under present conditions, he said, there was no appeal against the rate set by law. Under the proposed arrangement, if taxation should seem unreasonable, it would be possible to appeal against the full valuation. He showed that the stumpage tax over a period of ten years at 2 per cent. upon $15 an acre, half the valuation, amounted to $2.92 an acre, and this assessment, together with an estimated loss of one-half of 1 per cent. annually from fire, made it essential to the lumbermen to get their timber to market as soon as possible, allowing no opportunity for conservation.

It was argued also by Mr. Palmer that fire protection should be provided by assessment on limits in proportion to the value of standing timber. In addition, valuable by-products of the big timbering interests were left untouched in British Columbia. The government measure prohibiting the export of telegraph poles, when a ready market could be found in California and South America, made that phase of the business unprofitable.

Another protestant was A. D. McRae, of the Canadian Western Lumber Company. He declared that there was no reason for discrimination against the lumber interests, and suggested that the tax should be one-half of 1 per cent. He pointed out that lumber was doubly taxed, as an additional assessment of $2 a thousand feet of merchantable timber was imposed to insure that the logs would be manufactured into the finished material in this province.

Treating the Forest as a Crop

The progress of the Conservation policy of Canada, as applied to forest resources, depends more upon the Forestry Branch of the Department of the Interior than upon any other organization. Upon the technical knowledge and executive ability of the officers of the Forestry Branch depends the future of the forest on 16,000,000 acres of Dominion forest reserves, as well as upon the large area of non-agricultural forest land in Western Canada, which for the good of the country may yet be set aside as permanent forest reserves. In addition to looking after Dominion lands the Forestry Branch is now being asked by eastern land owners to furnish advice as to the best means of securing at the earliest date a profitable crop of timber on waste land or wood-lots. The proper administration of forest lands requires a special knowledge of the trees best adapted to each region, of their uses, and of the markets. Further there is needed knowledge of the habits of all trees, especially of the mercantile species, so that it may be known how rapidly they grow, how they produce their seed, when and under what conditions the seed germinates, and in what way the seedlings and young trees are affected by their surroundings. Such knowledge is gained only by long study and experience. In order that the new Rocky Mountain Forest Reserves may be administered according to the latest scientific knowledge and the best experience, the Forestry branch is now making detailed studies of the habits of the merchantable species of trees on the eastern slope of the Rockies in Alberta and has sent one of the men in charge of the work to study the systems of forest management practiced during the past few years by the highly developed United States Forest Service in the National Forests of Montana. The United States foresters have spent large sums of money and availed themselves of the experience of many men in developing plans of lumbering which do not inconvenience the lumbermen but which ensure the protection and reproduction of the forests. The Canadian Forestry Branch intends to benefit largely by their experience.

Hardwood Resources of Canada Diminishing

Canada is dependent for its lumber supply on the soft woods of the forest much more than is the United States, as seen from the 1910 Forest Products report compiled by the Dominion Forestry Branch and shortly to be published. Of the 1910 Canadian lumber cut amounting to nearly five billion feet, only one-twentieth consisted of hardwoods or broad-leafed trees, worth barely five million dollars; on the other hand almost one-quarter of the lumber cut in the United States consists of hardwoods, which country had far greater hardwood forests than ever Canada had. Canada is already feeling a shortage of the hardwood supply and makes up the national deficiency by importing annually from the United States, hardwood lumber to the value of seven and a half million dollars. Thus the value of the hardwoods imported into Canada during 1910 exceeded by 50 per cent. the value of the hardwoods manufactured into lumber. Nearly all of these imports are from the United States and consist of the most valuable species such as oak, hickory, tulip or yellow poplar, chestnut, gum, walnut, cherry and a large amount of hard pine which is so frequently used as a hardwood. From these above figures it is seen that we are becoming more and more dependent upon the United States whose available supply for export is surely and rapidly decreasing. Whatever can be done to improve the resources of Canada by the elimination of wood waste, and particularly by the development of the small wood lots of Ontario, Southern Quebec and the Maritime provinces, should be done with all possible speed.

The report of the Canadian Forestry Convention held at the city of Quebec, January 18th to 20th, which was convoked by Sir Wilfrid Laurier and which took the place of the Twelfth Annual Convention of the Canadian Forestry Association, has been issued in book form by the Canadian Forestry Association. Copies may be secured from the secretary of the Association, Ottawa.

This Plant of the

Canadian Linderman Co., Limited

at Woodstock, Ont.

stands as a guarantee to the Canadian manufacturers of the economic efficiency of **glue jointing** by the Linderman method. The land, buildings, fixtures, tools and materials represent an investment of over $160,000 all devoted exclusively to the manufacture of the

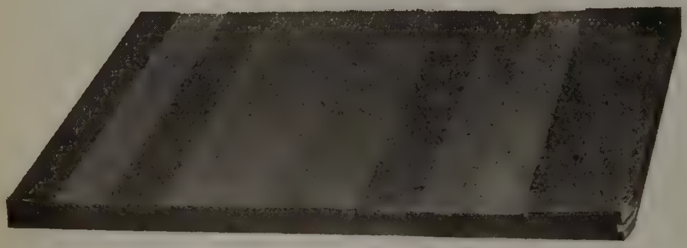
LINDERMAN
Automatic Dovetail
Glue Jointer

CANADIAN LINDERMAN COMPANY LTD.

Lindermanized Glue Joints

means economy in labor, lumber and glue, producing a stronger, better and more permanent joint than any other. In **dollars and cents** it means a saving of 60 per cent to 80 per cent over your present method.

The Method



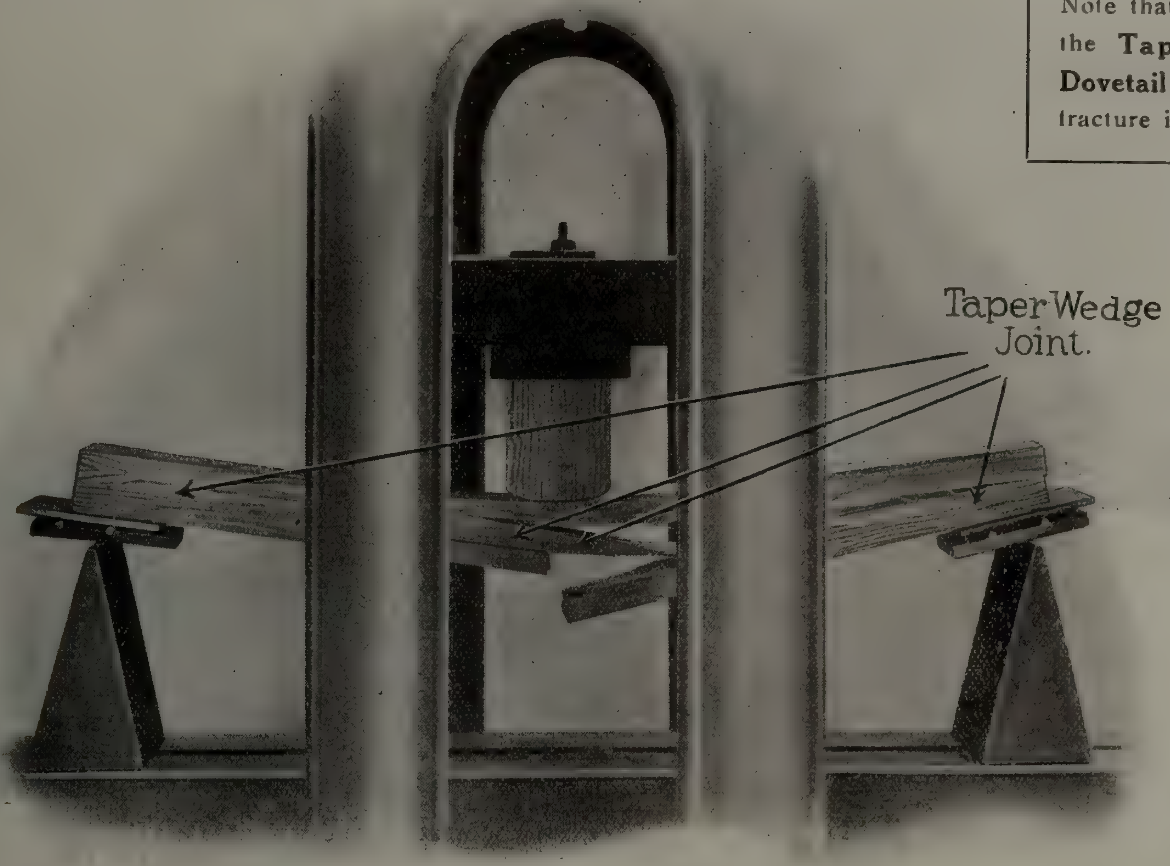
Two boards of equal length, of random widths, are fed into opposite ends of the machine. In one operation the dovetail is cut, the glue is spread and the pieces forced together, making a completed joint. This piece is passed back through the machine and another board is joined to it. This operation is kept up until a panel several inches wider than the desired width is obtained; then the operator rips it to size and the edging is passed through the Linderman machine and is joined to another piece.

Canadian Linderman

THIS TECHNICAL TEST

showing 2,700 pounds breaking load

Note that the Strength of the **Tapering Wedge Dovetail Glue Joint** forces fracture in the solid wood.



made at the Purdue University, Lafayette, Ind., on the Tapering Wedge Dovetail Glue Joint proved that this joint was stronger than the natural wood, and this new way of dovetailing lumber together on a **Linderman Automatic Dovetail Glue Jointer** gives the manufacturer an opportunity of producing from narrow lumber panels that are better than wide lumber.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Francis Hydraulic Veneer Press Equipment

A number of progressive Canadian Manufacturers are already using what is known as the Francis Hydraulic Veneer Press Equipment and it is certain that many others will, in the near future, find it to their advantage to install this equipment. In the United States it is in extensive use and is giving universal satisfaction. Among its important advantages, as claimed by the manufacturers, are its unlimited capacity, the satisfactory work produced, the large saving effected in time and labor, and the long life of the equipment.

Rolling Stock into Press

All who are interested in veneering and built up work will be consulting their own interests in investigating this equipment. It is claimed that it will pay for itself inside a few months.

One furniture manufacturer reports that by its use he is saving the services of six or seven men as compared with the presses he was formerly using. The accompanying illustrations are of a 42 x 108-in. Heavy Duty Hydraulic Veneer Press Equipment with new loading and unloading device, in use in the plant of the Conway Veneered Door and Mantel Co., Milwaukee, Wis. The following is a copy of a letter from this company regarding the equipment:—

"We have your letter of May 18th, inquiring how we like the Hydraulic Press Veneering Equipment, recently installed for us. We would say that we are very much pleased with the whole arrangement, which includes the hydraulic press, retaining clamps, roller truck and trestles, unloading device, together with two glue spreaders. We have the two glue spreaders set so that the man who takes away from the spreaders can load directly onto the roller truck from which it is pushed into the press onto the trestles, and after being pressed and the retainers put on it is pushed onto an ordinary factory truck from the same trestles. The arrangement works perfectly, allowing us to load and unload without the slightest hitch, and we could, if necessary, work another glue spreader with the same press, largely increasing our output. We are not only pleased with the whole arrangement, but we think it does more than you claim for it, as we could if necessary veneer a considerable amount of work more than we are arranged to take care of. We examined several arrangements of hydraulic presses before closing the contract with you, and we are satisfied with the selection we finally made, particularly as to ease with which the stuff can be handled with the press, both loading and unloading."

Pressure Applied, Retainers Tightened

Full information about this equipment may be secured from the manufacturers, Chas. E. Francis Co., Rushville, Indiana, U.S.A., who for many years have been making a specialty of glue room equipment.

Wire Goods of Interest to Lumbermen

The Canadian Wire & Iron Goods Company, Hamilton, Ont., have favored the Canada Lumberman with a copy of their new catalogue No. 3. The catalogue is attractively published on a fine quality of paper and the letter press and illustrations will appeal strongly to those who appreciate an attractive book of this nature. This company manufactures wire cloth and perforated sheet metal, ornamental and wire work, especially iron, brass wire work and wire goods of other descriptions, also elevator enclosures, wickets, window guards, brass tube rails, grilles, gates, clothes locks, jail cells, etc. Their office and factory are located at 182-186 King William street, Hamilton, Ont. One of the products of this company's factory which will be of interest to lumbermen is their excellent spark arrestor. This is made in two styles, one with a hinged lid and lever and the other with a stationary lid. On the former the operation of the lever acts as a hammer and a few pulls on the wire rope clear the meshes of soot. It is adjusted by means of clamps. Those who are interested in products of the above nature will consult their own interests by communicating with the above firm.

The Smart-Turner Machine Company, Limited, Hamilton, are supplying the Intercolonial Railway at Sydney, N.S., with a duplex pot valve pump. The Smart-Turner Company have also received an order for a duplex plunger pump with pot valves from The International Harvester Company, of Hamilton, Ont.

The Design of the Raker Tooth

An interesting and valuable explanation of the importance of the raker or cleaner tooth of the cross-cut saw has been issued by Henry Disston & Sons, Incorporated, Philadelphia, one of whose important branch factories is located at Toronto. The article is in the form of a four page folder with a large illustration on the front page showing how the raker tooth does its work. Other illustrations also help to explain the points made. The article has the merits of brevity and clearness and will convince everyone of the importance of proper methods in the design of these teeth.

Referring to the question regarding the proper length of the raker tooth the article says:—"The importance of this can be gathered when we tell you that some rakers are left but 1/100 of an inch shorter than the cutting-teeth and from that anywhere to 1/32 of an inch, a gauge being used to insure uniformity. The length, however, is determined by the kind and class of timber to be cut; for the very hardest and driest woods the rakers should be 1/100 of an inch shorter than the cutting-teeth, while for hard, green woods the rakers should be 1/64 of an inch shorter and, graduated from that to 1/32 of an inch according to conditions and timber when cutting softer woods.

"The rakers absolutely should be shorter than the cutting-teeth, for if they are too long they will not allow the cutting-teeth to come in proper contact with the work and the saw will not cut freely. Even if a slight fraction too long they will prevent the saw from doing good work and the sawdust or thick shavings will have what the woodsmen term "whiskers," which prove the rakers are too long, for they go below the scoring of the cutters, breaking the wood and tearing it out.

"Rakers in this condition make the sawing difficult and the saw so hard to pull through the cut that a sawyer could not keep it up long, whilst on the other hand, where a long raker is required, if it just cleans out the cut, leaving a faint mark of the scoring teeth, it is then the proper length and the saw will cut faster, with the least exertion.

It is well to understand that extra weight is of no benefit in a cross-cut saw. The chief points are the cutting-teeth, the rakers and the grinding or taper, not considering the quality of the steel which, of course, is the foundation upon which rests all subsequent work. But irrespective of all other points and referring again to the rakers, **they are the controlling power of saw cutting,** for if too long they cause the saw to ride or jump and prevent the cutters from scoring, while if properly fitted they steady the blade and draw it into the wood, bringing the cutting-teeth into more active work."

P. Payette & Company's Excellent Plant

One of the oldest and best known industries of the Georgian Bay is that of P. Payette & Co., established some thirty-two years ago by Mr. P. Payette as the Penetanguishene Foundry & Machine Shop, whose different lines of saw-mill machinery have become popular with the lumber trade from coast to coast.

From the first Mr. Payette has had active oversight of the concern and the several very important inventions in the line of saw-mill machinery under which the company manufacture are his own design. Mr. Payette is one of Penetanguishene's representative and influential citizens. In the town he has held a number of official positions and is at present a member of the Board of School Trustees.

Among the many lines of machinery manufactured by this firm, especial mention may be made of their New Heavy No. 2B Three-Head-Block Carriage, which when equipped with the "P. Payette Patent Mill-Dog" and their Duplex Frictional Grip Set-Works which will set to one-thousandth part of an inch, makes a carriage that is up-to-date in every respect and which is fast finding favor with the saw mill trade.

Of the P. Payette Patent Mill Dog very little need be said, as it is used so successfully and extensively by many large firms from east to west. A recent test cut with their Lath Mill & Bolter showed 128,350 four-foot laths, 1½ in. by ⅜ in., counted, tied and piled in ten hours.

P. Payette & Co.'s Plant, Penetanguishene, Ont.

Other lines of machinery turned out are steam-feeds, steam lifters and loaders, steam canters, light and heavy duty edgers, combined gang circulars and edgers or independent gang circulars, and a general line of saw-mill machinery, detachable sprockets and castings of either Gray iron or semi-steel and brass castings for general use.

The plant is modern in every respect. The floor space of the office and show-room is 30 x 66 feet, the second storey of which comprises the pattern shop. The machine shop is 30 x 100 feet. The foundry is 33 x 40 feet and the cupola room is 18 x 14 feet. The pattern store room is 20 x 40 feet. All these buildings are of brick, steam heated and electrically lighted and are complete with up-to-date machines and tools. The warehouse is 25 x 100 feet with a cement floor all through. Splendid shipping facilities both by rail and water are enjoyed by the company.

Beal Bros., Limited—Specialists in Harness

Every lumber manufacturer in Canada is interested in harness and it is natural therefore, that many of them visited the exhibit of Messrs. Beal Bros., Limited, at the recent Canadian National Exhibition, in Toronto. This was the first time the firm had exhibited their harness and the results were exceptionally gratifying. The illustration accompanying this article gives a good idea of the splendid manner in which the exhibit was presented and accounts largely for the success with which it was attended.

Messrs. Beal Bros., Limited, have been in business some thirty years and have continually extended their trade during that time. They have recently placed upon the market a new line which is known as the "Empire Brand." The exhibit at the Canadian National Exhibition included at one end of a splendid assortment of horse collars embodying every line in use from Atlantic to Pacific.

BEAL BROS
LEATHER &
BEAL BRO

Unique Exhibit of Beal Bros., Limited

At the other end was displayed a half dozen sides of Round Knife Brand harness leather. In a glass case were arranged a splendid line of housings and fronts (all manufactured by Messrs. Beal Bros., Limited), and an excellent line of sporting boots and moccasins.

As a result of the success of the exhibit and the widespread attention which it attracted, Messrs. Beal Bros., Limited, will be represented again next year at the Canadian National Exhibition and are already making plans to greatly surpass the splendid showing that they made this year.

Manufacturing Shoepacks in Meaford

For over 30 years the name of A.C. Todd, of Meaford, has been prominently connected with the shoe and harness trade of Canada through the manufacture of his well-known line of oil-tanned leather. Mr. Todd is a pioneer producer of oil-tanned leather, having introduced this system about 20 years ago. Since then he has specialized in oil-tanned stock which has become very popular. His aim has been to turn out a grade of leather second to none and that this has been attained is attested by the approval of the trade at large. Only the purest ingredients enter into the manufacture of his stock. Hence the leather is always in a pure preservative state, and it is claimed by the maker that it is the only leather manufactured in Canada that will not spue out, and that will absolutely resist water.

Realizing that this leather was specially suitable for the manufacture of shoepacks, Mr. Todd decided last year to use the whole product of his tannery in the manufacture of these lines and erected a large factory which he has had fitted with the most up-to-date machinery, employing expert workmen, so that he bids fair in a short while to make his shoepacks as popular as his leather has been in the past. The packs are all made of oil-tanned leather, both in foot and leg, no splits being used, and are all hand sewed. Back

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

Ten cars 2-in. Log Run Maple. State best price for cash. Box 330, Canada Lumberman, Toronto, Ont. 18-23

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Spruce Wanted

We can use short spruce 4-4 and 5-4. Describe what you have to offer and lowest price delivered here. The Rathbun Company, Deseronto, Ont. 21-24

Wanted

250 to 350 M. feet B.M. of spruce timber required, in the round, to be cut the coming winter, and delivered next spring. For particulars apply to J. Sheppard & Son, Box 309, Sorel, Que. 20-23

Wanted

Cash paid for green clear maple axles, 4¼ in. x 5½ in., 6, 12 or 18 ft. long. If you can get out a car load or more, write us. Warren Ross Lumber Company, Jamestown, N. Y. 42-42

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Lumber Wanted

We are open to buy a few cars of good common and better dry Soft Elm, Birch and Hard Maple, in 1½ and 2 in. thicknesses. Also give us a list of any other dry Hardwood Lumber you have. Address, The London Lumber Co., London, Ont. 18-21

White Pine

WANTED—White Pine trimmer ends in any quantity and any thickness. Write, stating what quantity you have, what you want for them per cord f.o.b. cars your station, and any other particulars such as how piled, if bright, etc. Address, The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 20-23

FOR SALE—LUMBER, ETC.

Maple and Beech

For Sale—One and two common and cull maple and beech cull. Also about 70,000 feet of S. G. Pine. Apply to B. G. Sawyer, Fennells, P.O., Ont. 21-21

Beech for Sale

For sale, two carloads Beech lumber, bone-dry, one and one-half inches, running high percentage clear stuff. B. Bell & Son Company, St. George, Ont. 21-24

For Sale

Our season's cut of White and Red Pine. We are desirous of disposing of same quickly and invite your inspection of the lumber which is mostly from large run of White Pine Logs. Pine Lumber Company, Pine, Ont., near Chapleau. 19-22

Hemlock and Hardwood

Hemlock, Birch, Maple, Elm, Beech, on C. P. R. near Bala. Private switch. Sawing just commenced. About 750,000 M. Box 345, Canada Lumberman, Toronto, Ont. 20-21

Camp Equipment

For sale—Equipment for lumber camp, including 25 sets sleighs with bunks, beams, etc., 2 sets tank sleighs, 1 Wilkinson Snow Plow, cooking ranges, stoves, etc., etc., making complete outfit for one small camp. Detailed list on application to the DeLaplante Lumber Company, 512 Continental Life Bldg., Toronto. 21-21

We Want a "Want Ad" From YOU

¶ Just an opportunity to prove to you what a quick purchase or sale you can make by advertising in this department.

¶ The page is before you—read what the other fellow wants, or has for sale.

Canada Lumberman and Woodworker

Toronto - Canada

WANTED—MACHINERY, ETC.

Do It Now

Another day gone, and probably the reason you have not sold that second hand equipment of yours is that you have not advertised it in the Canada Lumberman & Woodworker. 19-22

FOR SALE—MACHINERY, ETC.

Operating Saw Mill For Sale

at Uhthoff Station, G. T. R. Capacity 25 M. feet, containing stationary boiler, 80 h p.; one engine, 50 h.p., and machinery outfit and building. Will accept $1,000 in full to close estate, as timber is done. Apply to W. B. Tisdale, Orillia, Ont. 17-t.f.

Machinery For Sale

Carver, 4 spindle, Rohlman.
Cut-off saw, railway, wood frame.
Dovetailer, Boults.
Engines and Boilers, various sizes.
Floorer, 9-inch Berlin.
Jointer, chair seat, Jenkins.
Jointer, 16-inch White.
Moulder, 6-inch Houston.
Mortiser, Smith.
Mortiser, Bit.
Planers, 24-in., single belted.
Sander, double 24-inch Perry.
Sander, three drum, Columbia, 42-inch.
Sander, three drum, Boardman, 42-inch.
Saw Gummer, Rogers.
Saw-mill, band, 63-inch wheel.
Saw and dado machine, Williamsport.
Variety lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

Boilers For Sale

For sale, six 54 in. Tubular Boilers, 14 feet long, in good condition. Tested to 100 lbs. steam pressure, complete with all regular fittings and sawdust grates. Can be seen at Calumet, Que., or apply Riordon Paper Company, Limited, Montreal. 21-24

Extraordinary Proposition Log Cars

Russell 50,000 lb. capacity standard guage, automatic couplers, airbrakes, 26 in. wheels, strictly first class condition in every respect. Phenomenal bargain, immediate shipment. Write or wire.

DULUTH IRON & METAL CO.,
20-23 Duluth, Minn.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. e cents extra. Minimum charge 25 cents

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Situation wanted by a very practical and capable northern hardwood lumberman, 12 years experience in every detail of the industry from stump to market. Am first class mill manager, inspector, buyer and salesman. Broad acquaintance with both manufactures and consumers throughout New York, New England, Quebec and Eastern Ontario. Best of reference. Open Oct. 15th. Address, P.O. Box 133, Carthage, N.Y. 20-21

Young man, 25, with ten years' experience in the lumber trade of Germany, Austria, Bosnia, Egypt and Argentina, having connections with the importers of these countries, speaking English, French and German, first class bookkeeper, very quick and accurate at figures, forest estimator and also possessing technical knowledge of sawmill plants, etc., desires position. Very best of references furnished. Address: Fritz Martius, care L. Betz., 789 Elton Ave., Bronx, New York, N.Y. 21-21

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Immediately, two competent lumber inspectors with thorough knowledge of Ontario grades. Steady position to right man, Apply Thessalon Lumber Company, Nesterville, Ont. 21-21

Wanted—Sash and door factory man with some capital to take interest in factory and lumber yard. Excellent opportunity for man capable of taking charge and estimating. H. J. H. Mathison, Sault Ste. Marie, Mich. 20-21

BUSINESS OPPORTUNITIES

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Circular Mill For Sale

For sale, practically new circular mill on Georgian Bay. Splendid shipping facilities. Suitable for cutting either pine or hardwood, and good market for all mill can cut for next five years. Apply Box 239, Canada Lumberman, Toronto, Ont. 20-23

Business Opportunity

WANTED—A man with $15,000 to $20,000 to buy and run a mill business in the Province of Quebec, with sufficient capital to buy every year 40,000 to 50,000 logs. Lumber may be exported by vessels to England or United States, or by rail to the United States. A wharf 400 feet long will be built in the locality by the government and could be contracted. Tenders asked. For particulars, apply to Box 346, Canada Lumberman, Toronto, Ont. 21-21

Sawing Contract Wanted

Double Band Mill on Georgian Bay, open to contract for early spring sawing; lowest insurance and highest quality work.

Box 337 Canada Lumberman,
19-22 Toronto, Ont.

WANTED—A number of responsible mill men to contract for birch and maple for 1912 delivery. Either water or rail shipment. Apply Box 240, Canada Lumberman, Toronto, Ont. 20-23

WANTED

Will finance a good mill to buy hardwood logs and manufacture into lumber coming season. Must have basis for at least half million, will contract up to two millions. State all particulars. Box 336 Canada Lumberman, Toronto, Ont. 19-22

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address, Box 332 Canada Lumberman, Toronto, Ont. 19-22

Wanted

A stock of logs to cut for the season of 1912, or a partner having from $10,000 to $15,000 to take an interest in a well equipped circular sawmill at Wiarton, for making lumber, lath, shingles and boxes, with lots of power to run all at once, or will sell the mill at a reasonable price. Railway and boat connection. Box 177, Wiarton, Ont.

For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.
11 M. ft. 1¼ in. good basswood short, 2 to 5 feet.
14 M. ft. 2 in. good basswood short, 2 to 5 feet.
50 M. ft. 1 in. M. C. Ash.
50 M. ft. 2 in. M. C. Ash.

GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale

Shingle, Lath and Planing Mill, and Pulp Wood, Rosser, on siding of T. & N. O., and on lake convenient to timber. Several good lots, also Boiler and Engine and other machinery suitable for mill with capacity of 25,000 feet per day. Waggons, Sleighs, Blacksmith out-fit, Store, Dwellings, Stables, suitable for carrying on operations. For further particulars apply P. O. Box 109, North Bay. 21-22

FOR SALE

Saw mill, capacity fifteen M. ft. per day. Two thousand acres timber, consisting of hemlock and hardwood. Mill limits located on Mary Lake, Ont. Timber scowed to Huntsville, G.T.R. Considerable timber to be bought. Reason for selling, the executors are winding up estate of the late W. Parker. For further particulars apply to F. H. & E. F. Parker, Parkersville, Ont. 20-23

Mill and Timber For Sale

1,100 acres, well timbered with birch, hemlock, pine, basswood, spruce and cedar, together with new lumber and shingle mill, steam feed, large frame boarding house close to mill, situated on railway siding. Must be sold to close a partnership. Excellent opportunity for small mill man whose supply of timber is cut out and is looking for a new location. Get busy, this is a snap for some one. For further information apply to Box 531, Orillia, Ont. 18-21

MISCELLANEOUS

WANTED—Block of first-class timber land (soft wood preferred) that can be operated at a reasonable cost, price not over $15,000. Principals only need reply; give fullest details in first instance; enclose map if possible. Box 326, Canada Lumberman. 18-21

For Sale

300 acres first class hardwood timber, easily logged, 2½ miles from Emsdale Station G. T. R. Good roads. For further information address Box 22, Emsdale, Ont. 20-20

The British Version of Drying

It is a fact that neither doors nor windows will close properly after a building has been put up for a few months, and it is due to the timber, when worked up for this purpose, having been insufficiently or otherwise improperly dried or seasoned.

Although it does not seem to be a matter of cost to the manufacturers of these articles, as so-called yard drying—that is, by the action of the atmosphere—is far more expensive than artificial drying, owing to the enormous space required, which necessitates capital being locked up during storage, and the enormous insurance rates required by the fire offices.

On the continent and in America, it has been recognized for a long time that the installment of a suitable artificial drying apparatus is by far the cheapest and the best method of avoiding complaints from customers, and to save money, but in this country it seems that artificial drying has not made the progress it deserves, or should reasonably be expected; still, the causes are not quite so obscurely hidden as may be imagined.

About two decades or so back some trans-Atlantic firms, who since have retired from business in this country, furnished instances of these plants, which had been well adapted to the conditions of their own country, but did not suit the altered circumstances under which we have to labor, which is partly due to the variations of the humidity of the air, and partly to the fan construction being then in its infancy, and the functions of fans then being but partially understood. Positive gales were created in the drier, where a very gentle ventilation rather than actual draught, is the ideal state of air movement.

Then the draught tunnel drier system only was experimented with; but although this answered in some respects, especially where common whitewood was required, it did not appeal to the public, owing to the high fuel consumption and their inability to deal with the choicer timbers.

Of late years, however, a very great improvement has taken place in the construction of drying plants, and it is now an accomplished fact that where the very best results are required an artificial drying plant is provided in preference to natural drying.

Working Automatic Sharpeners

The first time use of an automatic sharpener by a man unfamiliar with its operation or special adjustments demands no more care than the most highly skilled man must bestow on the process. The grinding wheel employed must be of suitable thickness and shape on edge. The saw must be adjusted on crosshead to suit its diameter and the hook of the teeth. The belt should be pulled by hand to see that the wheel movement corresponds properly to the gullet outline, and if the saw has previously been filed or ground by hand, producing teeth of uneven length or otherwise lacking in uniformity, the wheel should be allowed to contract at first only with the high spots on the saw, and if the teeth are unevenly spaced, the feed pawl should be adjusted to feed the tooth ahead of the one being sharpened, as a means to equalize the spacings, and ultimately produce a perfect uniformity of the teeth. Lack of familiarity with the operation of one of these sharpeners is not a serious handicap. Perhaps the majority of saw filers are unfamiliar with the automatic circular sharpeners; but reports of trouble are infrequent, and easily overcome. In operating any new machine, the adage, "The more haste, the less speed," applies with force.

Sawing Timber in Cold Climates

Both saws and timber are largely affected by frost, and certain precautions are necessary in cold climates to secure effective working. As regards circular saws, when subjected to severe frost, they become "slack" or weak in the center, and appear more or less "tight" or rim bound at the periphery. This arises from the rim being larger—and having more metal—than the center of the saw, its contraction is greater, and the tension of the saw is thus considerably altered.

Before commencing to saw frozen timber the frost should be taken out of the saw by means of hot water or friction. Select a stout, well-supported tooth adapted to the wood and run it with as little set as may be.

Give the saw a little more lead than is usual in sawing softwood, as it is more apt to run out with frozen timber, and heat the body of the saw, which may become slack.

Review of Current Trade Conditions

Ontario

The lumber trade is reported active at practically all Ontario consuming points, so far as the demand for stock is concerned. This applies to practically all lines. Wood consuming industries of all kinds are looking for stock and the building trade is still active. There seems however to be some fly in the ointment at all times, and now when the demand is good manufacturers and wholesalers are finding the outmost difficulty in securing cars and men. The same report comes from all parts of the country and it seems that the scarcity of cars for shipment and of men to load what cars can be secured is greater than it has ever been before.

In most of the Ontario towns retailers are busy and many of them report a better business than they have had at any other time during the present year. Trade on the whole is very satisfactory and promises to continue so for some time. Everything however, is dependent largely upon the weather. The pleasant weather which has prevailed so far this fall has been an important factor in the improvement of trade, as it has enabled farmers and others to continue making additions and putting up new buildings.

Across the international border on the other hand, the same dull trade continues which has been in progress for many months. The wholesaler and the retailer in that country seems to have no confidence in the immediate future and the result is that when a man needs lumber to fill an order he buys it, but never anticipates.

Operators on the North Shore report an off season and expect a falling off in the output this winter. An interesting development has been the shipment of a large amount of board timber for export to England. The scarcity of men for the woods is growing more pronounced. Wages are from $28 to $35 per month and even at that the men are scarce. Stocks of white pine at North Shore yards are large and sales are slow.

Eastern Canada

The improvement which was reported in the montreal trade in our last issue still continues and has taken on a permanent appearance. It is generally believed to be the result of a widespread improvement in all classes of business. The activity in the Montreal building trade is of course one of the important factors so far as the lumber business is concerned. So strong has been the demand of late that wholesalers report they are unable, in cases, to accept orders as they cannot secure sufficient stock to fill them. This is caused to some extent by the shortage of cars and boats. Reports from some of the Quebec mills are to the effect that there may be a reduction in the cut of lumber on account of the low water which is prevailing. Montreal planing mills are working to their full capacity and cannot fill all the orders they are receiving. There is a good demand for hardwoods, especially oak and chestnut. The demand for quartered oak is a little slower and a slight decline in the price of birch is reported. Hemlock is very dull. Cedar shingles are in good demand. Lath continue firm with a decreased output.

The demand for spruce continues strong and prices at New York are reported to have advanced a dollar or two for some lines. The cooperage trade at Montreal is also enjoying a good business. The export trade with England is excellent but is hampered by the shortage of cars and by the congestion in the Old Country which followed the strikes. A strong market exists for ground wood pulp.

The Nova Scotia deal market is active but the scarcity of chartered tonnage for England is hampering exports. The export trade with the United States continues dull. Local trade is steady.

Prices for eastern spruce, at Boston are unchanged but the demand continues fairly steady. Dealers are selling frames, at $23.50, and plenty of lumber is being offered. There seems to be no likelihood of any advance in prices. There is a moderate sale of random. The demand for spruce boards is small. Shingles and lath are improving at Boston, Both as to price and demand. The best cedar extras are bringing $3.50 in some cases and $3.20 is being asked in most cases for clears. Extras can be had however at $3.40. Lath are firmer and in better demand. Prices for 1⅝-inch range from $4.00 to $4.15 and for 1½-inch from $3.45 to $3.50.

Trade in eastern spruce at New York, is rather quiet, but stocks are low. Prices are holding rather firmly by the mills, but wholesalers are fighting for the trade and the buyer is getting the benefit.

Great Britain

A welcome change for the better is reported in the work of unloading the lumber laden vessels at Liverpool and trade commences to take on a much more normal appearance than it has had for some time past. There is a satisfactory consumption in progress of Quebec pine deals and New Brunswick and Nova Scotia spruce deals at most of the English ports. In spite of the improvement in the unloading conditions at the ports there is still a congestion along the railway lines to the inland points and it will be sometime before this has been relieved. There is a better demand at London for Canadian spruce and pine deals. This is accompanied by light stocks and firm prices, so that prices are expected to stiffen. High freight rates are interfering somewhat with the export business. At public sales there has been active buying.

There is an increased output from the Liverpool yards. Stocks of New Brunswick spruce and pine deals and of yellow pine deals are light. Oregon pine deals are also moving well and stocks are builders are using a large amount of oak logs and there is also a good market for birch logs.

A better demand is noted for spruce at Manchester and stocks are light. There is also a good demand for Quebec board pine. The demand from the shipbuilding and coal mining industries in the North East is active and is strongly reflected in the lumber industry.

Stocks of pine at Glasgow are light as a result of a better demand. There is also a better demand for spruce deals. Wagon builders are using a large amount of oak logs and there is also a good movement of elm logs.

At Foy Morgan & Company's recent London Auction sale 3 x 11 4th Montreal pine sold for £11 for 13 feet. and £10 15s. for the longer lengths. 3-16 x 1 in. brought 9¾d. and 9½d., and ¼ in. sold at 9½d. and 9¼d. The Timber Trades Journal speaking of the London situation says:—"There is leeway to make up, owing to the strike period, and this is gradually being made good. Matters at the docks show much improvement, and the accumulation of goods for piling is now being rapidly dealt with, and in another week will have disappeared if the weather holds fine.

"All branches of consumption are showing well without any sign of rush, and this is as much as can be expected at present. The great difficulty of attracting capital into building properties continues as acute as ever, and the cases of mortgages being called in continue to be numerous. Until there is a notable alteration in this direction we can hardly hope for much improvement in the building demand, but a hopeful feature is that more of the older empty property in the nearer suburbs is being let than has been the case for some months past."

United States

The most frequent report heard nowadays of the lumber trade in the United States is that only the necessary movement of stocks to meet the fall demand is going on. During the season, stocks have been kept low and the indications are that these conditions will continue at least until the end of the present year. Without any expectation of advance in prices between now and next spring, it is not likely that dealers will be in a hurry to increase their stocks. With the approaching period for the taking of inventories, the tendency will naturally be in the opposite direction.

Chicago:—Excellent weather has recently prevailed, at Chicago and building operations continue quite active. The demand for the upper grades of northern pine has slackened somewhat, but prices are unchanged. Low grade stock is moving well and a noticeable improvement is reported. Better prices are being secured for No. 4 and 5. The receipts of the better grades have been rather light. There is a good demand for pattern lumber with steady prices. The demand for hardwood is active, but rather spotty. Buyers are taking stock more for their immediate requirements than for any future trade. Prices as a rule are steady. The furniture manufacturers are a little more active in their buying, but it all seems to be for immediate use. The demand from the piano manufacturers is almost dead. The leading hardwood is plain red oak, for which there is a good demand. All grades of basswood are rather quiet. Birch and maple are selling well. No change is to be noted in the hemlock market, except that perhaps business is somewhate more quiet and orderly. The retail demand for hemlock is fair. Prices still vary greatly as a result of manufacturers having little regard to current conditions. The southern pine situation continues uncertain. Orders have not been very heavy, as buyers are looking for a considerable reduction, consequent upon business depression. Manufacturers however, are of the opinion that the conditions of stocks will enable them to maintain present prices. The yellow pine situation is being watched keenly, as upon it depend so much of the course of the other lines of lumber. Red cedar shingles are very weak. Clears are selling at $2.97 and stars at $2.44, Chicago basis. At these prices, sales have been unusually heavy. White cedar shingles are steady and quiet. The demand for lath is unchanged and prices are steady. Cooperage trade conditions continue unsettled.

Buffalo:—The trade in northern pine is of fair volume, but prices continue low and buyers seem to be in control. In spite of this however, there seem to have been more sales recently than during the

SARNIA ONTARIO

month of September. At North Tonawanda the trade in northern pine is reported to be improving, the greatest activity being among the low grades, especially box. Prices are unchanged and show no tendency to advance. It is expected that the supply at the close of navigation will be about as usual. An improved demand is noted for hardwoods, though trade is by no means brisk. One of the best selling lines is maple, the upper grades of which are firm and the lower grades quiet. There is a good demand for birch and prices are firm. Plain oak is strong but quartered oak still remains dull. There is a fair trade in elm, ash, and chestnut. A fair movement is reported in hemlock, but prices do not improve. Most of the buying is for immediate use. Southern pine is firm, at slightly improved prices. It is very difficult to secure deliveries, on account of the shortage of cars and this is assisting the price in its firmness. Shingles and lath still continue weak and stocks are heavy.

Bay City and Saginaw:—An improvement in the northern pine trade is reported. Enquiries are a little more numerous, for certain lines, but prices have not strengthened. Considerable strength is noted among the better grades.

Market Correspondence

Marked Improvement in Montreal Trade

Montreal, October 26.—On every hand one hears continued reports of good business. Some put this down to the rejection of reciprocity. One dealer reports that trade has improved since the change in government, but others declare it is a mere reflex of the general satisfactory conditions, and, locally, of the activity in building. Whatever the cause, there can be no doubt that a good business is being done and is looked for for some time to come. One wholesaler states that he has refused orders—he could not obtain the lumber—being strictly a seller's market, he also anticipates an advance in prices. The one drawback is the great scarcity of cars and boats, which is handicapping trade to an extent which is calling forth general complaint.

Some wholesalers anticipate a large shortage in the cut of lumber, on account of the low water at the mills; in Quebec a few mills have already closed down.

An indication of the good times locally is that planing mills are working to their fullest capacity, and that it is difficult to get work done for immediate necessities. Hardwoods are in request, particularly oak and chestnut; but quartered oak is a trifle slow and birch a little easier in price. Cedar shingles are also enjoying a good market, while hemlock finds practically no buyers. Prices of lath continue firm, in consequence of the demand and a lessened output.

There are many buyers for spruce, and the Campbell-MacLaurin Lumber Company report that in the New York market 1-in., 1¼-in. and 2 in. x 9 in. x 13 ft. has advanced a dollar to two dollars per 1,000 ft. On account of the scarcity still higher prices are expected before spring.

Cooperage firms are sharing in the general prosperity; most of them are exceptionally busy, some working day and night. There is, however, a lack of skilled workmen. Most of the British coopers who came to this side have to be trained in Canadian ways, and when this is done, many of them go West.

Dealings in dimension timber are still few, and are not likely to increase until the new government settles down. The holding-up of certain contracts given just before the Liberals went out of office has restricted transactions, and those who are working on old contracts find themselves hampered owing to the fact that funds have not yet been voted by the new Parliament. For the time being, therefore, things are to a large extent at a standstill.

Exporters are still rushing lumber to British ports, and find themselves faced by the shortage of cars and the congestion which followed the strikes on the other side. With prices keeping steady, a fair number of orders is coming to hand.

Ground wood pulp is a very strong market, owing to its extreme scarcity. There is practically no ground wood pulp available at any of the mills, and the production is sold ahead until the first of January. Water power is very low—lower in fact in Quebec province than for many years, and appearances point to a continued shortage in pulp unless there are heavy rains for a long period. News paper in Canada seems to be sold up for a considerable period. Representatives of big paper brokers in the United States have been on visits to Canadian mills recently, but find that there is no unsold paper to be obtained for at least six months. Chemical pulp is also scarce, owing to the low water conditions. There is a good demand throughout the country, and mills shipping to the United States are sold right up to the present production. Consequent upon these conditions, the price of sulphide has risen a dollar per ton since our last issue. The general outlook for the paper and pulp business of Canada is distinctly promising for the fall and winter.

An Off Season on the North Shore

Thessalon, Ont., October 25.—This is an off season on the North Shore. There will be a heavy falling off in the output this coming season. Some of the firms are not doing anything this season, and everybody to-day is curtailing. The large mills of Waldie Bros., at Spragge, has closed down for the season and has cut more lumber for the time running than ever it has. The remainder of the mills will run till the ice stops them. The Thessalon Lumber Company have not put in any camps yet but reports say they intend to organize shortly.

The great difficulty in operating this season is scarcity of men for the woods. It is almost impossible to get wood men at present. Wages are from $28 to $35 per month, which makes the cost of production very high. The price of lumber is off and it is hard to sell. The yards on the Shore are filled with white pine lumber and there are prospects for any rush of orders this season.

There will be considerable board lumber got out on the Shore this season. There is good demand for timber in England. The Thessalon Lumber Company have cut some very fine board timber out of their stock at the mill this season and shipped by rail to Quebec.

The Lumber Trade in the United Kingdom—Improvement General

Liverpool, Eng., Oct. 17.—The consumption of Quebec pine deals, and of New Brunswick and Nova Scotia spruce deals is proceeding on a satisfactory scale in the principal English ports. A great change for the better has taken place since the work of unloading ships was resumed on something like normal lines after the strikes, but the transportation of timber from the ports, to towns inland, is still being done with difficulty. The railway companies have not recovered from the effects of the transport workers' strike, and are only moving goods, at the present time, at about three-quarters of the scale and rate which importers and manufacturers require, so that dock guays, yards, stations and sidings are still in a state of glut and confusion. But as regards the "trade" which is behind it all, this is in a fairly satisfactory condition. An improvement in trade has taken place at all of the large ports and at most of the large cities, since the railways and dock workers' strikes came to an end.

At London, Canadian spruce and pine are in more demand. Stocks are very light and prices are very firm, and a hardening is confidently looked for. The export branch has been more active, but business in this branch is impeded by the high freight rates which are now asked. The public sales have been well attended, and bidding has been brisk enough to indicate that consumption was going on satisfactorily.

At Liverpool the output from yards has been on an increased scale and stocks of yellow pine deals and of New Brunswick spruce and pine deals are still light. Oregon pine has moved more freely and the stocks of this wood are much smaller than at the corresponding date in 1910 or 1909. Birch logs are in good demand and wood of prime quality is advancing in price.

At Manchester, spruce is more called for and stocks are below the normal compass. Quebec board pine has passed more freely into consumption and is still in good requset. On the north-east coast, ship-building and coal-working are active and the condition of these main industries is reflected by the timber trade. Deals have been in more demand, and spruce for case-makers' uses, has sold very freely. Pitwood has been taken in large quantities and is still passing steadily into consumption.

At Glasgow, pine and spruce deals have been more inquired for and stocks of pine are now light. Oak and elm logs continue in good demand, the former being taken largely for wagon work. Shipbuilders are actively employed and are making a good and steady demand for wood of the kinds used by them.

The packing-case makers of London have now been actively employed for a long period. In view of the increasing cost of coal and other commodities and of labor, the case makers have decided to increase their prices for cases, from 5 to 10 per cent. This particular branch of the trade is making a very large and continuous demand for spruce, though it is not stated that the advance named is being made on account of the price of this chief raw material of the industry but on account of the other items spoken of.

Canadian, U. S. and English Situation

The failure of the Canadian Liberal Government to carry through their projected reciprocity agreement with the United States, was a matter of great interest to timber importers in England, especially to those engaged in the Canadian timber trade. Since the reciprocity scheme was broached, importers in the U. K. have been wondering

how the importation of Canadian timber to the U. K. would be affected if the scheme were carried into effect. The general belief has been that it would have proved almost fatal to the trade in Canadian timber with the United Kingdom, as the trade in such timber with the United States would, it was believed, have increased so greatly that Canada would have had little timber to spare for the U. K. or for anywhere else, when the United States had got from her all they were prepared to take. The nearer the conditions of trade between Canadt and the United States approached to free trade, as England understands it, the smaller, it is believed, would the trade in timber between Canada and the United Kingdom have become. It will be seen therefore, that the situation possessed elements of great interest to importers of Canadian timber in the United Kingdom as they found themselves confronted with a probability that they would shortly be without supplies of Canadian timber, and without a prospect of being able to obtain further supplies of such timber. To importers in England this would have meant a temporary inconvenience. If they had found their supplies of Canadian wood stopped, they would have turned to Baltic or North-sea ports for white wood and to the United States for pitch-pine and other woods. English importers would not have been losers, when once the re-adjustment of the stream of supplies had been made. Presumably, also, the Canadian exporters would not have been losers either, for though they had stopped the supply of lumber to England, they would have been sending the timber, and probably more of it, to the United States. Apparently no loss would have been sustained by anyone, whereas, a gain would have occurred to Russian or Scandanivan exporters of timber, as they would have had to make up the shortage caused in the United Kingdom by the witholding of the Canadian timber. The present situation, in view of the failure of the reciprocity scheme possesses interesting possibilities. It is believed in England that an effort will now be made to obtain the removal of the American tax on Canadian timber and so to establish free trade in timber between Canada and the States. Should this be done, Canadian timber will, it is said, cease to be sent to the United Kingdom as the United States will be able to take as much lumber as Canada can let her have. The question importers are asking is, whether the Canadian branch of their trade is about to be taken from them. The answer will depend on the course which the United States and Canada pursue in view of the fruitless attempt to carry the reciprocity treaty into law. English importers who have been for many years in the Canadian timber trade, would regret to see that branch of their own trade slip away from them but they will be powerless in the matter. It is for Canada herself to say whether or not she will continue to make a steady and valuable contribution to the supplies of timber received by the United Kingdom from overseas, or under a system of free trade, confine her dealings in timber with her next door neighbor. For the present, things will, presumably, remain as they have been. Canadian exporters will continue to make contributions to the supply of spruce and deal, oak, birch and elm required by the United Kingdom, and the English importers will continue to receive and handle the goods to the advantage of all concerned.

The Late David Jardine

On October 7 Liverpool was shocked by the announcement that Mr. David Jardine had passed away suddenly at his residence, High Lee, Woolton. The deceased gentleman was in his eighty-fourth year, and for nearly half a century had occupied a prominent and distinguished position in the arena of public and mercantile life at Liverpool. For many years, prior to a comparatively recent date, Mr. Jardine was senior partner in the firm of Farnworth and Jardine, probably the oldest firm in the timber trade in the United Kingdom, and a firm with a world-wide reputation. The business of the firm was established about 120 years ago by a Mr. Dempsey, who was joined by a Mr. Frost, the style of the firm becoming Dempsey, Frost & Co. Mr. Jardine entered the service of the firm as a youth, in 1842. In 1848 Mr. Dempsey, the founder of the firm died. About this time the late Mr. John Farnworth became a partner in the firm. A man of strong religious convictions and with a large sense of public duty, he entered freely into church and philanthropic work in the city, and became Mayor of Liverpool. Meanwhile Mr. Jardine had acquired a thorough knowledge of the timber trade, and of the firm's business, and had shown ability and probity which greatly impressed Mr. Farnworth. When therefore, the public service which he was doing in the city made large claims on his time, Mr. Farnworth intrusted much of the responsible work of the business to Mr. Jardine. Mr. Frost died shortly after, whereupon Mr. Farnworth admitted Mr. Jardine to a partnership in the business. Mr. Peter Owen, who attained celebrity in the timber trade was also admitted to the firm in 1861. For many years the business was carried on at offices near the Brunswick,dock, Liverpool; the great timber dock of the port at that time. Later, offices and yards were taken at the Canada-dock, which had become the seat of the timber trade at the north end of Liverpool. The business now attained vast dimensions and became really world wide. Public sales by auction were established and were held at regular intervals, and were attended by buyers from all parts of the kingdom, and often from distant parts of the world. Timber from all parts was sent to the sales and the sale-room of Farnworth and Jardine at the Canada-dock, Liverpool, became of world wide note, as a resort of representatives of the timber trade. The business done by the firm, as selling brokers, became of enormous proportions.

Mr. David Jardine entered largely and heartily into the mercantile life of Liverpool. In 1876 he was elected a member of the Mersey Docks and Harbor Board, a position which is regarded as the premier mercantile honor—the "blue-ribbon" honor, it is termed—of the Port of Liverpool. While a member of the Board he served on the Works, Docks and Quays, Finance, Parliamentary and other committees. From January 1884 until December 1890 he was chairman of the Finance Committee of the Board. He also enjoyed the distinction of being one of the first directors of the Cunard Company, joining the board in 1880 and serving for many years on the board of this famous steamship company. For several years Mr. Jardine was deputy chairman of the company, and also chairman of the Executive Committee of the company. On the death of the first Lord Inverclyde, Mr. Jardine became chairman of the Cunard Company. This position he held until his retirement from the board of the company in 1902. Mr. Jardine was connected with several other companies in Liverpool, among them being the Royal Insurance Company, the Standard Marine Insurance Company, and the Pacific Loan and Discount Company; of each of which he was a director. Though so far advanced in years, he attended every day, practically to the last, to his own business and to the duties of his different directorships. Since 1879 he had been a Justice of the Peace of the City of Liverpool, and give much valuable service as a magistrate.

The remains were interred at Smithdown road Cemetery, Liverpool, on Tuesday afternoon, October 10; in the presence of a large gathering representing almost every branch of public and commercial life in Liverpool; the timber trade and the Presbyterian Church, of which he had long been an honored member.

A Bay City lumberman, operating a mill plant in the Georgian Bay district, reports that lumbermen there already have their camps established. He estimates the log output this coming winter at about 80 per cent. of the average. Some manufactured lumber is accumulating there on the mill docks, but much of this season's cut was contracted for early in the season. Nearly all Saginaw valley buyers secured their stocks last winter by contract. The market is steady and the better grades of lumber are exceptionally firm in price. Reports from lumbermen operating camps are that a fair amount of help is available, and more will be offered when crops have been harvested. Experienced men are scarce, however.

Gordon, Grant & Company, of Port-of-Spain, Trinidad, report as follows under date of Oct. 2:—

Lumber and cooperage materials.—No further arrivals of pitch pine have taken place, and a cargo or two of suitably assorted quality should be saleable. We expect the schr. Rhoda from Liverpool, N. S., at any time, with a cargo of pine, spruce and hemlock boards, for which class of lumber there is a constant demand at full rates.

S. P. Musson, Son & Co., Barbados, report under date of Sept. 30 as follows:—**Lumberstuffs.**—We have no landings of white pine or spruce to report since our last. There is a good opening for a couple of cargoes which would meet with ready sale. White Pine—We value at about the same as recent prices, viz.: $31.50 per M. for merchantable, and $24 per M. for second quality. Spruce—We value at $25 per M. for shipping and $21 to $20 per M. for second quality. P. Pine—We note the arrival of about 163 m. ex S.S. "Tyrm" from Mobile, which was placed to arrive, at $33.25 per M. for merchantable, all heart, and $26.50 for second quality. Shingles—No arrivals since our last. We have recently sold a cargo of one million and a half Extra No. 1 Extra Cedar Laying at $2.05, and we understand a cargo of about 2 million have since been sold at $2 per M. Shooks—We have to report the arrival of the 4-mstd. Schr. "Augustus H. Babcock" from Portland, Me., with a cargo comprising 22,930 bdls. Hhd. Shooks, and 2,350 bdls. Brl. Shooks—about half for selves. The Hhd. Shooks were sold sometime ago at $1.95 per bdl. for oak, and $1.85 per bdl. for hardwood. We also note the arrival of 1,089 bdls. Hhd Shooks ex Stmr from Halifax, on importer's account. Wood Hoops—No arrivals.

The National Wholesale Lumber Dealers' Association will hold its next annual meeting on Wednesday and Thursday, March 6th and 7th, 1912. The place has not been decided upon.

Hanchett Band Saw Sharpener
For Saws up to 14 inches wide

The Filing Room

Look at this new band saw sharpener. It isn't exactly new, for a good many of them have been in use for some time in some of the largest and best mills in the United States. Besides, it is our same old Hanchett No. 2 band saw sharpener, fitted with internal gear drive. By simply shifting a lever several different speeds may be instantly had while the machine is in operation, or the machine may be instantly started or stopped by the same lever.

It is fitted with either friction or gear drive without extra cost, and changes from gear to friction or vice versa may be made at any time at a trifling cost.

It is solid, rigid and free from vibration. Weight 1800 lbs. Send for Circular No. 5.

MAKERS:

HANCHETT SWAGE WORKS
Big Rapids, Mich., U. S. A.

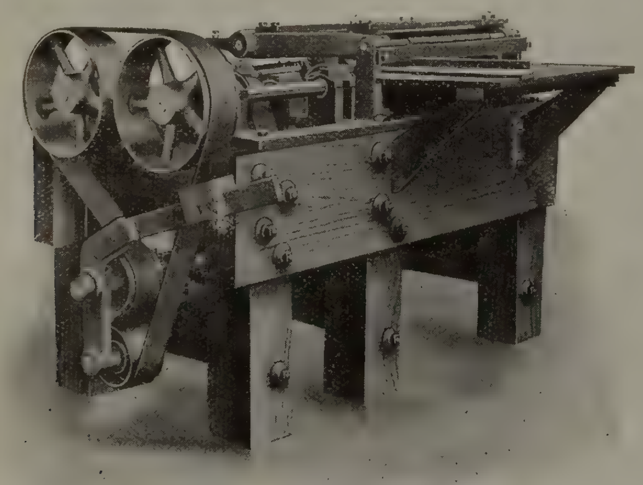
(Continued from page 43)

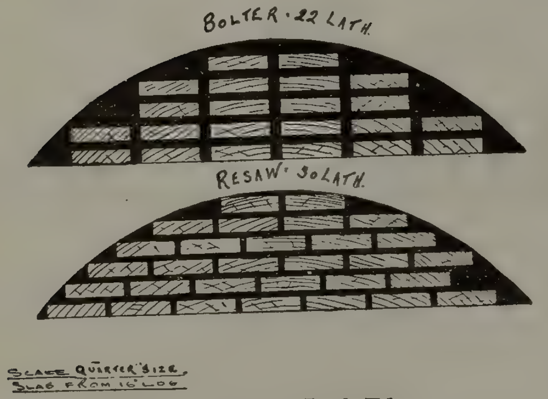
stays and tips are sewed by double lock-stitch wax thread machine. Among the many new improvements are found those sizes from 10 to 17 inches which have solid tram hooks on all high cut shoes which enables the user to remove the shoe in one half the time.

With excellent shipping facilities by both lake and rail and a large staff constantly employed, Mr. Todd is in a position to fill orders on shortest notice. He does not confine customers to the ordinary styles, models or sizes, but can turn out anything in the shoepack line promptly, on a customer's order. He makes a specialty of shoes for the harvest field for Western Canada, in russett or oil-tanned stock, manufacturing also leggins, shoepacks and larrigans, sheaths and belts and complete outfit in leather for hunters, prospectors, sportsmen and lumbermen. The "Polar Bear" brand which Mr. Todd's lines will be known by, bid fair to become very popular from coast to coast.

The Mereen-Johnson Lath Edger

A lath edger of exceptional merit is illustrated herewith, which is the product of the Mereen-Johnson Machine Company, Minneapolis, Minn., U.S.A. A study of the diagram also reproduced will show the great economy of labor and material obtained by manufacturing lath on a slab resaw and lath edger. It permits the use of cheaper labor, less men per thousand lath and gets more lath out of every slab handled, besides getting number one lath out of thin slabs which would be worthless under other systems.





The Mereen-Johnson Lath Edger

A cast-iron frame completely encloses all working parts, and all the boxes except one are cast in this frame, which insures perfect alignment. This frame is bolted to a heavy wooden frame which is securely bolted together and completes a very substantial construction.

The saws are spaced to rip one and one-half inches wide. The first saw cuts one and one-half inches from the guide so there is no waste on straight edge stock, while stock without a straight edge is fed through at random.

The arbor has three boxes, one on each side of the drive pulley and a moveable box at the opposite end. The frame at this end being in the shape of a "U," the saws will pass off without moving the arbor. The box has a fitted seat and can be removed by hand in a few seconds which enables saws to be changed in a few minutes without opening a single box.

The saws are 16 gauge, 10 inches in diameter, 2 7-16 in. hole, 50 teeth. The arbor pulley is 7 inches by 6 inches and should run 3,000 r.p.m. Spacing collars are furnished to set 9 saws to cut 1½-in. lath. The machine uses 5 h.p. and occupies 3 ft. 9 in. by 4 ft. 1 in. of floor space. Its shipping weight is 1,400 lbs.

A Practical Store Coupon System

An ingenious and useful coupon book system for the use of lumber firms and in fact for all who conduct a store at which their employees purchase supplies, is manufactured by the Southern Coupon Company of Birmingham, Ala. The basis of the system is a small book of coupons representing five cents each or in some cases one and two cents each. These books are issued to the employees who sign a note for them or pay for them in cash. In the latter case it is possible to offer a small discount for cash payments. By the use of this system it is possible to place the business of a company store immediately on a cash basis, and at the same time to reduce greatly the intricacies of account keeping. An employee making a purchase presents his book to the clerk who detaches coupons to the amount of the purchase. When a book is issued to an employee the value which it represents is deducted from his next time check. In addition to placing the store business on a cash basis this system will please employees as it does entirely away with any possibility of his being improperly charged with accounts which have been run by other employees. It also induces employees to bring all their business to the store and not trade anywhere else. An interesting advertisement of the Southern Coupon Company appears in this issue.

Death of Burk's Falls Lumberman

The death occurred recently, at Toronto, of Mr. Wm. Train, for many years a resident of Burk's Falls, Ont., who was well known as a lumberman, in Vaughan township, Parry Sound district. Mr. Train who was living with his son, Mr. G. T. S. Train, in Toronto accidentally left the gas turned on in his room and was found unconsciousness the next morning. Being 74 years of age he was unable to overcome the effects and succumbed a week and half later. Mr. Train was born in Vaughan township, in 1838, and owned and operated lumber and flour mills at Thompsonville, Simpson county.

New Mills for Port Alberni

It is reported that a sawmill with a cutting capacity of 75,000 feet per day is to be established by the Canadian Pacific Lumber Company in Port Alberni. The machinery is under order and will begin to arrive shortly. It is expected that the new mill will be in operation before the first of February next. A shingle factory, with three machines, will also be operated by the same company. The present Barclay Sound mill, which is slightly out of date, will be almost entirely removed. The plant and buildings will cost the company $50,000. There is no shingle mill attached to the company's plant in Vancouver, and shingles for the Vancouver trade are to be manufactured in Port Alberni.

Lumber Market Overworked

A Spokane, Wash., despatch says:—Salesmen returning from the provinces of British Columbia, Alberta and Manitoba, report that the lumber market is being overworked. Better conditions are looked for there later in the season following the harvesting of crops. However, considerable lumber is moving into the provinces at the present time, several million feet of which is produced in the Inland Empire mills. Stocks are heavy in Calgary at the present time. They also say that the action of the mountain mills in reducing the price of lumber $2 per 1,000 feet with an extension of credit by invoicing the shipments November 1, is having an effect on local shipments. The object of the mountain mills in making this concession is to cut down the shipments from the American mills.

Richelieu Lumber Company Elects Officers

At a meeting of the shareholders of the Richelieu Lumber Co., Limited, held at their offices, 52 St. James street, Montreal, October 19th, the new permanent Board of Directors were elected and officers appointed for the ensuing year. The following were elected:—Mr. J. H. Rainville, M.P., president; Mr. Samuel Tarrante, merchant of Montreal, first vice-presiden; Mr. J. S. Beauregard, broker, Montreal, second vice-president; Mr. G. A. Fowler, lumber agent, C.P.R., Montreal; Mr. Jno. R. Flynn, contractor, St. Agathe; Mr. Ulric, St. Jean, merchant, Contrecoeur, P. Q., and Mr. J. B. Dupuy, M.P., manager of the Caisse d' Economie, Contrecoeur. Mr. Flynn was appointed secretary. The general superintendent of the mill at Bonaventure River will be Mr. Marcoux, formerly proprietor of a large saw mill and sash and door factory at Berthierville, who suffered a complete loss of his plant by fire in July last. Mr. Marcoux has had a wide experience, and will have charge of operations representing a cut of 15 million feet of spruce and pine and between 40 and 50 million shingles. The selection of a general manager has been left open for a short time pending the acceptance of proposals to the board of a well known Montreal lumberman. The company has already taken large contracts for next spring for lumber and railroad ties.

EDGINGS

Ontario

The Preston Furniture Company of Preston, Ont., are building a new dry kiln.

Thomas McKee, Toronto, is advertising his planing mill and lumber business for sale.

A woodworking and sash and door plant will be established by Mr. Smith at Walkerton, Ont.

The Montrose Paper Mill have decided to erect a log conveyor for their new stock yard at Thorold, Ont.

The Foster Armstrong Piano Company, Berlin, Ont., are planning to double their factory in the near future.

The New York and Pennsylvania Pulp & Paper Company of Johnsonburg, Pa., are considering the erection of a pulp wood and paper mill at Cobalt, Ont.

Rankins, Limited, with a capital of $30,000, and head offices in Falding, Ont., has been incorporated to acquire, own and lease timber lands, licenses and limits, as well as logs and hemlock bark.

Neil Watson's stave and lumber mill, at Blenheim, Ont., was destroyed by fire, on Oct. 18th. The loss is placed at $6,000, and the insurance amounted to $1.500. Mr. Watson has not yet decided whether to rebuild.

J. W. Dalton, Limited, has been incorporated with a capital of $150,000, head office at Stoney Creek, Ont., to manufacture and deal in logs, timber, wooded lands, machinery appliances, &c. The provisional directors are T. H. Burcher, W. J. Quirmbach and H. T. Canniff, all of Toronto.

Eastern Canada

Lacasse and Frere, Montreal, have been registered as sash and door manufacturers.

The saw mill of Dosithe LeBlanc, at St. Louis, Que., has been destroyed by fire. No insurance.

Jos. Bourgouin, lumber dealer, Cairnside, Que., is reported to have lost his stock by fire.

Laurence and Robitaile are reported to have dissolved partnership in their lumber business and Joseph Laurence is registered.

M. M. Tracey of Connecticut, has a proposition before the council of Cookshire, Que., for the establishment of a large match factory in the town.

The Nova Scotia Lumber Company with headquarters at Walton, N.S., are receiving tenders until Nov. 15th for the purchase of their lumber property near Economy in Colchester and Cumberland counties, N. S.

The Meyer-Thomas Company, manufacturers of wood boxes of all kinds have rented premises opposite their present factory at Granby, Que., and will probably be in the market shortly for new box-making machinery.

N. Mercier, Sr., Deziel street, Levis, Que., has nearly completed the erection of a 20 ft. x 25 ft. building in connection with his saw factory. The building, which is costing $,3000, is to be used for tempering steel. Mr. Mercier is now in the market for machinery.

Stanley Douglas, of Fredericton, N. B., has purchased the Fleetwood Block, near Stanley, on the Nashwaak River, in New Brunswick, which comprises aboue 3,000 acres of valuable timber limits, containing a large quantity of both hard and soft woods. The limits belonged to the Salvation Army.

Canadian Lumber Yards, Limited, Montreal, Que., have been incorporated with a capital of $1,000,000 to carry on business as manufacturers of lumber, timber, etc., proprietors of saw mills, lumber yards, etc. The incorporators are G. T. Penny, Geo. V. Cousins and S. T. Mains, all of Montreal.

The Gatineau Industrial Co., Limited, Hervey Junction, Que., has been incorporated with a capital of $200,000 to carry on business as lumberers, saw and planing mill owners, dealers in timber and timber lands, logs, etc. The incorporators are Thos. Malone of Three Rivers, Hugh Doheny of Montreal, Que.

The Canada Gazette reports charters granted to the following concerns: The Gatineau Industrial Company, Limited, to carry on the business of sawing, planing and manufacture of all sorts of wood goods, and also the manufacture of paper, at Hervey Junction, Que.; capital, $200,000; Canadian Lumber Yards, Limited, to carry on a general wood business, sawing, and manufacturing of wood articles of all kinds at Montreal. Capital, $1,000,000.

The formation of the Quebec Pulp & Paper Company, with a capital of $15,000,000 is announced. Mr. Rodolphe Forget, M.P., is prominently connected with the financial end of the company, which will include the Wayagamack and East Canada plants. It is also understood that negotiations are being conducted for the absorption of other paper and pulp companies, together with big timber limits. It is further stated that additional mills will be erected in the Province of Quebec.

The loss by fire at Blackader's mills at Weymouth, N.S., on October 4, is reported to have been in the neighborhood of $25,000. The insurance on the mills amounted to $4,000. The Sissiboo Lumber Company, which had a large quantity of lumber at the mills, carried insurance upon it to the extent of $13,000. The Blanchard Lumber Company also had a quantity of stock at the mills upon which they carried insurance amounting to $1,500. Only a small portion of the lumber was saved.

According to the annual report of the Laurentide Paper Company (now known as the Laurentide Company) for the year ended June 30th last, the profits after bond interest and other charges had been paid, was $713,539, compared with $516,304 the previous year. From the profits have been paid four quarterly dividends of 1¾ per cent. each on the preference stock, and five quarterly dividends of 2 per cent. each on the common stock, and $20,000 has been added to the depreciation reserve, leaving a balance of $362,171.14 to be carried forward. The gross profits were $909,582, of which $831,507 came from the ground wood, sulphite pulp, paper and cardboard departments, and $78,075 from lumber and miscellaneous. The authorized capital of the Laurentide Company, Limited, is $10,000,000, of which $7,200,000 is now issued, leaving $2,800,000 for the future purposes of the company. The exchange of all the issued stock of the new company for the shares of the old company gives the shareholders of the Laurentide Paper Company exactly the same proportionate interest in the issued stock of the new company as in the old. The first quarterly dividend on the new basis is 1½ per cent. at the rate of six per cent. for the year, but as the capitalization is now doubled the dividend is really at the rate of 12 per cent. on the old stock.

Western Canada

The Mostyn Lumber Company, Lestock, Sask., has been burnt out.

J. S. Grant, lumber dealer, Osler, Sask., has sold out to The Monarch Lumber Company.

The Renfrew Lumber Company propose to erect a new saw mill on Silver Creek near Hope, B. C.

H. H. Goertzen, lumber dealer, Morse, Sask., is reported to have been succeeded by Dewey Gardner Lumber Company.

The McLellan Lumber Company, 744 W. Hastings street, Vancouver, B.C., have commenced the construction of a saw mill.

The Schaake Machine Works, 325 Front street, New Westminster, B.C., have secured the lease of several water lots on Lulu Island as a site for machine works.

The Lindsley Brothers Company, Spokane, Wash., specialists in cedar poles, have opened an office in Calgary, Alta., with Mr. G. U. Bacon in charge as resident manager.

The planing mill belonging to Mr. T. A. Burrows, at Birch River, Man., was recently destroyed by fire. Several cars of lumber were also destroyed. The loss is covered by insurance.

The James Richie sawmill plant at Bridesville, B. C., have been offered for sale. Tenders were received by J. R. Martin at Bridesville until Oct. 20th. The result has not yet been reported.

Indications are that over 150,000,000 feet of lumber will be cut in the woods of the Prince Albert, Sask., district during the coming winter. It is estimated that between 5,000 and 6,000 men will be required.

The Arkansas-Vancouver Timber and Lumber Company Limited, Vancouver, B. C., has been incorporated with a capital of $2,000,000 to carry on a general saw mill, logging, shingle mill and lumbering business.

Victoria Shingle Mills, Limited, Victoria, B. C., have been incorporated with a capital of $10,000 to carry on business as lumber operators, timber merchants, and general contractors for public and other works.

A large new sawmill is to be established on the banks of the Fraser river in the near future by the British Canadian Company, a new corporation. The new mill will represent an investment of about half a million dollars, and it is said that the work will be hastened so that the mill will be ready for cutting in the early spring. The new plant will be run by electricity, and every modern appliance known to lumbermen will be installed. There will also be a large box factory in connection with the sawmill.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

926. **Veneer crates.**—A Cuban importer would like to correspond with exporters of veneer crates.

927. **Box Shooks.**—A firm of commission merchants would like to hear from manufacturers of box shooks.

932. **Lumber.**—A commission merchant in Havana would like to correspond with Canadian exporters of lumber.

939. **Broom sticks.**—A commission firm can handle large quantities of broom sticks on commission.

941. **Lumber.**—A leading firm of commission merchants would like to correspond with Canadian exporters of lumber.

993. **Lumber.**—A Bristol firm wants hardwood lumber planks, deals and boards, or cut to sizes; also dowels, blinds, rollers, etc.

1019. **Wood pulp boards.**—A Yorkshire firm are in the market for wood pulp boards and would like to hear from Canadian manufacturers.

1058. **Lumber.**—A firm of commission merchants in Havana would like to correspond with exporters of lumber.

1059. **Box shooks.**—A Cuban firm would like to hear from Canadian manufacturers of box shooks.

1037. **Lumber.**—A Cuban firm is in position to handle lumber on commission.

1070. **Wooden crate material.**—A firm of lumber dealers in Bermuda would like to hear from Canadian lumbermen supplying wooden crate material.

1083. **Wood pulp boards.**—A Lancashire firm dealing direct with English slipper makers, wants quotation on wood pulp boards suitable for slipper making.

1088. **Canadian pine.**—An importing timber firm in Carlisle and Glasgow would like quotations on what is there called yellow pine, but is known by either white or Norway pine in Canada. Specifications will be furnished on application to the Department of Trade and Commerce.

1089. **Canadian pine.**—An important timber firm in Carlisle and Glasgow would like quotations f.o.b. Montreal or Quebec on white or Norway pine 3rd deals and 2nd or mill run sidings.

1109. **Wood working machinery.**—A South African manufacturer's agent wishes to get in touch with Canadian manufacturers and exporters of wood working machinery.

1171. **Lumber.**—Canadian exporters of lumber are requested to correspond with Cuban commission merchant.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

ARE YOU SUFFICIENTLY INSURED?

SPECIAL RATES TO LUMBERMEN

NO PAINT Ever Needed on this Roofing
ATLAS PORTLAND CEMENT CO.
HANNIBAL, MO. covered with over
200,000 Sq. Ft. of J-M ASBESTOS ROOFING

The need of paint or gravel on a roofing is positive proof of its weakness—positive proof that the materials in the roofing would dry out, rot, rust, decay or otherwise deteriorate without such protection—positive proof that the roofing itself can't last long unless protected with a **mineral.**

Instead of a perishable animal or vegetable material only **temporarily** protected with a **thin layer of mineral,** such as paint, slag or gravel, J-M Asbestos Roofing is **one solid mass of minerals.** Not a particle of perishable material in it.

J-M Asbestos Roofing consists of layer-on-layer of pure Asbestos Felt securely cemented together with genuine Trinidad Lake Asphalt. Asbestos is a rock, or stone, and of course, stone needs no paint to make it last. And the Asphalt Cement between these stone layers is the same mineral that has withstood the severe duties of street paving for forty years.

So J-M Asbestos Roofing is an **all-mineral** roofing.

J-M ASBESTOS ROOFING

is the **only** ready roofing that never requires a single cent's worth of paint or other protection. Its first cost is its **only** cost.

Other ready roofings are a continual trouble and expense—for the paint and gravel wash and blow off and have to be renewed every few years.

Because of its mineral or stone construction, J-M Asbestos Roofing is also rust-proof, rot-proof and acid-proof. And fire that will melt iron won't burn this roofing.

If not at your dealer's, our nearest Branch will supply you with J-M Asbestos Roofing.

Write now for samples and Catalogue No. 303.

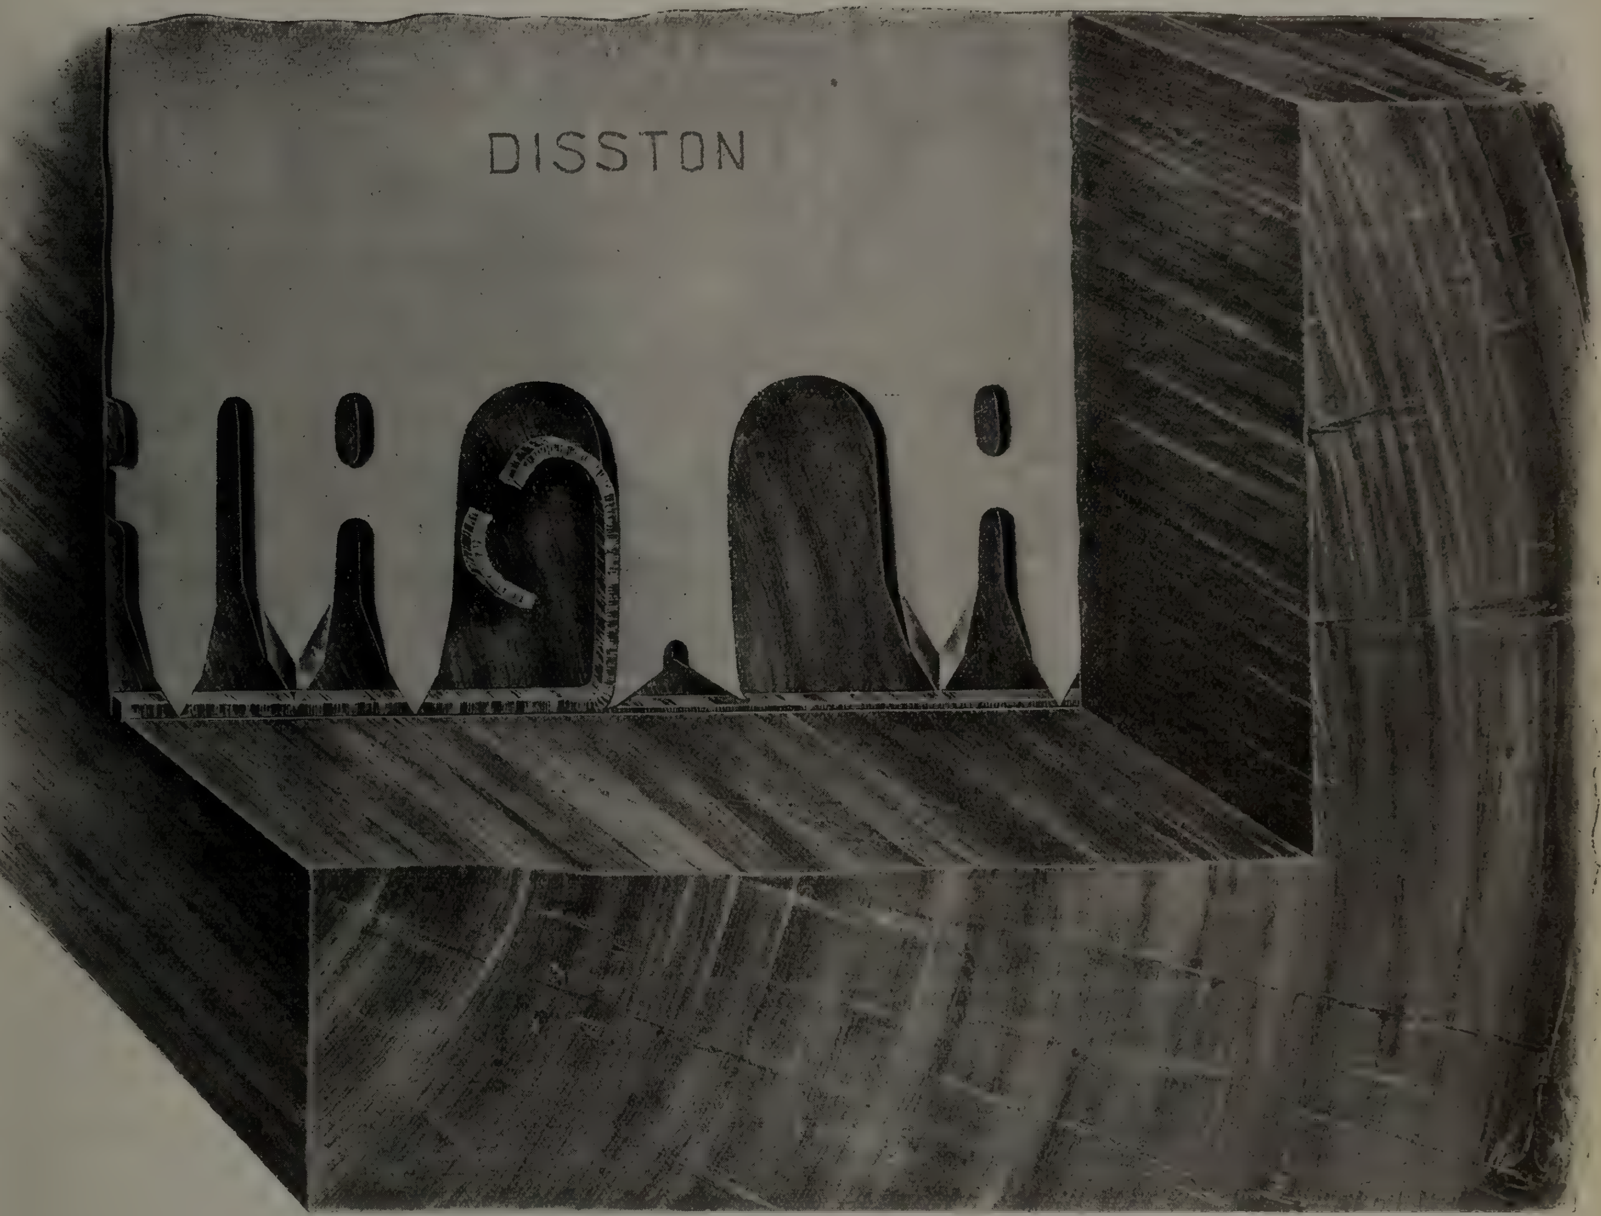
The RAKER

is the controlling power in Crosscut Sawing



"The question of length of "Rakers" or Cleaner Teeth is brought up from time to time by someone who has not been through the mill of experience, also the statements that the Rakers DO ALL THE WORK, should be on line or even with the cutting-points of the saw, etc., etc. This latter, of course, will appear ridiculous to experienced crosscut saw users, but, nevertheless, as new men are coming on the field all the time and do not possess the knowledge, an explanation is worth while, for quick progress can be made only in profiting by the experience of others."

The above is a quotation from our four page circular on "The Raker Tooth," the most complete article ever written on the subject. It's free for the asking—just drop us a postal giving your name and address, mentioning this journal.

A grade test on No. 2 stock

Any matcher can be made to do good work at slow rates of feed on straight grained lumber.

But any old machine will not produce perfect work on knotty or cross-grained stock.

There's where the science of thin knife use comes in as used on Berlin fast-feed matchers.

Yet you would expect an ordinary machine to produce as much No. 1 stock at 30 feet as a Berlin fast-feed matcher at 160 feet.

Still here's a comparative test sent to us by an enthusiastic user who found out the difference by a simple test.

He put through 150 pieces 1x8-16 all No. 2 grade in the rough which manufactured up as follows:

The old-style	**1 pc.**	**No. 1**
machine handled ——	**111 pcs.**	**No. 2**
it in 47 minutes	**38 "**	**No. 3**

Then he put through a Berlin fast-feed matcher 150 pieces No. 2 in the rough as follows:

The Berlin	**31 pcs.**	**No. 1**
machine handled ——	**103 "**	**No. 2**
in 16 minutes	**16 "**	**No. 3**

You can figure out the saving for yourself. What would it amount to in a YEAR'S time?

Go and see for yourself

The above figures came to us from a Montana plant. They will be gladly verified upon request.

Go and see one of the late Berlin fast-feed matchers running—see the quality of work it will turn out.

Photographs may secure your order—enthusastic letters from your friends may hasten your buying—go and see.

Then you will come back absolutely satisfied because you have seen our machines produce perfect flooring, perfect profile work at fast feeds.

There's nothing so convincing as one's eyes—then you know what a Berlin fast-feed matcher will save for you.

What the new Berlin Matchers do

One Berlin fast-feed matcher will raise your grades by not tearing out knotty and cross-grained stock.

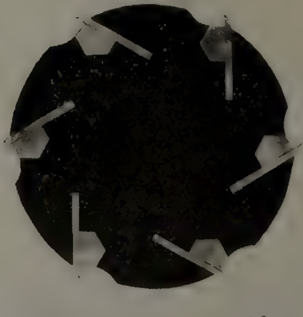
This not only applies to flooring, ship-lap and four-side work, but to your profile work as well.

Drop-Siding ordinarily run at forty to fifty feet per minute can be manufactured at 150 to 250 feet per minute.

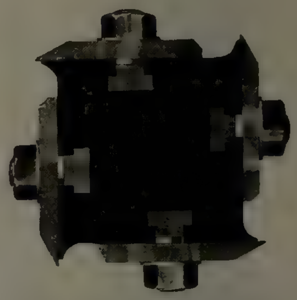
At 150 feet, consider the enormous saving in labor cost alone which, added to a splendid saving in grades, makes a Berlin fast-feed matcher a fine investment.

With the profiling attachment, simple and perfected as we have it, your drop-siding work is dependent on the machine, not on the operator's skill with soft steel.

He has heads fitted with milled steel bits for producing your various patterns and he has only to grind their beveled edge.



This head carries six steel knives set at an angle which will not tear out knotty and cross-grained stock.



You cannot "joint" or true these knives and the angle of knife cut must always remain the same. This head spoils an immense amount of lumber.

The securing of perfect work is not entirely left to the operator as before.

How Grades are raised

Above we illustrate the new Berlin Six Knife round head and the ordinary four size square head.

About 70% of the plants still use the older method of working both plain and variety work.

The square head tears out because each knife is set at a right angle. The knife strikes the stock, cuts, tears up and would rip the board to pieces were it not for the chip breaker.

The angle of the round head knives may vary. The thick knife angle is always the same. The thin knife "scrapes"—it does not tear out.

Hardwoods and soft woods may be planed with the correct angle for the hardness or softnes of the wood. Knots and cross-grained places are planed as readily as straight lumber.

Our booklet, "Thin Knife Use," covers the subject quite thoroughly. Copy sent gladly upon request.

OILDAG

(REGISTERED TRADE MAKR)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99 of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

CONSERVATION

NOT FOR SENTIMENT BUT FOR PROFIT

With the increased value of timber lands to-day, owners are beginning to realize the need and importance of systematically handling their lands. Forest holdings can be made to bring a financial return in a remarkably short length of time and for an indefinite period thereafter, by using our methods of mapping, estimating and surveying.

A Large Land Company's Opinion of Our Work

"Just the Information Wanted"

Samuel F. Hersey Land Company,
Bangor, Maine.
Branch Office, St. Paul, Minn.
St. Paul, Dec. 22, 1909.

Gentlemen,—

In reply to your inquiry of the 15th inst., we desire to say that the forestry work you did for us this year is entirely satisfactory to us. Your report and map were comprehensive and gave us just the information we wanted.

We shall undoubtedly call upon you again for further services of this character.

Very truly yours,
Samuel F. Hersey Land Co.,
D. A. Mudge, President.

Messrs. Appleton & Sewall,
Bangor, Maine.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts showing character and quantity of available timber, including the most approved methods of cutting each year so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

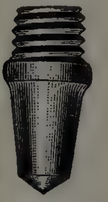
NEVERSLIP
Red Tip
HORSE SHOE CALKS

are the best for Heavy Hauls on Steep Grades

Neverslip Red Tip Calks are peculiarly adapted for use in Lumber Camps and Lumber Yards, where deep ruts make footing uncertain and steep ice covered mountain grades make a fall a serious accident.

A horse that is continually sliding and floundering loses confidence in itself, becomes nervous, and generally incapable of the work expected of him under less adverse circumstances.

Neverslip Red Tip Calks overcome all such conditions of winter travel, makes the horse secure of footing and in that security fully able to cope with sleet and storm and do the average day's work.



The horse shod with Neverslip Red Tip Calks can negotiate any hill however slippery and circuitous routes, taking valuable time of men and teams are unnecessary.

In preventing accident the Neverslip Calk preserves the usefulness, perhaps the life of your horse, and pays for itself many times over.

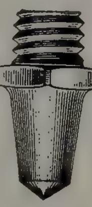
RED TIP

Every owner of horses knows the loss in time occasioned by having men and horses waiting around a blacksmith shop to have horses sharpened. It may be a matter of an hour, sometimes the best part of a day, before your turn comes and when business is pressing such delay means loss of money.

A new set of Neverslip Red Tip Calks can be inserted by your shoer in 20 minutes and once in are firm, secure and an integral part of the shoe itself, absolutely proof against wobbling or wearing loose and never breaking off.

Do not confuse the name Neverslip with cheap inferior calks that may be offered by unscrupulous dealers as just as good.

To protect you against fraud the genuine Neverslip Calks and Shoes have a RED TIP, which is a mark of quality and a guarantee that you are gettinge the best.



Look for the RED TIP and refuse substitutes.

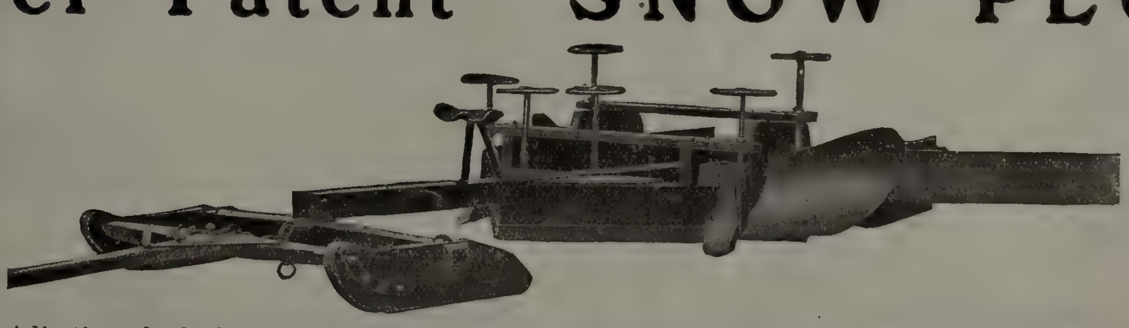
"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.



Combination Model, Lumberman's Snow Plow, can be used either with or without Ru Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of Mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

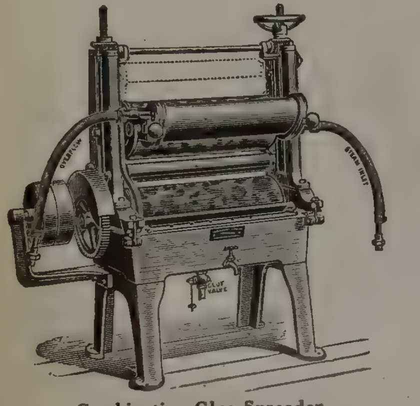
Francis Glue Room Equipment

Do you do, or contemplate doing — Gluing, Veneering, and Built-up Work? Do you realize the possibilities it holds out to you? Are you prepared for the necessarily large and increasing demand for this work?

What is your Glue Room Equipment, is it old, slow cumbersome, expensive?

If so, change, make a clean sweep, and the quicker you do so the better it will be for you. The cost of installation will soon be forgotten, but the improved equipment will create and hold business and be a constant source of profit and satisfaction.



Combination Glue Spreader
(12 in. to 84 in wide.)

Wrestling with makeshift or obsolete equipment doesn't pay; sooner or later the change must be. Look, inquire, take note of the Francis Modern Outfits and you will want to do what leaders in your own line have done—install a complete Francis Glue Room Equipment.

Glue Heaters, Joint and Panel Glue Spreaders, Iron and Steel Hand Screw Veneer Presses, Clamps, and the Open Side Hydraulic Veneer Press with Single Beam Retainers (also adapted to Hand Screw Presses) and quick loading and unloading arrangement for practically unlimited capacity.

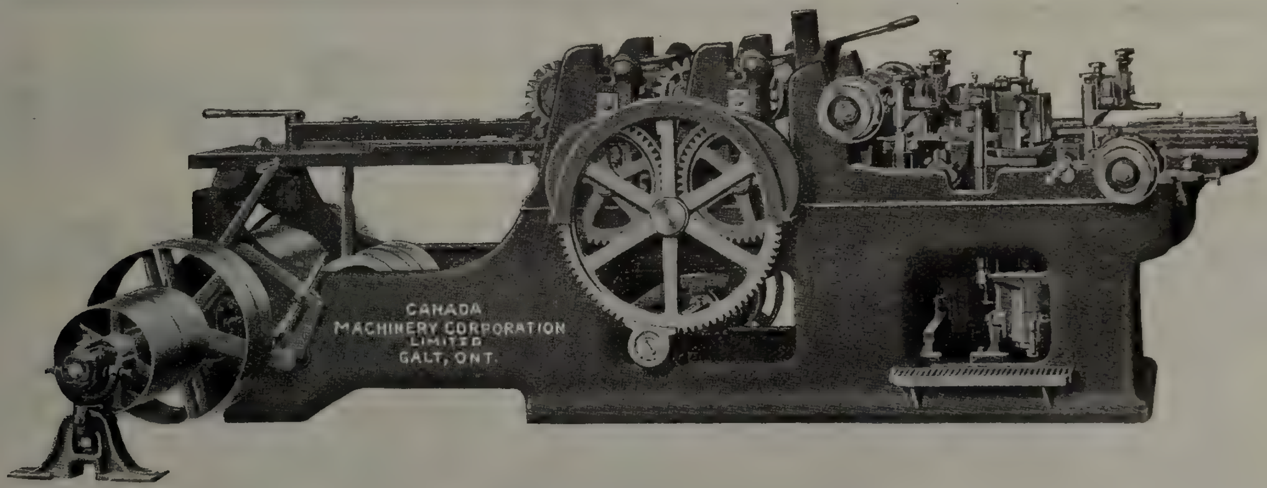
No. 300 Heavy Duty Inside Moulder

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.



No. 300 Heavy Duty Inside Moulder

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

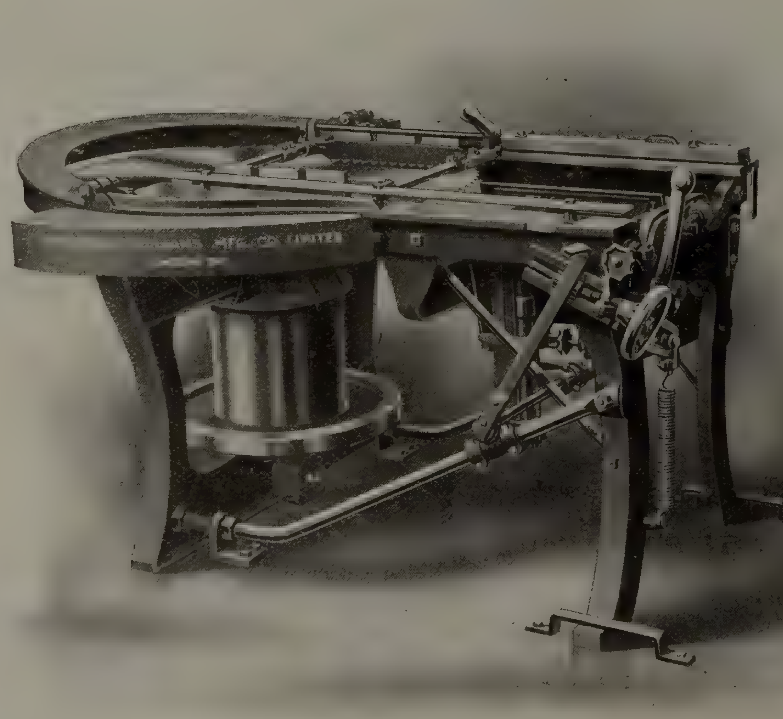
Market and Louise Sts., WINNIPEG, MAN. - - 115-125 Adelaide St. West, TORONTO



Perkins' Shingle Machine

Hand Feed

THE FRAME of this Machine is Cast Iron heavily ribbed. All parts securely bolted together.

TO GIVE saw lead shift the screws in rear and front of arbor bridge pot box. No danger of heating box or disturbing alignment of frame in so doing.

TO TIGHTEN main drive belt turn the nuts on outside of L shaped standard fastened on to foundation skids. This draws the machine away from the line or counter shaft. Machine must be placed on and fastened to a level and solid foundation, one that is straight and out of wind.

BALANCE WHEEL PULLEY. Experience teaches that a pulley of this design enables the machine to be driven full capacity with a belt two inches narrower than where the balance wheel is omitted. It also maintains a more uniform motion, as the intermittent strain thrown on the arbor and driving belt in the act of sawing is overcome by the momentum of the mass of metal in the balance wheel. Pulley is turned inside and out, securing a perfect running balance. A Removable Cast Iron Cover keeps all refuse and sawdust out of the pulley.

A Band Resaw with Service Built Into Its Every Line and Part—

The new No. 257, like all other Fay & Egan Band Resaws, is built to stand hard work, and lots of it. That's one reason why Fay & Egan Band Resaws are running in every part of the world. There are other reasons too—we'll be glad to tell you about them upon request. A special reason for the great success of the No. 257 is its wide range, resawing stock up to 28 inches wide and 20 inches thick, and doing it on High Speeds.

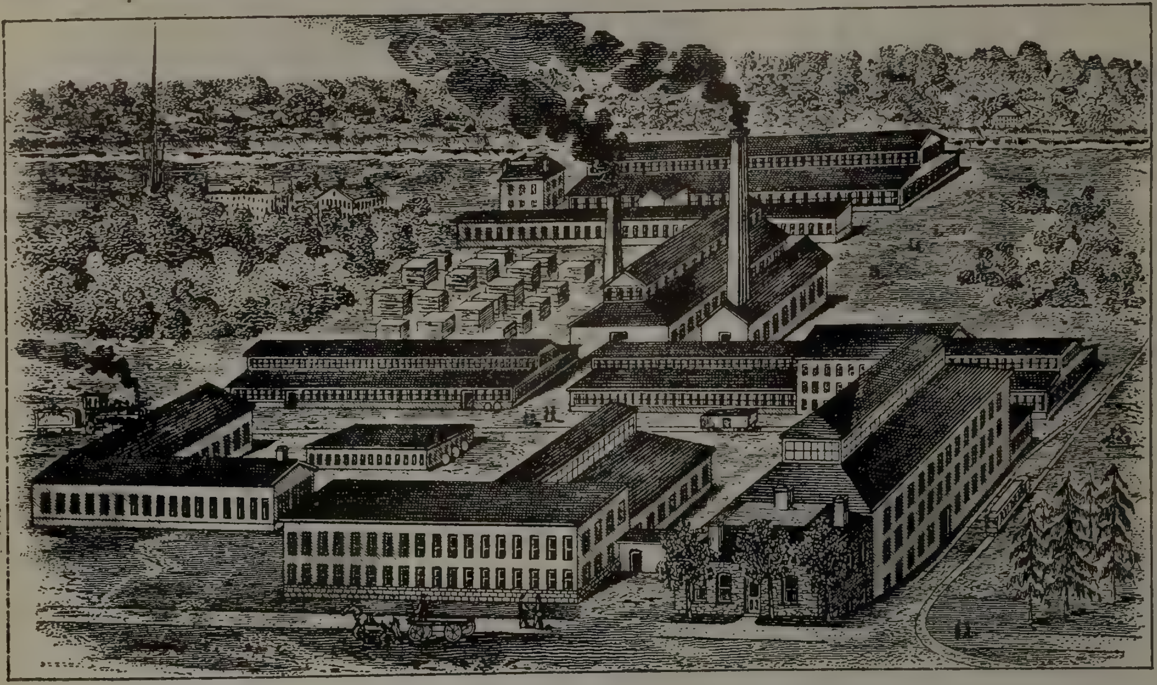
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

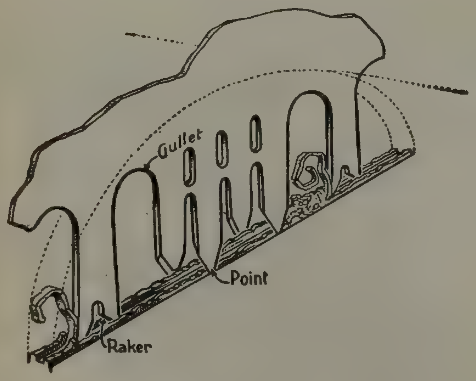


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

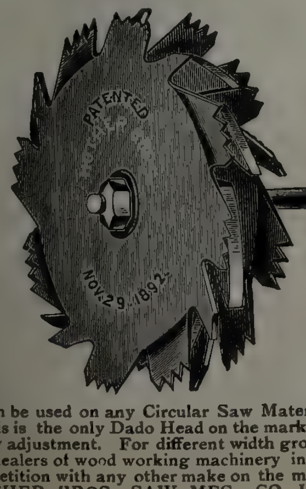
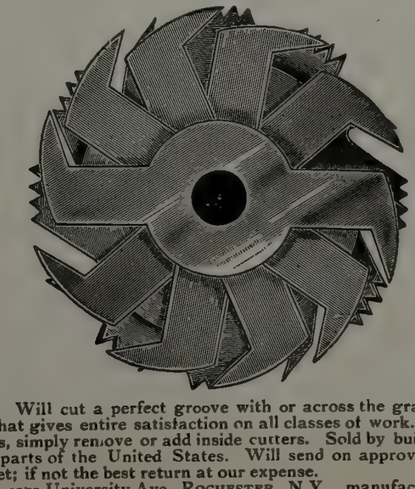
HUTHER BROS. PATENT GROOVER OR DADO HEAD
For cutting any width groove from one quarter inch to 2 inches or over

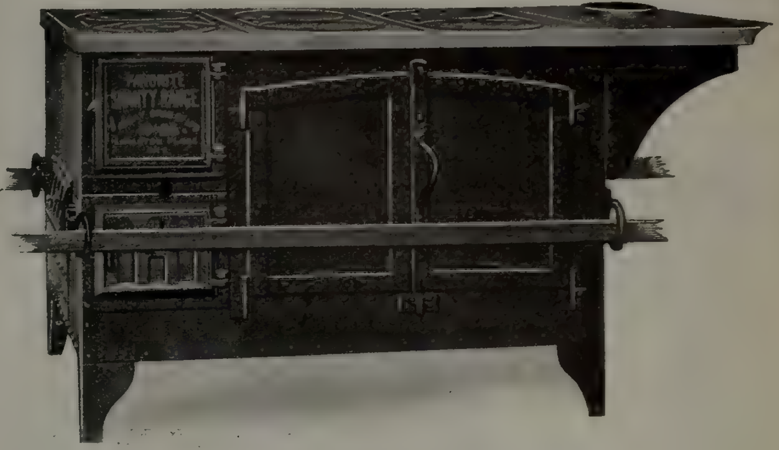




Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain.
This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.
HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturer of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps



This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

Note the malleable lift rings to accomodate poles for the portaging of the Range. This is a handy feature only found on the Favorite Shanty Range.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

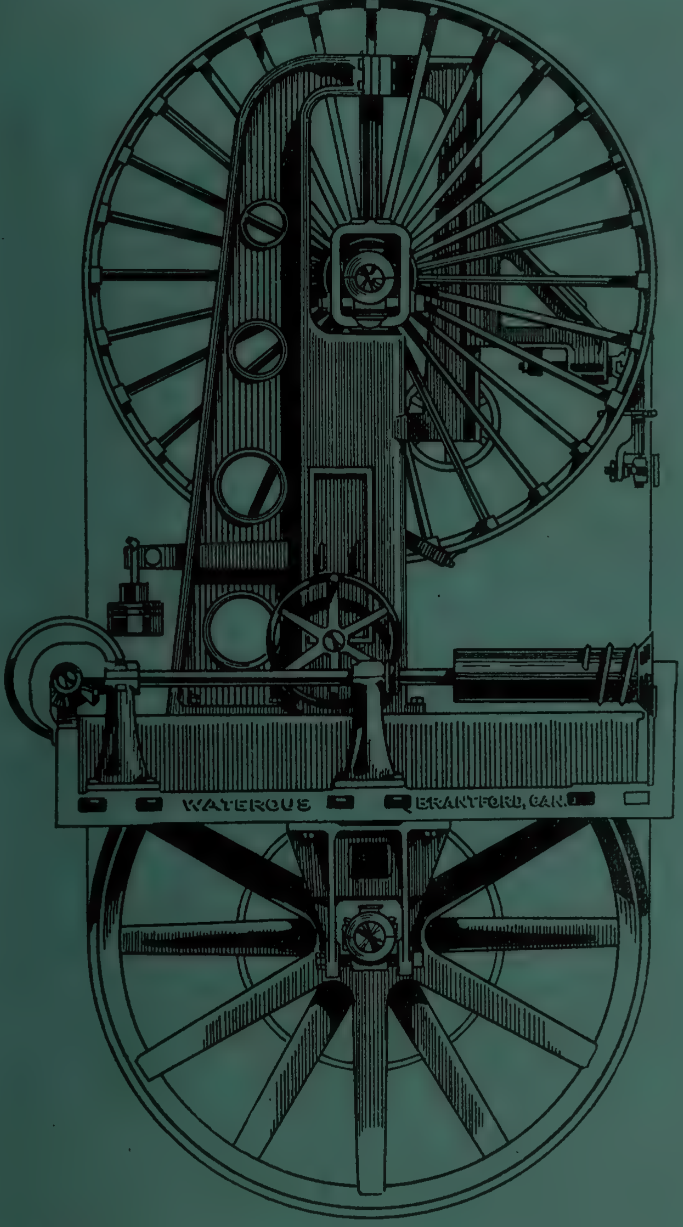
"WHY" and "HOW"

We Build a 7 ft. Band Mill



It will take a saw up to 12-in. blade, will split a 36-in. log, has all the fast cutting features of the larger sized mills and yet represents a saving of several hundred dollars in initial expense, in up-keep in saws and in filing tool equipment.

Although containing all these fast-cutting features, we are able to build this, 7-foot mill cheaper than would be possible if we had not already done the expensive experimental work and tested these features out on our heavier mills. All you pay for is the cost of construction.

WHY—

Because there is a demand for a mill that will handle logs of fairly large diameter—that, is larger than can be cut on a Pony Mill—that will cut faster than the Pony and at the same time will be less expensive than the heavy 8 ft., 9 ft., and 10 ft. mills on the market at the present time.

The Waterous 7 ft. Band Mill fills these requirements in every particular.

HOW—

The Waterous 7-foot Band Mill is built right and left hand for single or double cutting. **The frame** extends completely around the mill, is very wide and deep, carries on it all feed rolls, etc., to make the machine entirely self-contained. **Columns** are a combination of box and girder section, of graceful business-like design, have wide bearings on the frame and grip the mandrel supporting posts above and below the mandrel. The long recess in the columns permits an exceptionally long vertical adjustment of the upper wheel.

Both wheels are built on old designs that have proved themselves practically perfect in weight proportion and smooth running qualities. **Mandrel boxes** are adjustable in all directions, are extra long, babbitted with finest bearing babbit, and are chambered for water cooling.

Tension and tilting device and raising and lowering mechanism are those supplied on our heavier mills. They are completely enclosed within the columns where they are kept absolutely free of sawdust, slivers, etc. A large door in each column permits of ready overhauling. **The tension device** has been in use for several years and has proved itself second to none on the market. Every fulcrum point is double knife edged and weights are carried on self-cushioning springs which absorb sudden shocks and jars that might affect the saw. **The raising and lowering** is effected by means of a hand wheel and double threaded jack screw working in the bottom of upper mandrel supporting posts. Jack screws are connected to raise and lower upper mandrel in perfect line.

Both upper and lower guides swing exactly about the centre of saw blade, both are instantaneous opening, with wide space between jaws for quick removal of sawdust and slivers. **Upper guide** is particularly rigid, is provided with safety slide, has brass plug contact with saw blade and water lubrication. It is raised or lowered by a special **steam raising device** or by hand wheel and chain—both giving positive and rapid movement. **Lower guide** can be operated from front or rear of mill as desired. Live rolls are carried on the frame, a bevel ended worm roll as illustrated being supplied with double cutter, speed 400 feet per minute.

The bystanding cut made from the machine drawing itself, shows the graceful, clean-cut, business-like design of this mill. Every part is built to combine strength and rigidity, and the mill is put together by experts in this work. We test every machine before it leaves the shop.

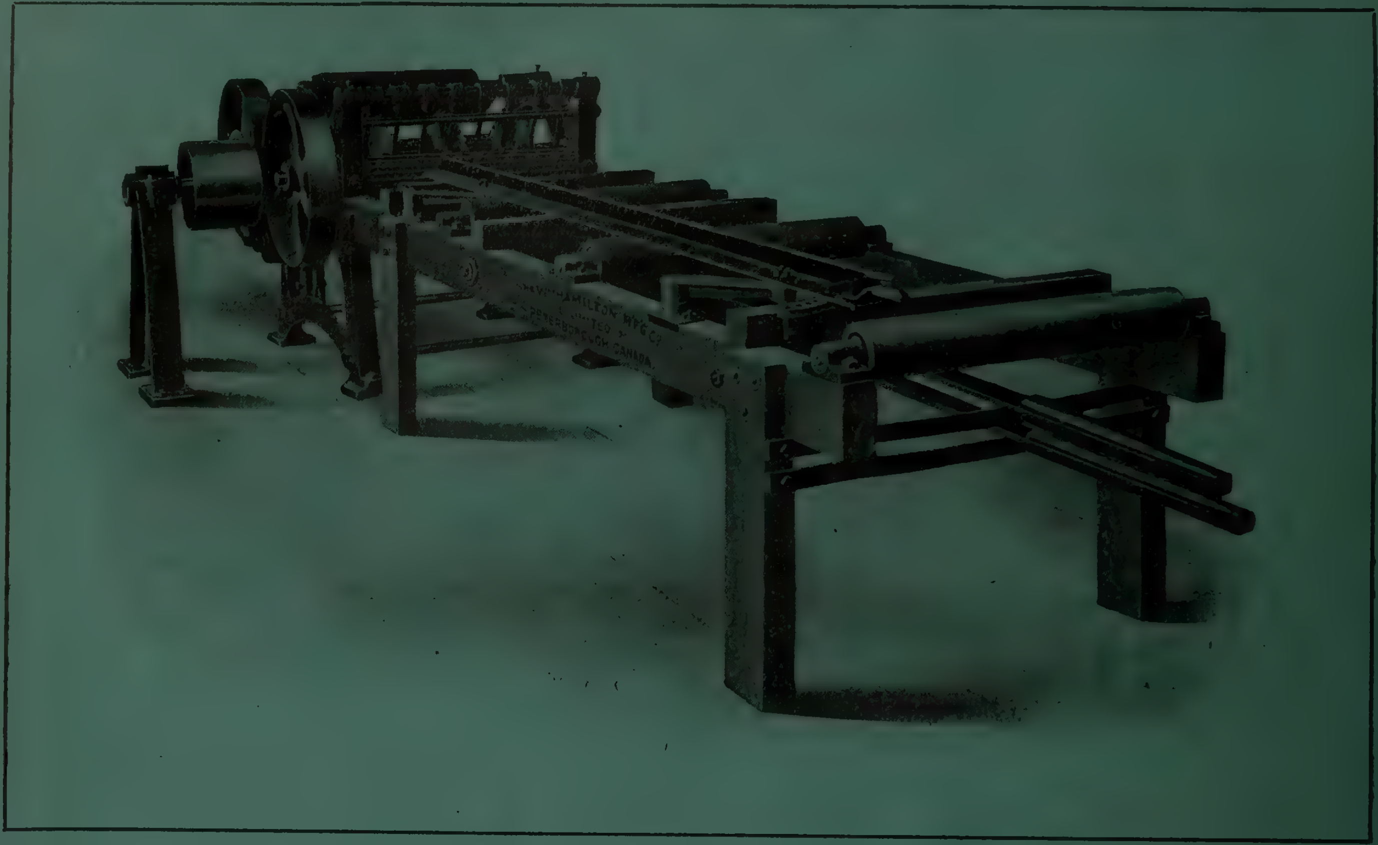
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

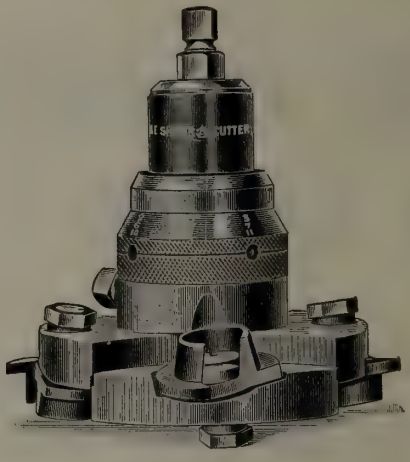
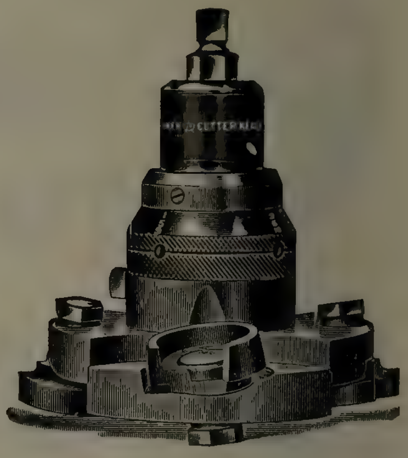
MILL MEN,
STOP
THE
LEAKS!





You would not tolerate leaks in your boiler and system of steam pipes because you burn coal without receiving value therefor, and sustain not only inconvenience and absolute loss, but deterioration of property through neglect as well. Yet you permit a good workman to labor earnestly and faithfully, but unsuccessfully, in an endeavor to make things count by sharpening and fitting Straight Bits day after day, resulting in needless waste of time and effort when The Shimer Cutter Heads and Bits will save all of the fitting. Do you see the force of this comparison.

Stop the little Leaks that Curtail your Output. Use the Shimer Cutter Heads

It has been demonstrated many times that monies invested in a small outfit of the Shimer Cutter Heads will save their cost within a few weeks use. They are, therefore, GOOD TOOLS TO DEPEND ON year in and year out. They are built for business, having within their make up the principles required to reduce to a system the routine of keeping the knives in perfect order.

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

LIGHT SAW KERF

The Wickes Gang takes out a minimum of saw kerf, hence gives yon the maximum of lumber from the log.

Sawdust pays you nothing; make as little of it as possible.

Twenty gauge saws in hardwood, eighteen and sixteen in fir and pine, these are everyday records made possible by the patented perfectly equalized saw tooth action of the new models of Wickes Gang. This means more boards from wide cants, boards instead of slabs from the sides of narrow cants.

A Band Mill Without a Peer

Best balanced and most symmetrical band mill ever designed

The despair of imitators
Built with 6, 7, 8, 9, 10 and 11 foot wheels
Does not overhang its foundation
Is the heaviest band mill built
Also the perfection of simplicity
It holds all the cutting records
Has the greatest range of top wheel
Double spring cushion tension device
Steam straining engine when specified
Quick opening bottom guides
Bottom guide completely buried in husk frame
Safety upper guide
Steam controlled upper guide when wanted
Steel spoke V section bottom wheel
Chain oiling bearings
Hubs are longer than on any other brand
This insures a very rigid wheel
Wheels tilt from front and rear
The standard of excellence
Every feature original with us
We build every machine required in an up-to-date mill

GOODYEAR

Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which *all stretch has been taken out.*

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—*all* mills where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. ***Outlives, outlasts*** all other belts.

Rot-Proof Mill Fire Hose

Goodyear Underwriters is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. ***Won't*** harden or crack with age. Special circular woven fabric with least expansion or elongation under pressure. Antiseptically-treated to make it rot and mildew proof.

The strongest, most reliable hose for all mills and factories. Insist on ***Goodyear Underwriters, the hose with the black and yellow stripes.***

Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thickness of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and chipping. Gives longest, most enduring service.

We also manufacture other rubber goods such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

TERMS OF SUBSCRIPTION:
Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3,00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, November 15, 1911 No. 22

Lumber Imports Greatly Increased

The foreign trade of Canada in forest products for the month of July and for the four months ending with July 1911, published by the Department of Trade and Commerce shows some unusually interesting developments. Chief among these is the great increase which has occurred in the imports of wood and manufacturers of wood from the United States. The total imports under this heading from the United States for the four months period were valued as follows: 1911, $6,713,222; 1910, $5,465,154; 1909, $3,687,981. As compared with 1909 therefore, the increase for the four months period was no less than 82 per cent.

The total value of imports of wood and manufactures of wood for the month of July was as follows: 1911, $1,385,553 of free goods, of which $1,374 was from the United States, and $455,933 of dutiable goods, of which $384,767 was from the United States; 1910, $1,120,755 of free goods, of which $1,102,298 was from the United States, and $341,374 of dutiable goods, of which $288,090 was from the United States.

For the four months ending July, the imports of wood and manufactures of wood were valued as follows: 1911, $5,202,898 of free goods, of which $5,136,181 was from the United States, and $1,834,480 of dutiable goods, of which $1,577,041 was from the United States; 1910, $4,310,332 of free goods, of which $4,255,750 was from the United States, and $1,411,849 of dutiable goods, of which $1,209,404 was from the United States; 1909, $2,808,098 of free goods, of which $2,776,042 was from the United States, and $1,051,854 of dutiable goods, of which $911,839 was from the United States.

Turing to the exports of wood and manufactures of wood the government statistics show that during the 4 months ending with July Canada exported these products as follows: 1911, $14,975,791; 1910, $17,287,492; 1909, $16,405,168. For the month of July the exports of wood and manufactures of wood were valued as follows: 1911, $5,669,328; 1910, $6,140,699. There has been therefore a marked decrease in the exports of wood and manufactures of wood during the four months ending July 1911, as compared with both 1910 and 1909.

The exports of wood and manufactures of wood for the United States for the four months ending July were valued as follows: 1911, $9,736,186; 1910, $10,930,484; 1909, $10,384,066. The exports of wood and manufactures of wood to the United Kingdom, for the four months ending July were valued as follows: 1911, $3,637,909; 1910, $4,627,993; 1909, $4,421,335. The exports under this heading to both the United States and the United Kingdom therefore show a decrease as compared with those of the corresponding months of 1910 and 1909.

For the month of July, Canada's exports of forest products were valued as follows: 1911, $5,157,959; 1910, $5,703,238; 1909, $5,964,863; 1908, $4,917,686. For the four months ending July, Canada's exports of forest products were valued as follows: 1911, $13,277,229; 1910, $15,749,503; 1909, $14,806,225; 1908, $13,432,481.

Canada's imports of lumber, timber, planks, boards, etc., for the month of July were valued as follows: 1911, $1,128,496 of free goods, and $43,800 of dutiable goods; 1910, $830,852 of free goods, and $27,791 of dutiable goods. For the four months ending July the imports of lumber, timber, planks, boards, etc., were valued as follows: 1911, $4,087,326 of free goods, and $208,791 of dutiable goods; 1910, $3,291,204 of free goods, and $78,047 of dutiable goods; 1909, $2,083,096 of free goods and $34,110 of dutiable goods.

Canada's exports of forest products for the twelve months ending with August 1911 amounted in value to $42,504,086, as compared with $48,247,176, for the twelve months ending August 1910; $42,607,983 for the twelve months ending August 1909, and $41,898,191 for the twelve months ending August 1908.

Among the individual items it is interesting to note that exports of pulpwood to the United States for the four months ending July decreased from $2,409,818, in 1910 to $1,862,944 in 1911. The latter figure is smaller even than the total for the same four months of 1909, which was $1,991,391. The exports of pulpwood on the other hand show a small increase amounting in value to $1,394,604 for the four months ending July 1911, as compared with $1,292,730, for the corresponding period of 1910 and $1,369,825 for the corresponding period of 1909.

Exports of timber for the four months were valued at follows: 1911, $255,933; 1910, $397,806; 1909, $284,940. Exports of lumber for the four months were valued as follows: 1911, $10,553,545; 1910, $12,180,602; 1909, $11,945,228.

The exports of shingles for the four months show a considerable falling off amounting in value as follows: 1911, $543,848; 1910, $608,613; 1910, $282,908.

Striking Example of Wasted Timber

A report which has recently been made by Dr. B. E. Fernow, Dean of the Faculty of Forestry of the University of Toronto, upon the forest conditions in the northern parts of Peterborough and Victoria and Haliburton Counties, is of much interest to lumbermen because of the fact that the country reported upon was in its earlier days similar to much of the lumbering country of Northern and Western Ontario. "The first impression that would strike an observant person in travelling over this country," says Dr. Fernow, "is the utter lack of rational management of the original timberlands which has given rise to these waste areas. For, the creation of these wastes, produced entirely by the inconsiderate use of the axe and carelessness in permitting fires repeatedly to run over the slashed areas, could have been avoided without foregoing any of the advantages which have been derived from the timber by lumbermen or government from their exploitation. I mean, all the timber could have been cut and yet the producing power of the land not be reduced. Where there are now hundreds of square miles of valueless brushlands and naked rock desert there could have been left a valuable forest, by this time nearly ready for a new harvest, the basis of a thriving lumber industry.

"This part of the country, the townships of Harvey and Galway, is located on Laurentian rock. This statement is significant for it pictures at once to the initiated the soil conditions, which are typical not only for this country but for a large part of Northern Ontario and Quebec, so that the problems in Peterborough county are also the problems for thousands of square miles, East, North and West. It means a meagre and thin soil overlying the rock, with only here and there pockets of larger and better soil accumulations where farming is practicable. If there is such a thing as 'absolute forest soils,' this is the place to look for them. Practically, at least 75 per cent. of the country under consideration is fit solely for timber growing. Abandoned farms and others that ought to be abandoned, testify to the correctness of the diagnosis that this is for the most part not farming country. Trees can grow in fissures between the rocks, where tillage is precluded and grasslands are apt to dry out.

"This was originally a forest country, all over more or less of the same type, a mixed forest of hardwoods with pine, hemlock and spruce; the hardwoods prevailing on the better, loamier soils, the conifers on the poorer, sandier soils. Practically the whole area is robbed of its values, fires have repeatedly swept over the slash denuding the soil of its vegetable mould, and rainwaters have washed away the unprotected soil, in many places creating real rock deserts. A growth of almost useless aspen and birch has established itself where the fire has not run through for a number of years, and a small crop of pine or spruce conifers has come in by natural seeding, wherever the cutting of old timber of the kind had not been too close and seed trees had been left—not by design, but by accident. There is still the possibility of reclaiming most of this area, but the story of the Sibylline books may repeat itself: each year's delay means a decrease of the chance of recovery."

Dr. Fernow then deals at considerable length with the problem of rendering these vast areas productive. His proposal, briefly, is that the Dominion Government, through the Conservation Commission should take up the work of reforestry.

To the lumbermen of Ontario the lesson of these counties is contained in the utter ruin and waste resulting from methods of operation which permit of ruthless cutting and devastation by fire. The methods of operation have fortunately undergone much improvement since the days when these countries were laid waste, but there is even to-day the utmost necessity for conservative methods of lumbering and above all for the adoption of a really effective method of fire protection on Crown lands. The matter is of concern to the province as much as to the Dominion and is in fact one of the most serious duties confronting the governments to-day.

From Wholesaler to Consumer—A Menace to the Trade

When it comes to a question of ethics, the lumber trade can furnish probably a more varied assortment of difficulties than any other known to modern commerce. From the time a lot of lumber leaves the mill yards until the time it is hauled over to the consumer it carries with it an infinite range of possibilities in the way of misunderstandings, and unfortunately also in the direction of unfair business behavior. Each branch of the lumber trade and industry—the manufacturer, the wholesaler and the retailer—comes in for its share of trouble and of blame from time to time, and any efforts which are made in the direction of smoothing out these difficulties are deserving of sympathetic attention.

The retail dealer is the butt of a large share of the complaints which are made, yet he has also his own share of the troubles which surround the sale of lumber. He is, in fact, more deserving of sympathy in this connection than any of the other branches of the trade. What with long credits to grant his customers and the urgency of his wholesale supply houses for payment for their stocks, he is often between two pretty fierce fires. There is, therefore, a good deal of excuse for the retailer if he complains when he finds a wholesaler coming into his territory and selling large orders to big consumers. Sometimes it is not even the large orders which are filched from his trade, as often a small consumer will secure his supplies direct from the wholesaler.

There is no intention in this statement to criticize the wholesalers as a body. Fortunately many of them—the majority of them, in fact—conduct their business upon strictly reasonable lines and realize that in avoiding the trade of the consumer they are to that extent strengthening the financial position of the retailer and making him an all the more desirable customer for themselves. The retailer is generally quick to appreciate the methods of such firms and to reward them with his trade whenever possible.

In spite of the evident folly of a wholesaler selling direct to the consumer, there are cases—all too numerous—in which the opposite course is adopted. Some wholesalers are a discredit to their trade, and go out after every sale, large or small, which is to be had anywhere within reach. They wonder then, why the retailer who has sized them up, gives them a cold reception. When they are turned down for some such reason they redouble their efforts in that district. They seek out everyone they can who may need a supply of lumber and they sell it to them at wholesale prices and sometimes at prices a little lower even than they would give to the retailer. It sometimes happens, of course, that the shoe is on the other foot, and that the retailer, by persistently playing off one wholesaler against another, merits the displeasure of the wholesale trade. A wholesaler, exasperated at last by this sort of thing, or perhaps by persistent delay in payments, decides to seek this retailer's trade no more, and naturally picks up other orders which he can in that district.

Taking it on the whole, however, the retail lumber dealer in Canada is deserving of the most reasonable and generous treatment possible. Upon him depends in a large measure the prosperity of the trade. He regulates in no small degree the demand of the consumer. By adopting proper and energetic business methods he sustains the demand, stimulates it when it is sluggish, and by keeping in close touch with the general economic situation of his district is able to put on the brakes or increase the speed of the trade whenever necessary. As a commercial safety valve he is an all-important factor of the trade. There are other reasons, however, for which the reputable retailer deserves the utmost confidence of the wholesaler and should be allowed to handle all the retail trade which may arise in his district. A retailer goes to a heavy expense to lay in a stock sufficient to meet the demand of his district. In most cases he gives the wholesale travellers a civil reception and an equal chance to secure his trade. The expense which he is at may properly be considered as having been incurred for the purpose of furnishing the wholesaler with an efficient means of supplying the material needed in the district. The retailer is the legitimate and natural sales agent of the wholesaler and he should be treated like all other sales agents —i.e., be given exclusive control of the territory.

Sometimes it happens that the wholesaler who has been able to sell an order to a retailer goes about the district approaching the consumer and prejudicing him against the retailer. The wholesaler who adopts this practice may make a better showing on his week's sales, but if he keeps a careful record he is certain to find, at the end of the year, that his sales in a district where he has done this, show a decided falling off. Common sense and ordinary honor should lead a wholesaler to avoid selling to consumers, and in most cases they do have this effect, but there are black sheep in every fold, and the wholesale lumber trade unfortunately is not an exception to the general rule.

There is another inference to be drawn from the practice of selling direct to the consumer. The wholesaler who does this may not be exactly of the class above referred to, but of even a lower class. This type of man is aptly described in a letter which was received by the Canada Lumberman recently. The writer says, "our opinion of a wholesaler who would do this is, that either he is entirely incompetent as a business man, or that the goods which he handles are so poor in quality and manufacture that no self-respecting retailer would handle them. Consequently he is forced to unload his junk wherever he can. A wholesaler whose stock is right in every way and whose business methods are clean and straight, need have no fear about being able to sell his goods to the regular trade. The fact that he has to peddle out his stuff in small lots to consumers proves conclusively that either he or his goods are below the mark."

Demurrage Charges—A One-Sided Rule

An article which was published in the Canada Lumberman of November 1st drew attention to the absurd situation prevailing in connection with claims by shippers for recovery of unjust overcharges and improper demurrage charges on the part of the railway companies. The railway companies are supposed to be in existence for the purpose of transporting freight and facilitating the expansion of commerce. It has become a policy of most of them, however, to do a great deal to hamper the development of trade and to place upon it many unreasonable drawbacks. The matter of demurrage, under its present conditions, is so entirely one-sided that it is strange that it has not long ago been altered. The railway companies are able to charge for any delay in the unloading of a car, but when, through their own negligence or inability, freight is delayed in delivery, the shipper has no redress. If he loses trade because he cannot get the railways to deliver his goods in time, he must suffer, and if he uses one of the railway company's cars a little longer than a stipulated time he must pay demurrage.

Either a system of reciprocal demurrage or one of average demurrage should be adopted so as to make the situation reasonable. If average demurrage were encouraged, it is more than likely that shippers, knowing that they would benefit by unloading their cars quickly, would see to it that there was no avoidable delay. The carriage of the country's freight would be facilitated and the railway companies would find that the earning power of their equipment had been increased considerably. But whenever the matter has been proposed before anybody competent to make the change, the railway companies have opposed it and have produced some of their employees to testify that average demurrage would result in delay to traffic. There may be some peculiar intricacies about the railway business which the lay mind is unable to grasp, yet the most natural tendency of a business man is to seize any method of saving expenses which presents itself. With the privilege of average demurrage it is inconceivable that a great majority of shippers would deliver up their cars unloaded at the first possible opportunity, so as to be credited with the time saved, on some future shipment which they might find it difficult to unload within the stipulated time.

Instances of the unfairness of the railway companies are continually being brought to the attention of the Canada Lumberman. Since the appearance of the article in the last issue of the Canada Lumberman a dealer advised us that he had many such difficulties to contend with and a typical example was as follows: He had two cars of lumber on order and they had arrived in his town, but had not been placed on the siding where he could unload them. It was six days after the arrival of the cars in the town before they were placed on the siding. All this time he was begging the railway company to place the cars and telling them that he was losing orders for the stock which the cars contained. He had to grin and bear it. Shortly afterwards another car was forwarded to him and he left it loaded a few hours after the time permitted. The railway sent him a bill for $1 for demurrage. This man however was the kind who does not allow himself to be intimidated without making a fight for it. He told the railway company to go about their own business and probably heard the last of the matter then and there. As the amount was small, the railway company probably did not think it worth while to make any fuss about it. Had the sum been a larger one, or had the shipper been a man of less backbone, the railway company would doubtless have pursued him to the end and either have obtained the money or have made it so uncomfortable for him that he would have been the loser. Apparently it is not a matter of principle with the railway companies, so much as one of getting from the shippers every cent that they can, by hook or by crook.

Shippers of lumber are as great sufferers from this as any other class of manufacturers and they should make some combined stand against it. They have fought out individual cases so often in vain that they should try now whether they cannot secure redress by a combined effort. The Railway Commission ought to be approached and an effort made to have them bring the railways to a state of reasonableness. If redress cannot be had from the Railway Commission it will be time to see whether the parliament of Canada will come to the relief, not only of the lumber shippers, but of the shippers of every article of commerce. The railways were intended to be efficient servants of the public. They are subsided and assisted in many ways with public money. Instead of being the servants they are fast becoming the masters.

A Question of Building Up Canada—Protection for Lumber

The Manitoba Free Press, considering it a sacred duty to criticize any efforts of the lumber manufacturing industry which would enable to to make as fair a profit as other industries, sees danger ahead in the discussion of a duty on lumber entering Canada which has been awakened by the rejection of reciprocity. No one will ever gainsay the propriety of protecting the consumer, the farmers above all else, from the extortions which follow upon the creation of a trust. But the opponents of a duty on lumber are at sea when they try to make the public believe that it would enable the manufacturers of lumber to extort an unreasonable profit from the farmers. The opponents of a duty would themselves be far from content in their own business enterprises if they did not produce any more profit than lumber manufacturers have been making during the last three years. The Manitoba Free Press infers that, any "invasion" which means cheaper prices for a commodity which is a necessity, is most welcome to the mass of the people of this country. This is true enough, but there is a reasonable limit to all kinds of protection and to the protection which the farmer secures at the cost of some of the most important industries in the land. It will be far from welcome to the mass of the people of this country if the lumber industry has to go through three more years like a few of those which has just passed, and the communities which profit by the demand created by the lumber industry for their own products would suffer likewise. The situation is not one to be discussed on the theoretical basis of free trade or protection. It is a question of the building up of Canada. Those who are in touch with conditions know that the lumber industry has lately had more to contend with in the form of demoralized markets than almost any other industry in Canada, and that it requires protection for its existence. To-day, in all parts of Canada, lumbermen are arranging their woods operations for the coming winter on a greatly reduced scale as compared with former years. Many who formerly found employment in the woods will thus be idle or be forced to look for work elsewhere. If a concrete example were needed of the results of the dumping of United States lumber in Canada, it could be furnished right in Winnipeg where The Free Press is published. Prices of dimension pine, spruce and tamarac have lately fallen $2.50, and pine timber $2 per M.

The Lumber Trade in Eastern Canada

News of the Markets in the Maritime Provinces and Quebec—Good Logging Weather in New Brunswick—The English Demand Improving

Ideal Logging Weather in New Brunswick

Fredericton, N.B., Nov. 8th.—The season so far has been an ideal one for the lumbermen. With an exceptionally dry October, the portage roads have been in much better condition than usual, making it possible to move camp supplies at less expense than usual, and also making it possible to pick up logs along the streams and smaller brooks where the ground is inclined to be boggy, and over which, with the ordinary season, it would be impossible to take horses.

A few of the St. John River mill owners seem inclined to take advantage of the lower wages prevailing for woodsmen this season, to cut quite as much as when the lumber market was in a much better condition than at present. The Fraser Lumber Company, especially, with mills at Cabano, P.Q., Baker Brook, P.Q., and at Plaster Rock and Edmundston, N.B., are doing this, they having splendid opportunities of holding logs safely from season to season.

This energetic and up-to-date firm made their first start in the lumber business in the year 1889, cutting that winter about 700,000 feet of spruce, cedar and pine logs on the Odell—a tributary of the Tobique river—which, with about 300,000 feet of logs bought from farmers along the river in that vicinity, they manufactured in a small mill at the mouth of River de Chute—a small tributary of the St. John river. From this small beginning the Fraser Lumber Company have rapidly grown, until the present time, when, with the Jas. Murchie Sons Company milling property at Edmundston, consisting of an up-to-date water power mill with capacity of about 40,000 feet of long lumber, and at least 60,000 of cedar shingles daily, and with upwards of 100 square miles of timber limits lying along the easterly side of the Temisconata river, in the Province of Quebec, just above the New Brunswick boundary, which they purchased early this year, they have handled upwards of 60,000,000 feet of lumber.

The British market is still in a rather sickly condition and values are unsettled. There has been some inquiry for special sizes, however, especially from ship-building centres.

Most of the local mills have finished sawing, and with the cold weather so near there is little doing in building and the local market is very quiet.

A Quiet Season Expected in New Brunswick

St. John, N.B., Nov. 4.—Prominent lumber operators report that the outlook in this province for the next year is not particularly encouraging, and unless a change for the better presents itself, it is not expected that the season of 1912 will be recorded as an active one. All lumbermen agree that the cut this year is to be greatly reduced, and various reasons are given for the decrease. The strike in England some weeks ago practically paralyzed business for a time. Stocks of Canadian spruce are excessive in England, it is reported, but the consumption for the last month was disappointing.

Operations on a small scale have been begun in New Brunswick woods, and several lumbermen have sent crews into the woods, but the work will be limited as compared with other years. Since they have quite a supply of logs already piled it is expected that the mills of Stetson, Cutler & Company will be about the last to cease operations this year. Early in December will probably see the close of the mills owned by Murray and Gregory, Charles Miller, John E. Moore & Company, Hilyard Bros., Messrs. Warner and others.

Backward Trade in Eastern Quebec

While the lumber business in many parts of Canada has been gradually improving during the past year, there are in some eastern parts of the Dominion, districts which have suffered seriously from a combination of untoward conditions and have come through the season with an actual loss. A report upon conditions in Gaspe, Que., from the Cascapedia Manufacturing & Trading Company, Chaleurs, Que., gives a gloomy view of the situation, but there is good reason to hope that the curtailment of operations this winter will place the industry again on a prosperous basis. The report is as follows:—

Editor Canada Lumberman:—The past year's operations in the lumber line down this way have been far from a success or profitable. The logging last winter was very expensive, owing to the extremely deep snow. Then, to follow that, the drives were very expensive, owing to the extremely low water all the spring and early summer, so that it is safe to say the logs gotten out in this part of the country for this year's cutting, cost on an average of $1.50 to $2.00 per M. higher than the normal. Then all season through, we have been selling our stock at very low prices, so that the lumber business in most instances in this part of the country this year will show a positive loss. This has had the effect of very seriously curtailing the bush operations this fall and winter. In our own logging here on the Gaspe Peninsula, we think nearly fifty per cent. of the lumber concerns are doing absolutely nothing, not taking out a log.

The small shingle operators through here who usually run from five to seven shingle mills all winter, are doing nothing, as the shingle market is so dull that they cannot get any returns for their shingles.

The outlook for the coming season, we consider anything but promising, although the serious curtailment in the production may have some effect on the market.

In this part of the world what is needed for our lumbermen, farmers and fishermen is reciprocity with the United States, and had we succeeded in getting reciprocity measures through, it would have been a great boon and would have meant thousands of dollars in the increased value in the holdings of lumber, lath and shingles ready for the market, as well as the prospects of better business and increased prices for the coming year.

At the present time, it is practically impossible to put our cedar shingles, which form a large part of the production in this part of the world, into the United States market, owing to the high tariff and until this thing is corrected, we do not see any hope whatever for the shingle trade in this part of the world.

The manufacturers down this way are unable to reach the markets of Western Quebec, Ontario or the great Northwest, and we are practically dependent upon the United States market for fully sixty per cent. of the output of our mills, so you can easily understand what a serious thing it is for us not to be able to get into that market, except on the payment of the present duty.

Reduced Cut in Northern Maine

A report from Bangor, Maine, says:—Lumber operators in northern Maine, on Aroostook, Allagash and St. John waters, have generally decided upon a great curtailment in their log harvests this winter, while some will not cut any logs at all. A Bangor man, who is agent for one of the largest land owners in Arostook county, recently returned from that region and reports that in most localities the reduction of cut will be 60 to 70 per cent., the total output being now figured at 28,000,000 to 35,000,000 feet, as compared with 80,000,000 to 110,000,000 normally. The St. John Lumber Company, which usually cuts in excess of 10,000,000 feet, will cut 15,000,000 feet this winter, while Stetson, Cutler & Co., will reduce their operations from the average amount of 25,000,000 to about 10,000,000 feet and smaller concerns will curtail proportionately.

There are several reasons for this great shrinkage of the Aroostook log cut. The lumber market has been very dull this year, the New York demand, especially, having been slack, and a great many millions of feet of logs have been "hung up" or stranded, on the way to boom, so that there will be a lot of old stock available for next year's sawing. The falling off in the operations of concerns sawing Maine logs in New Brunswick mills is chiefly accounted for by the repeal of the Pike law, under which, for forty years, the product of such logs was admitted free into American markets. The lumber now has to pay a duty of $1.25 per M.

Canadian Lumber in the West Indies

S. P. Musson Son & Company, Barbadoes, report under date of October 28 as follows:—Lumberstuffs—White Pine—There have no arrivals of this description of lumber during the fortnight, but a small cargo has been sold to arrive at $31 for merchantable, and $23 for second quality, and we value first arrivals in the vicinity of these prices. Spruce—We note a sale of 56 m. ft., thin and narrow boards, ex Trn. Schr. "Adriatic" at $18.13 and $14.13, and 10 m. ft. hemlock by same vessel at $15.13 round. We ourselves have sold a cargo of spruce to arrive at $25 for merchantable, and $20 for second quality. P. pine—No arrivals during the fortnight, the last two steamer cargoes having filled present requirements. Shingles—The Trn. Schr. "Arkona" arrived from Gaspe on 25th inst. with 1,102,750 laying shingles, which had been sold to arrive sometime ago at the following prices: 751,750 Extra No. 1 at $2.10, and 151,000 No. 1 at $1.90, 100,000 Clear Whites $2.75, and 100,000 2nd Clears at $2.50. The Trn. Schr. "Annie E. Banks" arrived on the 27th from Hantsport to our address with 1,500,000 Extra No. 1 which we had sold at $2.05. Long Gaspe are in good demand.

Lumberman Drowned while Shooting

Mr. George Scott, prominent among Montreal Trade, Upset from Canvas Boat while in Pursuit of a Deer

The Late Geo. Scott, Montreal

Montreal has lost one of its most prominent lumbermen by the death of Mr. George Scott, president of the Gambo Lumber Company, of Gambo, Newfoundland, secretary-treasurer of the Argenteuil Lumber Company, Montreal, and vice-president of the Montreal Lumber Association. He was drowned on Tuesday, October 31st, while a deer shooting party at Long Lake, 2 miles north of Montfort, in the Laurentian Mountains. The party included Mr. J. E. Seale, vice-president of the Argenteuil Company; Mr. A. S. Cleland, Mr. Christie, Mr. Herdman (his brother-in-law), and Mr. Dewar.

From statements made by members of the party, it seems that Mr. Scott was heard to fire at a deer across the lake, and was immediately seen to put out in a folding canvas boat, disappearing towards the other shore. This was at 8.45 in the morning, and as Mr. Scott did not reappear, his friends organized a party and searched the lake in a boat. They found the upturned boat, with his cap underneath. The next morning a further search was made, and the body was found in about 30 feet of water.

There were no actual witnesses of the tragedy, but Mr. Scott's friends believe that while rowing he caught a crab, and fell back against the side of the boat, which overturned. Mr. Scott was able to swim.

The body was brought to Montreal, where the funeral took place. A large number of members of the Montreal Lumber Association and representatives of the trade attended.

Mr. Scott was born at Cambria, Que., and was 38 years of age. During the early part of his business career he was book-keeper in the Montreal Board of Trade. He then became connected with the Morin Mills Company, which he represented in Montreal. The interests of the mill were merged with those of the Laurentian Lumber Company, and later Mr. Pergley, M.P., Mr. Scott, Mr. Seale, and others bought the Morin mill and limits, and formed the Argenteuil Lumber Company, of which he had the management.

For many years he was a member of the St. James Methodist Church; also a past grand master of the Montreal district of the Canadian Order of Oddfellows, and a very prominent member of the Mount Royal Lodge of that order.

Reduced Stocks of Canadian Woods at London

Messrs. Churchill & Sim, London, in their wood circular dated October 4, report the following stocks of timber from the St. Lawrence, as compared with those of a year ago: Pine deals, 1911, 271,000 pieces; 1910, 431,000 pieces; spruce deals, 1911, 625,000 pieces; 1910, 625,000 pieces; birch planks, 1911, 236,000 pieces; 1910, 243,000 pieces. From New Brunswick the figures are as follows: Pine deals, 1911, 45,000 pieces; 1910, 51,000 pieces; spruce deals, 1911, 384,000 pieces; 1910, 468,000 pieces; birch planks, 1911, 221,000 pieces; 1910, 282,000 pieces.

Regarding trade conditions they report as follows: "There is no change to report in the pine deal market during September, the importation has continued on a small scale, the stock has scarcely altered, and prices remain quite as high as in the foregoing months of the year. There has been a larger importation of spruce deals from the St. Lawrence during the month than for some time past, with next to nothing, however, from the lower ports. The deliveries have been rather freer than in recent years, but there has been no animation in market rates, which are something below those of the last month or two. Oak, elm and birch timber and birch planks have been much neglected during September. The eleven logs of ash timber in the docks at the beginning of the month remain there at the end of it. Yellow pine timber has perhaps been a little more enquired for log by log."

The Bronson Lumber and Saw Mills Company, Limited, Ottawa, have taken out a permit for the erection of a pulp mill to cost $30,000 at the Chaudiere. Work has already been commenced.

Canadian Wood Goods at Glasgow

Messrs. Cant & Kemp, Glasgow, in their timber market report dated October 3, say:—The stock of Quebec yellow pine waney board wood is moderate with a fair demand. Prices are firm, parcels arriving going largely into consumption. The stock of Quebec square yellow pine is light and quotations are firm. The stock of Quebec red pine is nil, with hardly any enquiry. The stock of Quebec oak is moderate, with a fair demand for first class lots. Prices are very firm. The stock of Quebec elm is light, with a fair enquiry, which seems likely to continue for some time. Prices are firm.

The stock of ash is very light and enquiry is chiefly for first class parcels of Canadian timber. Quotations are firm, with an upward tendency. The stock of birch in both logs and planks is not heavy, and scarcely equal to the demand, which continues good. First class parcels command a good price, and quotations are as follows:—Logs, 1s. 9d. to 2s. 6d.; planks and boards, 1s. 3d. to 1s. 9d., all per cubic foot, according to quality and specification.

Regarding Quebec yellow pine deals, etc., they report as follows: The stock is very much lighter than at this time last yer. The demand has been moderate and largely for the better grades. Wide deals and sidings have met with a fair response and command good prices. Sidings of wide average are frequently enquired for. Quotations are as follows:—Firsts—Broads, 4s. 6d. to 5s.; regulars, 4s. 3d. to 4s. 6d.; undersized, 3s. 2d. to 3s. 4d. Seconds—Broads and regulars, 3s. to 3s. 6d.; undersized, 2s. 1d. to 2s. 6d. Thirds—Broads and regulars, 2s. to 2s. 4d.; undersized, 1s. 8d. to 1s. 11d. Fourths—Broads and regulars, 1s. 5d. to 1s. 10d.; undersized, 1s. 4d. to 1s. 7d. Good sidings—3s. 9d. to 4s. 9d.—all per cubic foot, according to specification.

Stocks of Quebec red pine deals are light, with a very moderate enquiry, and prices are firm. Stocks of Quebec spruce deals are moderate, with a limited enquiry, and prices are steady. Quotations are: 9 inch and up, 1s. 1d. to 1s. 3d.; and 6 to 8 inches, 11½d. to 12½d.—all per cubic foot.

Timber Trade in the United Kingdom

Normal Conditions Returning—Railway Traffic Catching Up to Arrears — Liverpool Trade Improving

Liverpool, Nov. 2.—At London and at the larger ports in the United Kingdom, the timber trade again wears its normal aspect. Arrears of business caused by the dislocation of railway traffic through the transport workers' strikes, have had to be worked off and this has kept office and yard staffs busily employed. At London and at other ports, accordingly, fairly large quantities of timber have been delivered for consumption and a more hopeful tone pervades the markets. The demand from the building trade keeps quiet, but joiners who do a general trade are busy and are taking supplies of timber steadily. Yellow pine of all but the poorest quality, has been in good demand by this branch of the trade. Packing case makers are busy and are using whitewood freely. Any lengths and breadths of this wood, of ⅞-in., ⅝-in., or less in thickness, can be used up readily and a large consumption of the wood is now in progress. Floorings have been in more demand and a very fair total quantity has been sold. Stocks are now in a small compass and prices are tending upwards.

At Liverpool, business has improved slightly. Spruce has been in more request and is now very firm, little of the wood being offered. In pitch pine, sawn wood is in more demand, but values are unchanged. Lumber, also, has been more called for, and recent prices are firmly held. The outlook at Liverpool has been much brighter.

At Manchester, timber is moving more freely, and prices are hardening. The talk is of raising the price of spruce, 5s. per standard. Deals 11-in. x 3-in. have been in more inquiry and red-wood has sold more freely. The outlook has much improved, and a good winter trade is being counted upon.

On the Tyne, joiners' wood is in somewhat larger consumption. Shipbuilders are still busy and are making a steady demand for spruce deals and for red-wood. The coal mining industry is in active progress and a large consumption of pitchwood is going on.

At West Hartlepool, a very fair demand for sawn wood exists. Saw mills are well employed and joinery works have more orders in hand. At this port also, a large demand for pitwood is in progress. As showing the extent of the trade in this wood, it may be mentioned that in the third week of October no fewer than fifteen cargoes of mining timber came to hand.

At Glasgow, a very fair business is being done in spruce; in sawn pitchpine, and in wood for shipbuilders' uses. Wagon builders continue to take oak and ash, and a steady trade of fair extent is being done in these woods.

In London and in the provinces there is more inquiry for wood blocks for street paving. In some towns wood paving projects are now under consideration by town councils and orders for blocks will shortly be put in hand. At Southampton, instructions have lately been given to the borough to obtain some 10,000 hardwood blocks for paving. At Southport, Lord street, a magnificant boulevard thoroughfare, is to be re-paved with wood blocks but a controversy has arisen as to whether the blocks shall be of deal or of one of the harder Australian woods. When this point has been settled the re-paving of the thoroughfare will be carried out.

Enforcing the Shorter Credits

The long credit question continues to occupy the attention of timber importers and merchants at London. In accordance with the decision at the special meeting of members of the London trades, on July 12 last, and of the recommendations of the sub-committee who had been inquiring into the matter, the trade as a whole has been notified of the decisions come to at the meeting in question, with a view to putting an end to the abuse of the credit system, which has become so common in the trade. A further meeting of the importers' section of the Timber Trade Federation has been held and the subject has been brought, as it were, quite up-to-date. Mr. George H. Lindsey Renton, who presided, explained what had been done to give effect to the resolutions passed at the July meeting. A number of firms in the country had, he said, endorsed the resolution passed at that meeting that the terms of credit should be uniformly: "Cash less 2½ per cent. on or before the end of month following delivery," or, "acceptance at four months, in lieu of six, as at present prevailing." The prospects of securing a general concurrence in the adoption of these resolutions by the trade, was considered. It was felt to be highly desirable that the full concurrence of the trade should be obtained, as, unless it were so obtained, the attempt which had been made to improve the practice with regard to the payment of bills, might be frustrated or but partially successful. It was decided that a meeting of the sub-committee should be convened, at which the position of the question could be reviewed and such further action be determined on as might promise to be most effectual in bringing about the change which the sub-committee and the Federation had in view.

It may be mentioned that the resolutions quoted above, which were adopted by the trade in London at the meeting on July 12, represent a very moderate request to be made of members of the trade at large. The rule: "Cash, less 2½ per cent. on or before end of month following delivery," is really the standing rule for payment, in common mercantile use. In asking the trade at large to observe it, the Federation will not be asking for anything out of the ordinary, or for any special concession, but simply for a fresh recognition of that which has long existed and been observed in most trades. The proposal regarding the payment of bills errs if at all, on the side of liberty. It asks for acceptance to be at four months instead of six. An old and well-established mercantile practice recognizes three months as a sufficient time to allow for meeting bills. Four months ought therefore to satisfy, and it has been shown that a large part of the trade thinks so. The sub-committee will no doubt be able to obtain the concurrence of most, if not all, of those who have not yet given their assent, formally to the proposed changes. One can hardly imagine that there will be any real withholding of assent, seeing that each will enjoy alike the advantage which will be gained.

Protest Against Increased Rates

The Timber Trade Federation of London has decided to lodge a protest against the action of the Port of London Authority, in increasing the dues, rates and charges on vessels, lighters and merchandise, by 7½ per cent: The Federation protests, in view of the hardship on the timber trade, owing, amongst other things, to the fact that rent is charged from the date of breaking bulk, in the case of timber cargoes and not from the date of the landing return. The Federation will be able to make out a good case for timber, and, it is to be hoped, will succeed in their plea on behalf of the trade.

Mr. C. E. Paynter, of the old establisher Liverpool firm of Alfred Dobell & Co., timber brokers, has been chosen as a representative of the timber trade of the port, on the Mersey Docks and Harbor Board. It is many years since the trade had a representative on the Board. Through the past seven years it has been felt that the trade ought again to have representation on the Board, in view of changes which have taken place in accommodating the trade at Liverpool. The return of Mr. Paynter as a member of the Board is consequently a matter of much satisfaction to the trade.

Railway Wagon Building

Satisfaction was caused in the Birmingham district and in the west of England in the last week of October by the knowledge that the Great Western Railway Company had given out orders for 3,000 new wagons; about two-thirds of the number to be built at Birmingham, the other third in the West. Iron under-frames are specified for. The upper parts of the wagons will be of wood, so that a considerable demand for side and bottom planks will reach timber merchants in respect of the building of the wagons in question.

The Late Mr. W. L. T. Foy

The timber trade of London has lost a prominent and greatly respected member by the death of Mr. W. L. T. Foy, senior partner of the firm of Foy, Morgan & Co. The deceased gentleman was seventy-six years of age, and may be said to have died in full harness as he passed away almost in the whirl of activities of a business of great magnitude. For many years he had conducted the fortnightly sales for his firm, and on Wednesday, October 18, he conducted the day's sales at the Cannon street Hotel, London, as usual, and with his accustomed energy and precision. After leaving the hotel he went to his office and attended to the day's business. Shortly after five o'clock Mr. Foy left his office for Southend. On the following day he was walking up a hill at Westcliffe, when a failure of the heart occurred. He was carried into the house of a friend but expired shortly after.

Mr. Foy was educated at Chatham House School, Ramsgate, and in 1858 he entered the office of Henry Clarke & Co. Here he learned the timber trade and was for a time in charge of the noted Maimax stock. A few years later he joined Mr. Johnson as a timber broker. This partnership lasted three years, at the end of which time Mr. Foy began business on his own account. In 1876 he joined Mr. Charles J. Morgan, the firm taking the style of Foy, Morgan & Co. Mr. Foy did the selling for his firm at the auction sales, first at the Baltic sale-rooms and afterwards at the Cannon Street Hotel. He was a director of the Surrey Commercial Docks from 1887 until 1908, when the docks were taken over by the new Port of London Authority, and was chairman of the Docks Committee in 1896, and vice chairman in 1895 and 1908. When the Surrey Docks were taken over by the Port of London Authority, Mr. Foy's co-directors presented him with a silver cup in recognition of his services as deputy chairman, with the chairman, Mr. Borills, in carrying through the negotiations for the transfer of the docks to the new Authority. Mr. Foy took a very warm interest in the Timber Trade Benevolent Society and was the first president of the society, from 1897 to 1901, and again in 1905-6. On attaining his 50th year, Mr. Foy was presented by the trade with a valuable service of plate, as a mark of respect. In civic as in business affairs he attained much distinction. He was deputy lieutenant of the City of London, and a Juctice of the Peace for the County of Middlesex. He was a widower, and has left four sons and three daughters. The interment took place at Old Highgate Cemetery, London, on Monday, October 23, and was largely and influentially attended.

Waney Pine Moving Freely at Manchester

Messrs. Farnworth & Jardine, Liverpool, England, in their wood circular of October 2 report as follows:—Canadian woods—Pine timber—Of waney first class there has been a considerable import to Manchester, the greater portion having gone direct into consumption; stocks are moderate, values rule high and unchanged. Second Class—There are no transactions to report; stocks are moderate and values firm. Square pine has not been imported; demand continues very limited and stock is light. Red pine has not been imported; there is very little enquiry for this wood and small stock on hand is quite sufficient for any probable requirements. Oak—The import of 6,000 cubic feet has been to Manchester, the bulk goes into stock; there have been no imports to Liverpool during the past month, but considerable deliveries have been made from the stocks which were on the quay at the end of August; there is no change in value to report. Elm has not been imported during the past month; there has been a fair demand, and stock is small; values remain high. Pine deals have been imported moderately; there has been a fair demand, stocks are ample and values unchanged. Red pine deals have been imported moderately but sufficient quantity for the requirements of the trade; stocks are not excessive. Siberian pine has not been imported during the past month; some progress has been made with the shipment which arrived in August.

New Brunswick and Nova Scotia spruce and pine deals—The import to the Mersey during the past month (including Manchester) amounted to 7,540 stds. compared with 20,570 stds. during the corresponding month last year, largely discharged at Manchester; deliveries have been satisfactory, amounting to 10,830 stds. against 10,590 stds. last year, but c.i.f. value have so far not responded to the strong advance in ocean freights shippers are now paying. Pine deals—There is little change in the position to report; values are practically unchanged.

Birch—Logs—The import during the past month, both to Liverpool and Manchester, has been light. Fair progress has been made with deliveries; stocks, although not excessive, are quite sufficient for the present, and values are unchanged. Planks arrived to about an average extent, demand limited, values are steady.

Personal News of the Trade

Mr. F. N. McCrea, M.P., president of the Sherbrooke Lumber Company, has just returned from a visit to the West.

Carl Riordon, managing director of the Riordon Paper Company, Montreal, was in Toronto and Merritton recently on business.

Geo. I. McClure, Detroit, Mich., has recently opened a large storage yard in West Detroit, at the corner of Clark and Plummer, on the main line of Michigan Central. Four tracks, each 350 feet or more in length, enter the yard, and there is storage comfortably for about 300 cars. In the near future Mr. McClure intends to put up sheds, for the storage of flooring, ceilings and kiln dried stock.

Mr. R. Harcourt Smith, of W. & J. Sharples, Quebec, made a business trip in Ontario recently, and while in Toronto favored the Canada Lumberman with a visit. Mr. Smith reports that trade with Great Britain is improving, but that it will be some time before the effects of the recent labor troubles in England will be overcome. From reports which the company have secured they believe that the output of waney timber in Canada for export to the Old Country will be increased this winter.

The Export Lumber & Shingle Company, Limited, Vancouver, B.C., are moving their offices to those of Woods & Spicer, Limited, Vancouver. Mr. H. H. Spicer, for so many years associated with the lumber business of British Columbia, is resigning his position as manager of the Export Lumber & Shingle Company, and is retiring from the lumber business in order to give his whole attention to his personal affairs. The active management of the company is being taken over by Mr. J. G. Woods, who has been its president for several years. Mr. Spicer's retirement from the lumber business will be much regretted by all who have been fortunate enough to have business dealings with him.

Fisher and Bryant, consulting foresters, 141 Milk street, Boston, Mass., have taken into their firm Mr. Frederick Erskine Olmstead, who had been connected with the United States Forest Service since 1900. After a training including two years practical experience under the forest officers of Germany and India, he began government work on timberland examinations and working plans in southern and eastern United States. He was then assigned by Mr. Pinchot to direct the field investigations which led to the creation of many of the United States National Forests, and for the past four years he was in administrative charge of the National Forests in the State of California. The firm's business will hereafter be conducted at the above address under the name of Fisher, Bryant & Olmstead.

At the annual meeting of the stockholders of the Fassett Lumber Company, Limited, held at their office at Fassett, Quebec, on October 18th, at the close of the most successful year in the history of the company, the following board of directors was appointed, to the unanimous satisfaction of the stockholders, of whom a large number were present:—Messrs. Chas. Adsit and F. P. Merrill, of Hornell, N.Y.; J. Sloat Fassett and Harry S. Thayer, of Elmira, N.Y.; A. E. Edgcomb, of Knoxville, Pa.; J. Newton Peck, of Philadelphia, Pa.; W. J. Humphrey, of Warsaw, N.Y., and J. R. Collins, of Fassett, Que. Mr. Collins was retained as manager of the company, the officers also remaining unchanged as follows:—J. Sloat Fassett, president; A. E. Edgcomb, vice-president; Harry S. Thayer, secretary-treasurer, and J. R. Collins, manager.

Walter L. De Witt, for several years associated with the sales department of the Estabrook-Skeele Lumber Company, Fisher building, Chicago, has accepted the position of buyer and general representative in the United States for the firm of Seaman, Kent & Co., of Meaford, Ont. This company handles large quantities of northern and southern hardwoods, and Mr. De Witt will make its purchases of lumber produced in the United States. He has secured offices in the Steger building, at Jackson boulevard and Wabash avenue, and starts in this week ready for active work. Mr. De Witt is a northern lumberman, and has had many years of experience in the trade at Traverse City and in northern Michigan generally, and has also had considerable to do with southern products, so that he enters his new field well equipped for the business.

The shipments of timber, which rank second among Russia's exporting commodities, are increasing yearly. The quantity of timber exported in 1910 was 6,696,338 tons, valued at $70,879,450, compared with 6,872,161 tons, worth $65,066,645, for the preceding year. Of this total, $43,239,915 worth consisted of deals, battens, and boards. The principal recipients were Great Britain, $29,914,805; Germany, $19,934,620; Netherlands, $5,297,290; France, $2,869,065; and Belgium, $2,505,990.

Lumbermen Complain of Evasion of Duty

Reference was made recently in The Canada Lumberman to the improper entry into Canada of a class of finished lumber which is permitted to escape the payment of duty. A delegation of the Canadian Lumbermen's Association has now laid the matter before the Customs Board at Ottawa. While the point is largely technical, considerable interest is involved in its interpretation. Under the Customs Act rough lumber and edged is dutiable. The allegation is that United States manufacturers joint and edge their product, afterwards adopting a roughening process. The lumber is then shipped to Canada and classified as rough, where really it is claimed to be dutiable as a finished product. It appears that there have been extensive importations of this class of material, and the Customs Board is asked to declare it subject to duty. The matter was not decided, but taken into consideration.

Among those present, representing the lumber industry, were the following:—P. D. Roe., Emerson Lumber Co., Port Moody, B. C.; E. S. Home, East Kootenay Lumber Co., Jaffray, B. C.; A. C. Flumerfelt, Hastings Shingle Manufacturing Co., Vancouver, B. C.; Gordon Edwards, W. C. Edwards & Co., Ottawa; W. J. MacBeth, Parry Sound Lumber Co., Toronto; Mr. Ross, representing J. R. Booth, and Mr. Egan, representing the Hawkesbury Lumber Co.

The recommendation of the lumber manufacturers was summed up in the following clause which it was proposed should be placed in the Customs Tariff to take the place of clause 504.

Joists, scantling and similar dimension lumber planed or dressed on one or both sides and jointed on one or more edges by saw or plane, and being suitable for use in buildings without further manufacture (sawing to length not considered a further process of manufacture)—25 per cent. ad valorem.

Duty on Lumber will be Enforced

Ottawa, Nov. 10.—As a result of the representations made by lumbermen regarding the evasion of duty upon finished lumber entering Canada from the United States, Hon. J. L. Reid, Minister of Customs, issued the following statement to-day: "A deputation of lumbermen has been in the city for the last few days, laying before the Ministers of Customs the claim that American lumber is being shipped into Canada free of duty when it should be liable to duty if entered upon the proper item of tariff. Their claim was that rough lumber planed on one side only was free of duty, while in the cases mentioned the lumber so imported had not only been planed on one side, but tampered with, and further manufactured than is provided for under the item of tariff free. The Minister referred the claims of the deputation to the Board of Customs and on the evidence submitted they advised the department to notify all collectors of customs to more carefully scrutinize and examine importations, and where the the lumber being imported had been tampered with, and did not fall under the grade of that on the free list, that the requisite duty should be collected."

Governments Helping Yellow Pine

If the lumberment of Canada who feel so keenly the effect of competition of yellow pine, would co-operate to fight it in their own markets they could probably bring about a great improvement in the situation. Educating the consumer to the superiority of Canadian lumber is the most promising method. Educating the retailer to push Canadian lumber is almost as promising, and last, but by no means unimportant, comes educating Canadian governments to a reasonable understanding of their duty both in the use of Canadian products and in the protection of Canadian lumber against foreign lumber, manufactured by cheap labor, under conditions which can not and ought not to be reproduced in Canada. The Canada Lumberman has published many articles on this subject. Regarding one which appeared in the issue of November 1st, Mr. Charles McGibbon of Penetanguishene, writes in part as follows:—"I have read your article in the Canada Lumberman re southern pine, and I must say I am much pleased and consider it a very able production and I hope to see the daily papers copy it, as it interests every one, especially any one contemplating the erection of a home. The railways are great sinners, as they have been using large quantities of this wood, notwithstanding the fact that a very large portion of their revenue comes from the lumbermen of Canada.

"The local government is also a strong rival along this line, many of the timbers and lumber used on the T. & N. O. are out of southern pine. This seems extremely foolish, as this road passes through timber equally as good as any timber on this continent, either for bridge building or for the erection of stations."

The Lake Megantic Pulp Company will build a dam on the Chaudiere river at Lake Megantic, Que., to develop 1,500 horse power.

A Great Saskatchewan Spruce Saw-Mill

The New Plant of the Big River Lumber Company at Big River is the Largest Spruce Mill in Canada. The Men, The Mill, The Machinery

It is only during the past few years that lumbermen have begun to realize the importance of the great tracts of spruce timber which lie to the north of the prairie provinces. The idea of building plants for the manufacture of lumber in Saskatchewan and Alberta is, comparatively speaking, a new one and the possibilities of the proposition have only recently commenced to be brought home to those who have the necessary capital to invest in saw-milling projects.

A striking illustration of the possibilities of the country is found in the operations of the Big River Lumber Company, of Big River, Saskatchewan. This concern has spent or is spending three millions of dollars in buying timber limits and erecting a saw-mill plant, offices, dwellings and other buildings. The circumstance is an indication of what the future may bring forth.

The project recently completed by the Big River Lumber Company is a huge one, conceived on generous lines and carried out on a big scale. Here in the heart of the wilderness, the company has erected and is now operating the largest spruce mill in Canada. The community is a new one the virgin forest was cleared from the site of the mill only a few months ago. During that period a little town has sprung up, the whizz of many saws and the roar of ponderous machinery has taken the place of the primitive stillness and the choppers are already making inroads upon the clean, thick-growing forests of spruce. The mill is farther north than any other stationary plant in Canada and is located in a country that is entirely unsettled and little developed.

The Saw-mill

The equipment provided for the sawing of the lumber is the most complete obtainable and includes all that is newest and best in the way of improved gear and machinery. Nothing has been left undone to provide the maximum of convenience and rapidity in all portions of the plant and its contents.

The village of Big River, where the plant is located is situated eighty-eight miles west of Prince Albert on a branch of the Canadian Northern railway. Work was started on the mill in July, 1910, and was completed in September, 1911. The material for the mill and the other buildings was sawn on the spot by a portable mill which was taken in for the purpose.

The project is one of big results and big figures. The possible output per day is from five hundred to six hundred thousand feet running day and night. Five hundred and fifty men men are employed at the saw-mill and 2,500 men in the bush. The winter's cut of logs will total to 90,000,000 feet. Logging operations were started last year in the vicinity of the mill. This year the logging operations will extend back a distance of twelve miles.

The plant includes a planing mill of an up-to-date type, and a box manufacturing plant. The main building of the saw-mill is 84 ft. by 272 ft. with an addition on one side 32 by 145 ft. for the lath mill and an addition on the other side 36 by 163 ft. for a slab re-saw and other machinery. The power house is a solid brick building 80 ft. by 152 ft. with a metal roof. The fuel house is 24 ft. by 48 ft. and of the same material.

The Machinery

The logs are manufactured into rough lumber by three single-cut band saws, a vertical and a horizontal re-saw. There are two lath machines which have a capacity of 100 thousand lath every ten hours. The box-making equipment consists of a small re-saw, an edger and trimmer.

The principal machinery on the saw floor consists of three band mills with 8-foot wheels for 14-inch saws; one horizontal band re-saw for slabs, having 8-foot wheels for 12-inch saws; re-saw for slabs having 8-foot wheels for 12-inch saws; one vertical band re-saw with 8-foot wheels for 12-inch saws. These band-mills are of the Filer & Stowell manufacture.

All the band mills are equipped with steam operating guides and steam balancing cylinders for convenience in changing saws.

Col. A. A. Davidson, President Big River Lumber Co., Limited

H. W. Racey, General Manager Big River Lumber Company, Limited

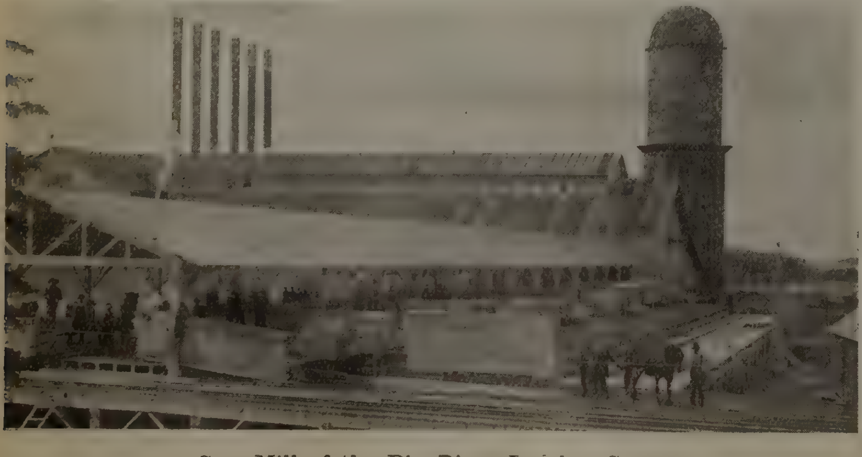
The vertical band re-saw is equipped with automatic steam set works. The three carriages are provided with steam setting devices and are handled by 12-inch shot gun steam feeds.

The equipment includes four gang edgers, two of which are 72 inches wide, and two 54 inches wide respectively, all carrying saws 26 inches in diameter. Each of the two trimmers is 26 feet long.

The power plant for the Big River Lumber Company's mill is in a fireproof building, 84 feet 6 inches by 155 feet. The engine furnishing power for the saw-mill is a Filer & Stowell "1900" heavy duty rolling mill type, Corliss, capable of developing 2,000 I.H.P., having 38 x 60-inch cylinder, with wheel 24 feet in diameter and 68-inch face, weighing 75,000 pounds. It is what is known as the built-up type wheel, with hubs, arms and sections of rim cast separately, and machined and bolted together. The crank shaft of the engine is 19 inches in diameter.

Besides this engine, the power plant includes two other Corliss engines of the same type and make. One has a 30 x 48-inch cylinder, and is coupled direct to an 800 kw. or 12,000 h.p. Crocker Wheeler alternating current generator, which furnishes the power for operating motors in the planing mill.

The third engine has 16 x 30-inch cylinder, and is coupled di-



Saw Mill of the Big River Lumber Company

Another View of the Mill

rect to a 200 kw. alternator, which furnishes power for the lights for the saw-mill, planing-mill, and other buildings.

Steam is provided by twelve 72-in. by 18 ft. horizontal tubular boilers built for 150 lbs. of steam. These boilers were furnished by the Muskegon Boiler Works, of Muskegon, Michigan. The boilers are arranged in six batteries, two boilers in a battery, built for overhead suspension, Dutch oven setting with Ashley steel casings, for independent combustion chambers. A steam drum extends over each three batteries and is connected to the boilers by means of pipe bends, and a gate valve located on each bend so that each boiler may be fired or shut down independent of the others. The two steam drums are connected together by means of a 12-in. semicircular pipe bend. Each battery is provided with a center draught breeching, and stack 52 in. in diameter by 100 ft. high. Each stack is provided with a double spark arrester.

A steel sawdust deck 14 ft. long extends across the entire length of the boilers in front of same. The boilers are fed automatically by means of steel conveyor systems, the entire installation is of steel throughout and makes a much neater and much more efficient setting than the old style brick setting. This installation is one of the best yet used, and is a credit to the manufacturers.

In connection with the plant there was installed one of the finest water space burners obtainable. This structure is 34 ft. inside diameter by 37 ft. outside diameter, by 72 ft. high of water space, same being surmounted by a stack 50 ft. high, which in turn is surmounted by a double spark arrester 21 ft. high, making a total height over all of the steel, 143 ft. The burner was also furnished by the Muskegon Iron Works.

The entire planing mill equipment of the company consists of Berlin high speed machines, supplied by the Berlin Machine Works, Limited, Hamilton, Canada, including one No. 16 sizer and matcher, one No. 186, double surfacer, seven No. 90 fast feed planers and matchers, two band re-saws and the additional requirements of outside moulders, trim saws, edgers and self feed rip saws.

The sizer, surfacer, matchers, moulders, trim saws and band re-saws are all connected direct to electric motors through flexible couplings.

The logs are brought to the saws by means of a Clyde log loader built and supplied by the Clyde Iron Works, of Duluth, Minnesota. The electrical equipment was built and installed by the Canadian Crocker Wheeler Company, of St. Catharines. Ontario.

The Limits

The limits of the company cover an immense tract of 500 square miles. The land is thickly timbered with a growth consisting of, approximately, 90 per cent. spruce and 10 per cent. jack pine. The average size of the logs run 20 pieces to a thousand feet.

When the logging operations extend further back into the woods the logs will be driven down Otter Creek and Big River.

River Co
SASK

Loading Logs on Cars on C. N. R. Main Line

The driving is good for the entire season of open water. The river will be improved with dams and by other means to facilitate driving.

Another feature in connection with the operations of the company is a fully equipped yard for the manufacture of bricks. The bricks used in the building of the power house and in other portions of the plant were manufactured at this yard. The plant has a capacity of 4,000 bricks per day.

The railway accommodation consists of a spur of the Canadian Northern, which has a terminal at Big River. The lumber will all be shipped by rail and will be marketed at the prairie cities.

The Company's Town

The company's mill-site and town-site is situated on the head of Crooked Lake just where Big River empties into the lake. The land raises gradually from Crooked Lake back to Ladder Lake, about one mile distant, and the town is built on this slope, the resultant natural drainage coupled with the fact that the ridge is covered with natural springs reduces the sanitary arrangements (which are vigorously and efficiently looked after by the company's doctor, a graduate of McGill University), to a minimum; thus making the place, for a sawmill town, unusually healthy and picturesque. The houses are all lighted by electricity supplied by the company's plant. Telephones are being installed as well as waterworks and sewer systems.

A hospital, shown in one of the illustrations herewith, has been erected, is thoroughly fitted up, has fourteen beds and is superintended by a trained nurse.

The company has taken every measure possible to provide comfort, health and convenience for their employees, and the little town which has sprung up in the midst of the forest might truthfully be described as a model one.

The Men at the Head

The Big River Lumber Company was organized in 1909. The officers of the company are as follows: Col. A. D. Davidson, of Ottawa, president; A. M. Nanton, of Winnipeg, vice-president; R. J. Mackenzie, of Winnipeg, John H. Munson, K.C., of Winnipeg, and William Cowan, of Prince Albert, directors.

Planing Mill, Hospital, Tenement Houses

The executive staff consists of H. W. Racey, general manager; Oscar Sharpe, sales manager; George Luckhurst, secretary, and T. R. S. Fenton, accountant. William Graham is mechanical superintendent of the plant. Mr. Graham made the designs according to which the mill was built and superintended the work of construction.

Col. Davidson is chief of the Canadian Northern industrial department, president of the firm of Davidson & McRae and of the Canadian Western Lumber Company, Limited, of Fraser Mills, B. C. Mr. McKenzie is superintendent of construction of the Canadian Northern Railway and one of the best known capitalists of the West. William Cowan is senior partner of the firm of Cowan & Co., lumber manufacturers, of Prince Albert, and Mr. Nanton is a member of the firm of Osler, Hammond & Nanton, Winnipeg.

Mr. Racey, the general manager of the company, has had a wide experience in the lumber business and has occupied a number of positions of much executive importance. He is well-known along the St. Lawrence and its tributaries as a lumberman of ability. He entered the employ of Price Bros., of Quebec, a number of years ago. He subsequently occupied the position of manager with Henry Atkinson, a prominent lumberman of St. Romauld, P.Q., for a period of four years. He again entered the employ of Price Bros., in the capacity of manager of the Saguenay district. Later he was for two years inspector and five years general manager of the Monimee division for Price Bros. At the time he was handling the Saguenay district, Mr. Racey also looked after the management of a pulp company in which his firm were largely interested, and while managing the Monimee division, he attended to the executive affairs of the Basin Electric Light and Power Company, in which Price Bros. were also the controlling interest.

Mr. Racey, therefore, is thoroughly at home in handling the affairs of the Big River Lumber Company and is well fitted both by nature and experience to fill this important position.

Mr. Sharpe, the sales manager, is well known to the lumber trade of the central provinces, having filled a similar position with Cowan & Company, of Prince Albert.

Mr. Wm. Henderson, one of the missionaries of the Shantymen's Christian Association, who devotes his time to missionary work among the lumber camps of Northern Ontario, reports that his work is meeting with encouraging success. They have now six men in prospect to assist in the work among the camps, during the coming winter. Mr. Henderson and one of his assistants have been visiting a number of the camps during the last few months and have met with considerable success. A drawback in previous years has been the lack of a French-speaking missionary for the work. The association is now in touch with one who they believe will be able to fill this need. Financial assistance has been received from many quarters, but little from the lumber industry.

The Retail Dealer and His Problems

Salesmanship—A Definite Practical Science

Salesmanship and the Art of Making a Sale

By B. R Vardaman

If we had time to thoroughly analyze this subject we would discover that our commerce is the real "power behind the throne." The law making bodies of the nations meet and spend long months in making laws, not primarily for the moral uplift but to better the relations between men as they exist in the field of trade, in commerce, and if we go behind the scenes we will discover that all back along the way great battles, sieges and conquests have been brought to pass largely through the commercial conditions.

I will go a step farther and say that the world's commerce is and has been one of the chief factors in our civilization. I know that we think of our civilization as a sort of spontaneous growth, springing up from somewhere, but our great civilization is largely an outgrowth of commercial conditions. As these conditions have made customs these customs have been crystallized into laws and step by step we have arrived at our present state of civilization.

As an illustration I will cite just one case. In an early day the great Hudson Bay Company went into the wilds of the Northwest Territory to establish a trading post, a little store, to trade with the trappers and hunters living in that great wilderness. The thought was not to civilize but to trade—to barter and exchange products with the trappers and hunters.

The post was established; a hunter came and built his cabin near in order to be close to a supply base; other hunters came and soon they brought their families. After that came the teacher to educate the children, the preacher to teach morality, and the lawyer to establish civil government, and, behold, here was a little plant of civilization in the wild, springing from the trading post.

Selling a Science

Now, I mention these things in passing with the hope that these broader thoughts of our business may lift some man to a higher plane of appreciation of his own business. I well realize that we are apt to think of our own particular business as a form of drudgery. We think of commerce as the great things outside our own particular line of business, the great industries, but our own phase of the great systems is merely business, a drudgery, going to the store or office day after day to perform a certain routine grind.

But now I want to talk with you about "making a sale," the real art and science, and making that sale. But I well realize that when I approach an audience of business men with this subject of "science" many are exceedingly apt to feel that such a subject is entirely out of place. We are accustomed to think of science as a thing emanating from the class room of the university and fit indeed only for consideration within the great educational institution.

However, I wish to state right now that the science that I am going to talk about is not that weird, mysterious and impractical thing that you might be led to think of. I am here to talk to you about the practical things in your business and I want to talk to you about the science of your business in the most common and practical words that I can command.

The definition of the science that I wish to discuss was given to the world by Herbert Spencer when he said "Science is organized knowledge." Now, don't go away from here and say that I said that "all organized knowledge is scientific." I am not saying such a thing; in fact, there is a whole lot of pretty thoroughly organized knowledge that is far from scientific. That is the very reason that so many business men are having such a hard time keeping their heads above water—they are going on the theory that the knowledge they possess is scientific.

Now, there is certainly nothing of greater moment to you as business men than a thorough knowledge of the organized knowledge of your business; in other words, "an understanding of the science of your business."

You know so well what science really means when viewed from this angle that I am not going to take time to analyze the term for you. If we were to go out here to a high school or college we would find some person in that institution who would be designated as the "professor of mathematics," which would mean to us that this man thoroughly understood the "organized knowledge" of the subject of mathematics. We know that he could easily demonstrate very complex problems so that they would be perfectly clear to us. He knows the science of mathematics.

Here is a young man who would like to become a doctor, but the laws of the land will compel him to spend long years in critical study of the subject before he is permitted to practise medicine. He must thoroughly understand the organized knowledge relating to the subject. He must know the human system, every tissue of it; he must closely study; he must know the different disease germs; he must know what remedies to apply to counteract their work. He must know the science or organized knowledge of the subject.

Then how about your own business—your business of making sales? Do you know the organized knowledge of your business as thoroughly as the professor must know his before he can even get a position, or as the doctor must know his business before he is given permission to practice?

I often think that the business man is about the only one left who does not make a close study of his business. In every profession the law comes in and takes a hand, compelling us first to prepare, first to learn the business. Even the farmer in this day and age is going to school to learn how to farm, but too often we find business men who say "What's the use? You must learn it." Of course you must learn it, and thousands are paying an awful price for learning simply because they have started at the wrong end to learn.

You would not think of letting your child attend school where you knew the teachers were "just picking up" the knowledge along that line. You would not go to a doctor who did not know the great science of his business. You should not try to do business without making a close study of the principles underlying.

Organized Knowledge in One's Business

Then how about the organized knowledge of your business? I met a real estate dealer and asked him how he happened to sell a certain house and lot. He said: "Well, I had the place listed for sale and a man came along who wanted that kind of a house and we simply made out the papers. It was simple."

Yes, it was simple; so simple that there was little to the transaction. But it was not the little superficial things that I wanted to know about. I wanted to know the great "how" of making people want that sort of a house and lot; I wanted to know how to reach out and take hold of people and develop a desire for that kind of property. I wanted to know how that I might reach out in the country and create a desire for the property that I might want to sell, and I would say to the real estate dealer that he does not know great science in his business if he can not tell me how to do some of these things. He can not write an advertisement that will appeal to people, that will sell real estate, if he does not know some of the great principles.

Follow such an investigation along various lines and you will be struck with the fact that few business men have gotten down to the real bottom of the things; we are apt to deal entirely with the little exterior things instead of getting right down to the principles, instead of grasping the great science of leading and persuading people.

Mentality in Sales Making

The thing we call "sale" is a mental science. I ask the merchant how many sales he has made to-day and he goes to the cash drawer and counts the money, or he turns to the sales book and counts the list and then he tells me the number. He says "Here are my sales." But he is mistaken. These tickets in the cash register drawer are only evidence of sales having been made; they are not the sale. The money is only evidence that some one has bought, that you have made a sale.

Every sale you make, I care not whether you are selling watches, real estate, diamonds, groceries or what not, you must lead the mind of the customer through a certain series of steps or stages. If you fail in this you will fail in making a sale.

There are a large number of these steps, but they are all founded upon four primary stages. First of all you get the attention of a customer; second, you must lead him from the stage of attention to the place where he becomes interested in your goods; third, you must arouse within him a desire, and, fourth, cause him to resolve to have the thing. Fail on one point and you have lost the sale.

Now, I say that the mind always passes through these same steps or stages. Sometimes the change from one to the other is as rapid as the thought of the human mind; other times the process is extended out over a period of weeks, months and even years, as is the case in the insurance business.

It is an interesting study to watch the development from one of these stages to the next, but the thing you as business men are interested in more than anything else is to see these things applied to actual business transactions—the things that come more closely to you.

I will repeat the statement that there are three principal factors entering into every sale, the salesman, the customer, the goods.

The Influence of Personality

No man is properly qualified to engage in business who has not first of all asked himself, honestly and candidly, "Am I fit for this thing?" Many and many a poor man has gone down in defeat in the great battle of business simply because he has not stopped and asked himself whether he was personally fit to handle the thing he was undertaking. I once heard an old white haired judge say to a class of graduates in an eastern law school: "Young men, as you go out in the world in practice in your chosen profession first of all learn how you look in the eyes of the people of your community," and I would repeat that same admonition to the man who would learn to become a great salesman or a successful business man—learn how you look to the people upon whom you must depend for your business.

In other words, learn what your personality is like; go down the street and watch yourself; see how you appeal to people. The world of business to-day wants strong, winning magnetic men; and I am going to take a little time to show you how the ordinary man can make himself more winning, more magnetic, more attractive. We sometimes get the idea that we have to rely upon old Dame Nature for all our personality. The fact is, we have had to develop most of it.

You can learn the things that appeal to people, the things that cause them to follow you and develop your own personality, just as easily as you can develop the muscle of your arm. You can make your individual personality felt in your business, on the street; you can make people feel the personality of your store, of your town. You can learn to appeal to people through the magnetism of your bearing, through your countenance, through your memory, the use of your eye, your voice, etc., and it should be the first great step in making a sale.

Knowledge of Human Nature

Again, I would say that the salesman must know something about human nature, about the things that cause people to act. He must be able to "size up" people, to read the faces, to know something of the life of the people he meets.

If you were to call an expert in to inventory your business you would find that the most valuable asset in your business, if you are a real successful merchant, is not in the goods you have or the building in which you transact your business; it is your ability to size up people.

If you do not know how to appeal to the people of your community you can not prepare an advertisement that will bring them into your place of business. If you do not know how to appeal to people you can not touch their emotions, their prejudices, their likes and dislikes in a manner to make them respond as you would have them respond when you are trying to make a sale.

I know that we are apt to think of this subject being a deep and mysterious thing, something that we can not comprehend, something fit only for the consideration of the wise professor. But the human nature that I am going to talk to you about is a very simple thing. It is the nature of the people right about you, the common everyday people we are all acquainted with.

Now, there are twenty more things that I would like to discuss about the people that I know you are meeting every day, their particular actions, and the things that make people act as they do, and how we can learn these things, but I am merely going to repeat that it is absolutely necessary for the salesman to know these things in leading the human mind through the various steps and stages in making a sale.

But the most casual observer has noticed that you can not drive people; you can lead them. You can not argue a man into a thing, but you can lead him to change his opinions, his politics and his religion.

Another noticeable characteristic of human nature is the fact that people are all more or less lazy. People will follow the channel offering the least resistance. Then if you would control people if you would make a sale, make it easy for the people to patronize you. Do not attempt to make them do the work—reach out.

People are universally proud and selfish; never a man but is proud of something. Touch that streak and he will respond—he will follow your suggestion.

But I would impress upon the mind of every salesman the fact that no two people are alike. Men are so many Yale locks; each must have a particular key to unlock his nature. You cannot make a sale by learning a little song by note and repeating it to all kinds and classes of people without thought of their individuality.

The great criminal attorney has learned that he must know the nature of people before he can hope to be able to win and persuade and lead a jury. He must know men and women, he must know the things that enter into the lives of people and make them what they are.

The great evangelist must know people. He must be able to look into the faces of the people before him and see the things away back in their lives. He must know where to look for the tender spot and then he must know how to strike that spot with the most telling effects.

Then I say to you as a salesman, as a business man, you too must know people. You must know their strong and their weak points. You must know how to touch them to get the right response to your actions, your words and your suggestions.

Power in Suggestion

Then I would not feel like leaving this phase of the subject of making a sale if I did not say to you that every normal man and woman you meet is subject to the mighty force that we call "suggestion," and I am going to take a little time to show you how people will respond to that mighty force that is back of the power of the hypnotist, though I would not have you gather from this remark that I want to talk to you about hypnotizing your customers —far from it—but I do want to show you how you can and must employ the same identical principles in writing an advertisement, in leading a person, in making a sale as the professional demonstrator uses when he causes a subject to become rigid before an audience.

You can cause people to look for the things you wish them to see in your goods by proper suggestion, and on the other hand you may often cause people to look for the very things you would rather they would not see if you are not careful, if you do not know how to distinguish between the negative and the positive in your suggestions.

Not only can you induce people to look for the thing but you can make them see about the thing you want them to see.

If the shoe dealer tells people he is right there to make good every deficiency they find in the shoes he sells the people will be looking for holes to come in the shoes; if he tells them the shoe will wear well, it will be a neat comfortable shoe, these are the positive things they will be looking for.

Lessons in Application

Then if you would make a sale—really be able to make the sale—I would say to you first of all know yourself; know how to develop a strong, winning and magnetic personality; learn how to make people feel your suggestion.

Learn to "size up" people. Learn to appeal to the nature of the people about you. Learn what it is that causes people to act, to do things they do. Then learn how to touch these things.

Then learn how to analyze your proposition, your goods, in a manner to appeal to the reason, in a manner to touch the emotional nature, in a way to touch the prejudices of the people.

A pretty cheap man can sell goods to a limited extent if he thoroughly knows his proposition, if he knows all about the thing he is trying to sell, but it takes a mighty keen man to sell a thing that he knows nothing about.

You can never afford to lose sight of the great human element in making a sale. After all is said, we must come back to the place where we started and say that your business is resting upon the people about you. A sale is a mental action; it is the action of the mind, and back of that mind is the imperial individual, the man.

To make a sale you must know yourself, human nature and the great commodities of modern commerce.

Any man with the money can buy goods; it requires knowledge of the art to successfully sell.

The average merchant spends more effort in trying to solve his problems through learning to buy than in trying to learn how to sell.

There is a great art and science in making a sale. It is just as thorough, just as complete as the science of chemistry, but we have not taken the time to delve to the bottom of it.

There are three prime elements entering into every sale: the salesman, the customer, and the goods.

Sale is a mental action. The sale is always made in your customer's head, not in the cash drawer or the order book.

When a salesman fails to make a sale he should know exactly why he failed; there is always a reason. He should not guess the reason—he should know.

We sometimes think of the salesman as a trickster.

The merchant or the salesman who resorts to the little tricks of the trade to get business is a coward. He is afraid to approach people on an equal footing because he knows he does not understand the great art and science of making a sale.

CAMP DEPARTMENT

An Ideal Logging Superintendent

By J. T. Holloway*

The logging superintendent of to-day is the foundation upon which rests the great structure of lumber manufacturing. Upon his department rest all of the departments of the business. When everything goes well with him, all other departments move merrily along, but when the cry of "no logs" goes up, there is sorrow in the camps from the sawmill to the sales office.

There is no department of the business so dependent upon the logging superintendent as the sales department. No mill, it matters not how large its capacity has sufficient stock at all times to fill all mixed orders, so it is necessary to call upon the logging superintendent to rush in logs suitable to make stock to supply items on which we are short.

I believe that the logging superintendent should be as well versed in the grades and manufacture of lumber as in the cutting, hauling and loading of logs. He should also know the actual value of each grade, width and length into which the different grades and sizes of logs should be cut to secure the greatest values when the logs are made into lumber.

The logging superintendent for the long leaf mill, cutting largely for export, cuts his logs to fit the orders on hand. When an order is received by the sales department, a memorandum is handed to the logging superintendent and he cuts logs suitable for the order. The logging superintendent for the export mill comes nearer being "The Ideal" from a sales office standpoint than any other, for, not only must he keep the mills in logs, but he must be a grader of lumber and timber also.

The logging superintendent for the mills cutting for interior or retail trade goes on the even tenor of his way unhampered by instructions from the sales office. Maybe he occasionally receives an order to cut a few long logs from twenty-two to twenty-eight ft., but this only happens once in a while, and for months at a time he cuts his logs twelve, fourteen, sixteen, eighteen and twenty feet (with an emphasis on the sixteen-foot lengths.)

Not only do I believe that the logging superintendent should be a thorough lumberman and fully acquainted with values, but he should also post himself as to the percentage of lengths required in the general run of orders, and cut his logs accordingly. If this was done, we would always have an evenly balanced stock, and not always be "long" on some items and "short" on others. It is true that it is the business of the sales department to keep the logging superintendent posted as to how the stocks are running, but it is usually the case that, when you tell him you are short on 1 x 8—12 No. 1 common and must have some logs quick, he is forced to cut more or less timber that is not suitable for this item.

At Smallest Cost

In this day of competition, I fully realize that "the ideal logging superintendent," from the viewpoint of the president, general manager and stockholders, is the man who can get the logs from tree to pond at the smallest cost to the company. This is not only true with regard to the logging, but with all other departments of the business, and will, no doubt, remain the standard by which all department managers will be judged, until the bulk of our lumber has disappeared.

For many years I have contended that we were sacrificing value on the altar of cheapness in all departments, but, being hopelessly in the minority, I do not anticipate my ideal with regard to this being realized until the manufacture of lumber reaches its last stages, nor would I pluck one laurel from the brow of my "ideal logging superintendent" on account of him not taking independent action for value against cheapness for being "a Roman," he must of necessity do as "Rome does."

The sales manager and the logging superintendent should have more than a speaking acquaintance; not that I flatter myself by presuming that, by forming my acquaintance, the logging superintendent would be a more ideal man or citizen, but I do believe that, if the logging superintendent would visit the sales office and plant often and post himself as to the general run of orders and conditions of stocks and discuss market conditions with the sales office, the information thus obtained would be of great benefit to both, and, especially, to the sales office.

I also believe that the sales manager should pay return visits to the logging superintendent and post himself as to the class of timber on which the sales office must depend for stock with which to fill orders and acquaint himself with the conditions under which the logging department is laboring.

I do not believe that absolute perfection will ever be attained in any of the departments, but, with the mills catering exclusively to the interior trade, I am fully convinced that, with these suggestions put into practical use, a long step toward the "ideal logging superintendent" from a sales manager's point of view will be attained.

In conclusion, allow me to refer to one thing that has been a nightmare to me in the long years that I have been in the sales department, which is: not a sufficient amount of twelve-foot common logs in proportion to other lengths. When I shall form the acquaintance of that gentleman, who will supply this deficiency, I shall certainly pronounce him my "ideal" and shall crown him prince of logging superintendents.

If I have said anything in these rambling remarks which has, in any way, offended you, I must humbly beg your pardon, and will ask that you charge it to an amateur, who is unaccustomed to the preparation of "state papers."

Sanitary Fundamentals for the Camp

By Dr. Oscar Dowling

Since the most important factor in efficient service is the health of those employed, it is scientific management to control environment by constructive measures. More specifically, to do everything possible for the promotion of the health, comfort, and contentment of the force and to use means to ward off disease.

In a camp, the general features are sanitary conditions, including situation, water supply, sewerage, and waste disposal; more particularly, with reference to the individual, food, medical care, and sanitary discipline.

The camp should be placed on high ground near an adequate and healthful water supply. The situation of sanitary conveniences is important that odors may not be carried by prevailing winds towards the sleeping quarters. Kitchen refuse and all other objectionable waste should be burned or buried and at some distance from the water supply. There should be provision for bathing. Even in the most primitive camps a tent, or hut, should be set aside as a bath room. This is practicable and necessary, even if the daily bath is only a rubbing with a wet towel.

Plain food, well cooked is generally provided, but variety is lacking. It is a mistake to confine the diet almost entirely to meat and bread.

Perhaps the two most difficult features of management are medical preventive measures and sanitary police supervision. Recklessness and ignorance on the part of the majority make both obnoxious, yet both are necessary for the inauguration and maintenance of hygienic conditions. Stringent rules should be enforced relative to use of sanitary conveniences for the protection of all, and as far as possible the men should be taught the dangers of excess in eating and drinking and the more imminent danger of all classes of communicable diseases. A man with tact and some knowledge of these things should be known as a sanitary police officer and should be given a definite, if limited authority, over the men in these matters. These measures should obtain in both temporary and permanent camps.

Where men are gathered together in working crews, vigorous efforts are essential to make conditions livable. It is a hard life at best, the tendency being toward the expression of the lowest appetites and impulses. Therefore, those in charge have great opportunity not only for the amelioration of hardships but for the development of higher standards of thought and habits.

Many Ties to be Cut in North Western Ontario

A large quantity of ties will be taken out in the woods this winter east and north of Fort Frances, Ont., for the Canadian Northern Railway Company. The largest single contract is that of Mr. P. P. Elliott who has a contract for getting out 300,000 ties. In addition to this, Mr. Elliott has a contract to take out 250,000 for the Grand Trunk Pacific along the line of that road north and east of Kenora. Mr. James Harty will take out about 50,000 while H. H. Wood of Mine Centre and A. M. Struve will also take out a large number for McKenzie & Mann. The lumber companies such as the Northern Construction Co., Shevlin,Clarke Co., and Lockhart & Co., will take a number as usual in order that their limits may be cleaned up as they go along. The Rainy River Lumber Co. will put in only one camp this season while the Shevlin-Clarke Co. will put in 9. The Rat Portage Lumber Co. will take out a few logs. The cut of lumber will be somewhat curtailed as the yards are pretty will stocked up and the markets are dull.

---

*Address delivered before the Southern Logging Superintendents' Association

Logging in a Cypress Camp

"Cypress Logging from Stump to Car," was the title of an address delivered by F. S. Booksh before the first annual meeting of the Southern Logging Superintendents' Association at New Orleans on September 27th. As an example of the difference in logging methods in the south, compared with Canada, the address is of much interest. Mr. Booksh spoke as follows:—

We build our main line railroad with a piledriver, the driver has four drums, two for the hammer lines, two for the lines we use in pulling dunnage logs, etc. We also have a boom on the driver that fits in between the leads and projects out twenty-four feet in front of the machine. We have two blocks on end of this boom through which our dunnage ropes pass. We use lines 250 feet long, and can pull dunnage and logs 150 feet each side of track, in this way we get all the material we need using anything that will not make a saw log. We place a crosstie every thirty inches and spike to them only. At stated distances or every low place where it is necessary, we leave an opening for drainage purposes. We pile the distance we think necessary for the opening to be, using crossties from one pile to the other and drift bolting ties to the piling. In crossing bayous and sloughs we do the same. Building road in this way we average 180 feet per day, at a cost of the work of eight men. This puts the road in condition to receive the dirt. Our dirt cars are made thirty feet long, and eight feet wide with 2 x 6 lumber for flooring put on loose, and we load them with a small steam shovel, at the nearest point to the work that we can find a sand pit. In this dirt outfit we use two men on this steam shovel, and two men on locomotive. It costs us in the neighborhood of seventy-five cents a car delivered at the unloading grounds for labor. The unloading is done with our section crew by removing the loose flooring which lets the dirt fall in the track where it is needed, and saves rehandling. We fill in the track to the top of the rail. One car usually fills in thirty feet. When cars are all unloaded and gone for another load, the section crew of five men proceed to distribute the dirt. They do this by jacking up the track with two track jacks placed opposite each other, and raising same as high as possible, the men then get in between the ties with shovels and distribute dirt as evenly as they can. Dirt must be dry so that it will run in between logs and dunnage, and fill in all crevices. As a rule this puts the iron about eighteen inches high and covers all logs, etc., previously put under the track. After this dirt becomes settled and solid we put another coat of about eight inches on the road. Ordinarily this is high enough for our swamps, and the road is complete. In very low swamps we use piling altogether, seven bents to the rail of thirty feet and puts the track just above the water mark. In building this kind of road we build from ninety to one hundred and twenty feet per day with same crew.

How to Build Branch Roads

We place our branch roads 1,000 feet apart and build them with what we call jumbo (a hoisting engine and boiler placed on a good strong flat car thirty feet long with a boom thirty feet long projecting in front to pull in dunnage, logs, etc., and also to clear the right of way of saw logs or any other obstruction that might be in the way). We use logs for ties on all branch roads, anything that is not fit for a sawlog. When we have finished pulling timber from these branches we take up iron and leave all logs used as ties behind. We try to get our mast trees from 750 to 800 feet apart. In this way we never have a line over 650 or 750 feet to pull, even at the corners. Experience has taught us that it does not pay to pull long lines for the reasons that it is much harder on the machinery, wire lines, slower, and harder to keep up the proper amount of steam. In selecting mast trees we should try to get them as tall as possible; it is a drawback to have a low rigging; the main cable especially should be placed as high as possible. This will aid you in lifting the logs being skidded above any obstruction that might be in the run. Tree chains for main cable and skidding block should be very strong. One and a half inch steel with five inch links we find to be very satisfactory. Black spars should not be over 150 feet apart; this will give a side pull of seventy-five feet at the furthest point; anything over that distance will cause too much loss of time. It is cheaper to change lines oftener than to make long side pulls, with a good rigger lines should be changed in from twelve to twenty minutes. We use a Lidgerwood skidder and eighteen men in a crew as follows: One skidder man, one loading lever man, one fireman, one tong shaker, two ground loaders, two tong hookers, one line cutter, four slack pullers, and five in the rigging gang. For a great number of years we lost considerable time by breaking piston rods on our skidder and to overcome this, two years ago we increased the size of same from one and a half inches to two inches, and since that time we have not broken one. We use the following size wire rope for rigging, one inch for cables and guy lines, three-quarter inch for skidding line, three-eights inch for receding line, and one-half inch for transfer line. These smaller ropes with constant use will last eight or nine months, and should pull 9,000,000 to 10,000,000 feet of logs. Cables will last from fifteen-to-eighteen months or longer. In making our skidding and loading tongs we use round edge Titon tong steel thirty-six inches long, one and three-eighths inches thick and two inches wide for skidding tongs. Loading tongs are made of same material thirty-four inches long, two inches wide, and one and one-eighth inches thick. This steel does not break. We have been using several for more than one year and they appear to be as good as ever.

Our log cars are built witih eight-foot bunks, and if the timber is sound will hold from 2,500 to 4,000 feet of logs.

Pointers for Log Cutters

By Thomas Laffin

Different log jobs require a certain number of changes in one's system, but there are some rules that all can follow in cutting timber.

First of all a scaler or saw boss should have authority to hire and discharge his sawyers as he sees fit. It is this man's business to see that each sawyer has his saw properly filed.

Timbergrowing very close should be cut to fall one way as much as possible. By doing this you do away with much unnecessary swamping and make it much easier for the teams. Trees that fall across others should have a prop placed under the higher end before it is cut into logs; if this is not done the weight of a log falling that distance would more than likely split the end.

Sawyers should be cautioned to cut logs clean. Splinters are sometimes carelessly left between them; this makes work for the bunching team and should be avoided.

Not more than a twenty-inch stump should be left in felling a tree. It is then measured from butt to top, allowing two or three inches for trimming, to each log.

Unfortunately all trees are not perfect. We find some with defective butts. These must have enough cut off to make sound logs. It is a useless expense to haul defective butts to the track. Leaning trees should be heavily notched on the lower side. Saw deeper at the ends of this notch than at the back. It is well to cut all butt logs sixteen feet long. Then if you should discover a defect there would be enough log left to cut saleable lumber.

Small trees should be cut twenty feet long. This saves unnecessary labor with a useless top. Usually there is but one log to a tree of this kind.

Logs cut by the thousand should be scaled with a caliper rule. Every night the scaler should figure cuts of each sawyer and deduct bark from the average scale.

It is impossible to log one piece of timber just like another; because if one man does not have his work done as you do is hardly proof enough that he is not using the best system. One rule for all: "Find a system to suit conditions of each job."

Suing for Destruction of Timber

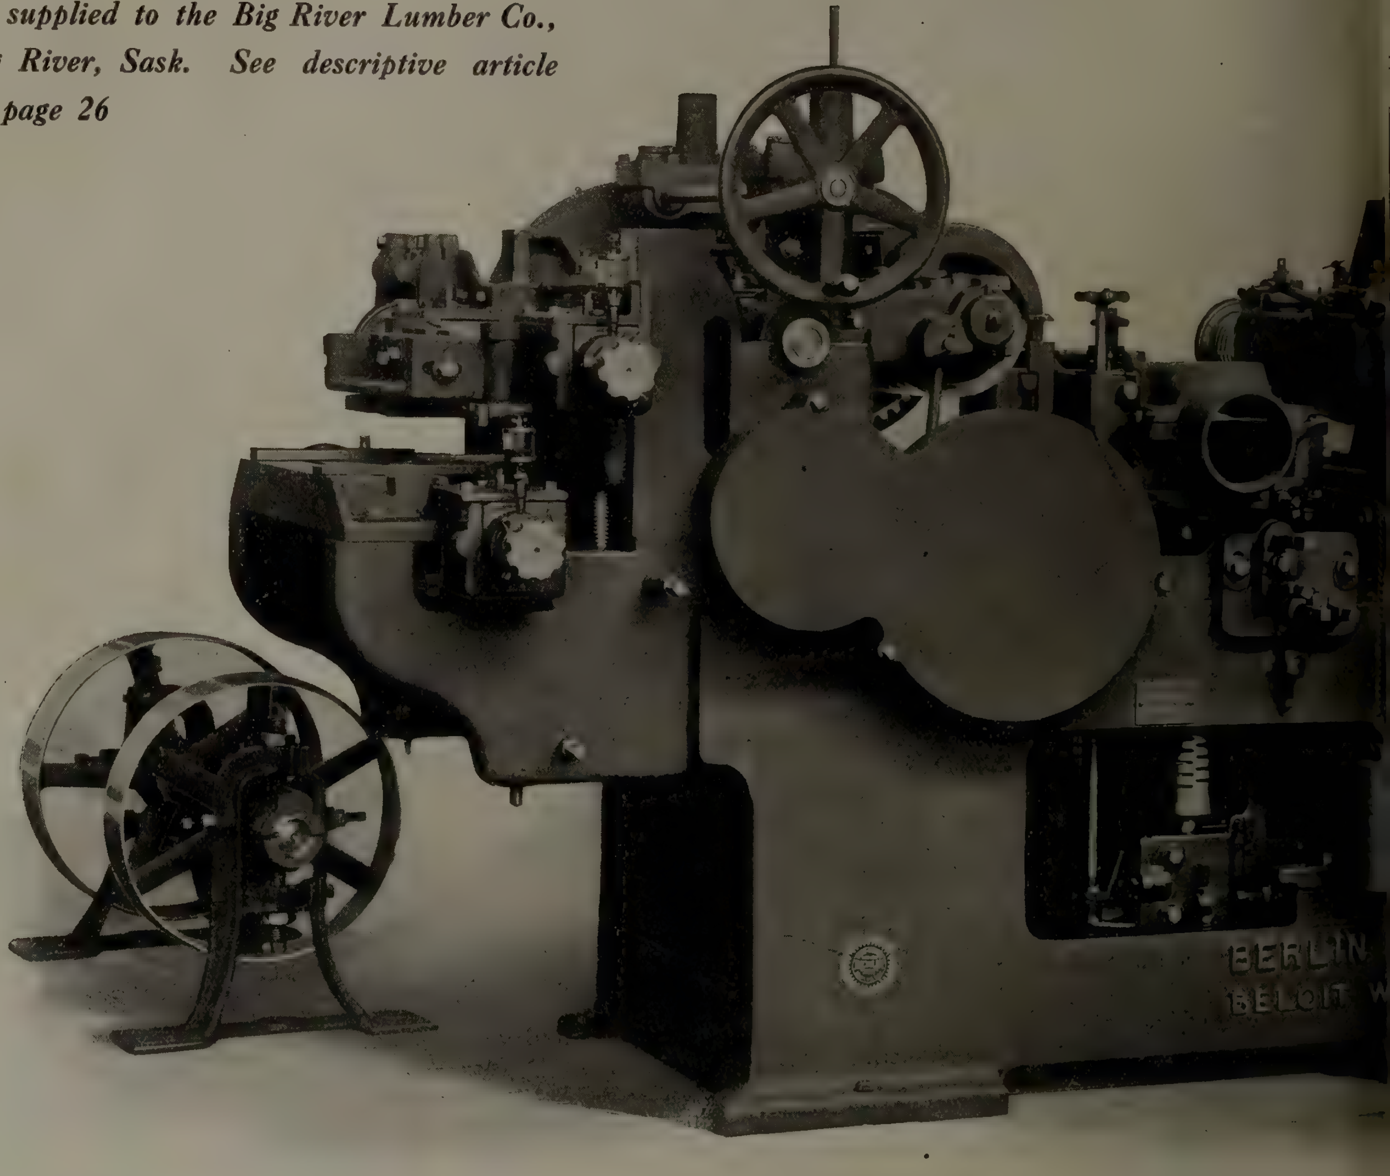
The case of Clarkson vs. the Nelson and Fort Sheppard Railway will again occupy the attention of the B. C. courts in the near future. Last February, after a four days' session, Mr. Justice Morrison of the Supreme Court decided that the responsibility for the fire which destroyed the timber on 208 forty-acre tracts lay with the Nelson and Fort Sheppard Railway, a branch of the Great Northern Railway. The case now to be argued before the courts concerns the amount of the damage. The plaintiffs are E. R. C. Clarkson and the Clarkson Brothers of Toronto, and John Ryan and Felix Donnelly. The amount of their consolidated claims is between $500,000 and $600,000. It is expected that the evidence to be presented before the court will occupy about 40 days and that the case will therefore be one of the longest on the records of the British Columbia courts.

In the pioneer days of Ontario nobody considered it wasteful to cut down and burn the standing timber in great quantities. This was really a part of the essential expense of procuring a clearing from which to obtain a living. To-day the situation is very different yet it is claimed by many of the people of the newer parts of Ontario that they are obliged to pile and burn much of their valuable pulpwood, simply because there are not requisite roads for getting it to a market. At present it is said that the roads do not extend to within reach of one-fifth of the land which has been taken up. Under the new Minister of Lands, Mines and Forests it is hoped that a progressive policy of road building will be commenced. It would be a wonderful day for all of New Ontario if this were the case.

The Colonial Wood Products Company, of Thorold, have ordered a centrifugal pump from the Smart-Turner Machine Company, Limited, of Hamilton.

Berlin "NINETY" Matche

As supplied to the Big River Lumber Co., Big River, Sask. See descriptive article on page 26



CYLINDERS

Berlin fast-feed cylinder heads cannot be ruined. The gibs used are of hardened steel. There are no wearing parts that form a part of the head itself. The size of the spindle next the head shows that it will not spring under the cut. The gib forms the lip for the under side of the knife, thus forming no place for chips to wedge in.

SIDE HEADS

12-bitted ship-lap or 6-bitted round jointer heads may also be furnished if desired. These heads as well as others may all be sharpened on our Pedestal Side-head Grinder. We have the only 12-bitted side-heads ever manufactured. Side-head jointer is also furnished.

BELT TIGHTENERS

There are two features about our automatic belt tightener construction that stand out prominent. In a recent test covering a period of nine months, night and day run in one of the largest plants in the world, a Berlin "90," a stock-model as above, ran night and day for over nine months and d
that entire period **not a single belt was taken up.** Every tightener is
matic, works on the slack side of the belt, and the belts may be release
lifting up the tightener pulleys. These flexible tighteners as compared
the screw method by which terrific pressure and friction is applied to
belt, make a saving of 25 to 50 per cent. in the horse-power required to
the machine. Belts may be put on endless and run for months and y
without being taken up. There is no unnecessary strain on the belts and
heads will handle the heaviest cuts. The life of the belts is tripled.

CHAIN DRIVE

In place of the great number of gears which are found on any
matcher, the number of which run up to 30 to a machine, we designe
automobile chain drive consisting of a power automobile chain running
hardened steel sprockets. This applies to both front and rear rolls, redu
the number of gears on the entire machine to a minimum and affordi
drive that is positive and will never give trouble. The chain drive use

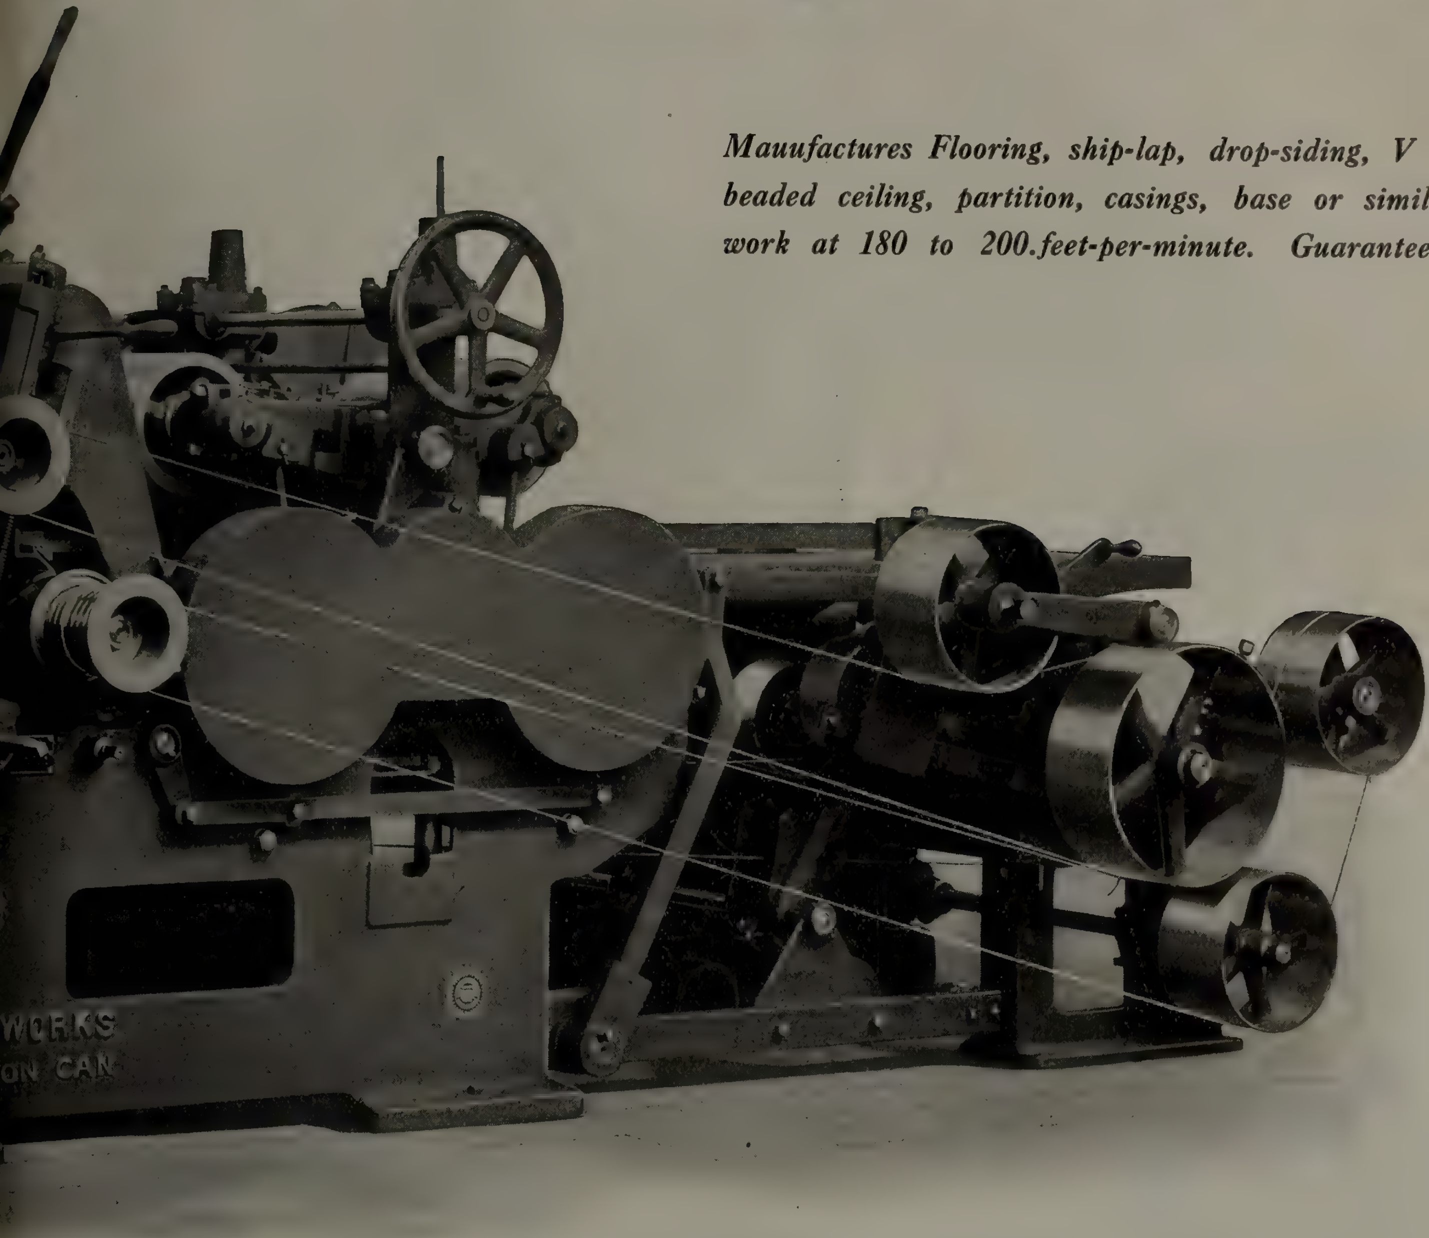
Berlin Machin

Plants : **Hamilton, Can**

ith Profiling Attachment

Mauufactures Flooring, ship-lap, drop-siding, V or beaded ceiling, partition, casings, base or similar work at 180 to 200.feet-per-minute. Guaranteed.



n fast-feed matchers, by actual test, is capable of transmitting seven the work required of it. It is practically noiseless in operation and mits no vibration to the working parts. Every part is protected from ngs but is instantly accessible. Belt with tightener connects the in- ng and outfeeding rolls.

PROFILING ATTACHMENT

he most simple device on the market of its kind. Consists of two heavy les at out-feeding end of machine, driven by one belt, with tightener. spindles are carried between double bearings, exactly like that of the der heads. End play in spindles is automatically kept out all of the and wear does not effect our device in any way. Cross-adjustment is provided. The profiling heads are 6-bitted and may be furnished for all of work and the tightening operation self-centers them on the spindle. ges for different runs may be made in a few moments time. Jointing es for top and bottom heads are furnished and the knives may be ed no matter what form they take.

FRAME OF MACHINE

Cast-in-one solid piece, affording the sturdiest foundation a machine could run on. While some say there is no advantage, the real reason is that no other wood-working machine foundry has the facilities to cast matcher frames in one piece. Any practical man can see that with the one-piece frame and the weight properly proportioned, the vibration is considerably lessened and the machine will always be in line even if the floor sags a little.

FEED-ROLL POWER

Spring tension on all feed rolls, thus automatically regulating the pressure on stock as well as feed power consumed and removes all jar so common on weighted roll machines by the entrance of heavy stock under the rolls and again when they drop off. Springs are adjustable to suit any weight of stock of varying thickness.

SPEEDS OF FEED

Guaranteed to turn out perfect flooring and ship-lap at 200-feet-per-minute and handle formed patterns such as drop-siding, partition, base, casings, etc., at from 150 to 180-feet-per-minute.

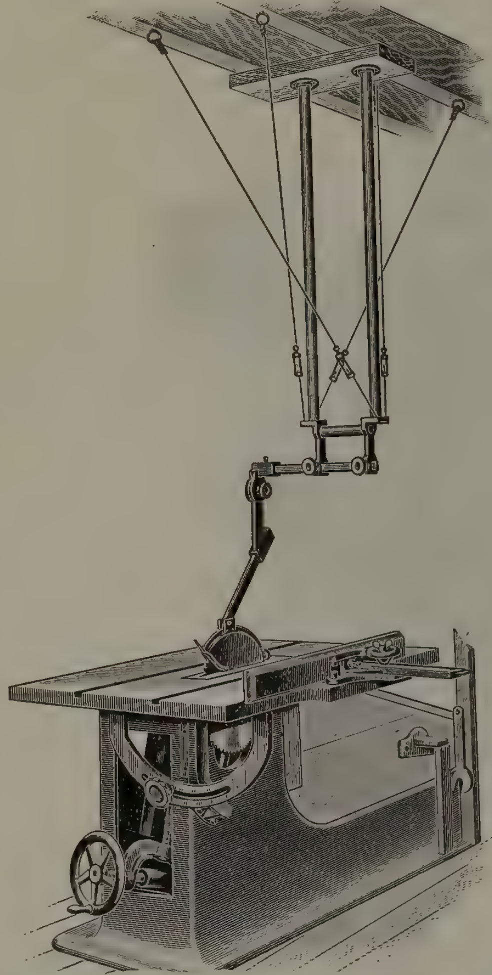
THE WOODWORKER

Safeguards in Woodworking Plants

A valuable publication entitled "Woodworking Safeguards," written by David Van Schaak, Director of the United States Bureau of Inspection and Accident Prevention, has been published at the price of $1.00 by the Aetna Life Insurance Company, Hartford, Conn. As indicated by the title the book deals exclusively with the various types of safeguards for the prevention of accidents in lumbering and woodworking industries. Beyond question it will be of practical value and will aid in impressing upon manufacturers, the wide range of possibilities in safeguarding, which with some variation, will be applicable to many of the special machines and operations that cannot be even touched upon in a book of such limited extent. The book opens with a general discussion of the necessity for adopting every possible precaution for the safeguarding of employees. Chapters then follow upon the various branches of the lumber and woodworking industry and the types of safeguards which may be adopted for the prevention of accidents to employees engaged therein. The various chapters include the following: logging, sawmill, planing mill, circular saws, band saws, jointers or buzz planers, shapers, sanders, handles, lathes, wagons, and cooperage; veneer, furniture and chairs; pattern shop and box factory; power generation and transmission; grinding wheels and elevators, etc.



The Jones Saw Guard.

An example of the valuable and interesting information contained in the book is afforded by an excerpt. The chapter upon circular saws contains the following:—"The circular saw is at the same time about the most convenient and the most dangerous of woodworking tools. The variety of uses to which it is applicable is only equalled by the variety of accidents which it can cause. A very large percentage of saw accidents is attributable to the carelessness of workmen, but it is only natural that men working in close proximity to danger should come in time to lose the constant sense of it which is present with them at first. This is bound to happen even in the case of men who are naturally very careful. As for a new man on a saw, he may get dangerously near the teeth despite his utmost care. When a saw is revolving, the space between the teeth shows up much lighter than the solid part of the blade, sometimes seeming to be hardly more than a light blur. Again, a sawyer's attention is open to distraction by innumerable things, any one of which may cause that only slight displacement of the hand which will result in an accident. And, too, there are many dangers connected with the operation of saws which the utmost carefulness cannot surely avoid. Such a dangerous tool demands that every effort be made to guard it."

Dealing then with rip saws the writer refers to the form of guard known as "splitter" which is illustrated and described minutely. Then follows a description of the various hood types of guard in which reference is made to one of the products of the Jones Safety Device Company of Buffalo, N. Y., and Hamilton, Ont. Dealing with this type of guard the writer says "Some prefer hood guards, supported from above or from a standard at the side of the table, to splitter ones, on the ground that, in addition to keeping wood from climbing, they prevent such kicking as may result from a knot or change in grain being struck or a piece jamming between saw and guide or being dropped on the teeth, guard an operator better against being cut by the saw teeth, keep slivers, loose knots and pieces of knots from striking him, and protect him against blinding sawdust. It is always best, however, to use a splitter in connection with a hood guard, whenever possible.

A hood guard should be kept down as close as possible on the material. To enable the sawyer to see the line of his cut well, the hood can be turned up a little in front, or the top or all of it can be made of wire mesh. The Germans often leave the top open save for enough cross-pieces to hold it together, and frequently their hoods have slatted sides also. A hood should always be wide enough to allow for vibration, which should be guarded against by having the supports substantial, keeping taut any guy wires used, and having adjustment joints tight enough to avoid lateral vibration. A hood should also be deep enough not to touch the crown of the saw if it should fall.

The illustration shows a hood guard, made by the Jones Safety Device Co., of Buffalo, N. Y., which automatically adjusts itself to different thicknesses of material. It is furnished with either sheet steel or wire hoods, and they can be of closed variety or with open front. The hood is equipped with a steel dog at the rear."

Planing Mill Cost-Keeping

It seems to me that all planing mills should know the exact cost of all articles they manufacture. There are a great many different systems for arriving at net cost of production; but what's the use unless the whole concern, manager, superintendent, foreman and workman, all co-operate in arriving at the cost? No set of office men, with all of the system in existence, can compute the cost of an article without the co-operation of all concerned in its manufacture.

I think the time card system a very good one, and to convey my idea, herewith give a sample card:

All orders are billed by superintendent or foreman, and given a number, beginning with the first of the year. The workmen must be accurate in giving amount of lumber, kinds of lumber, and actual time on each job.

Educate your men up to a standard of efficiency. Do not try to drive them. Get them interested in their work. This can be done in many ways. If an employee is not interested in his work and has not his employer's interest at heart, he is no profit to him. How nice it might be if we would all live and let live, and all pull together!—Washington in The Wood-Worker.

The Foreman and His Quallifications

Qualifications of an ideal foreman are many and varied. It is true that no one individual can expect to possess all of them, perfection is a thing unknown in this workaday world, but their consideration may help to bring some of us a little nearer the desired goal. Like the requirements for success in all occupations, some are natural, but more can be acquired by earnest and persistent effort.

It is generally supposed that a man is chosen for advancement because he possesses what might properly be called the natural qualifications for leadership in larger measure than his fellows. In this connection, I am reminded of Shakespeare's "Some are born great, some achieve greatness, and some have greatness thrust upon them." The first class are represented by those who owe their positions to family influence and "pull," the next are those who have risen through ability and sustained effort, and the last hold their position by force of circumstances even if they are not particularly well fitted for the place they fill.

In many places I think that managers do not consider the position of foreman sufficiently important to pay the wages that a man who can fill it ought to commmand. It is often considered that an advance of twenty-five, or, at most, of fifty cents per day over the wages of the ordinary workman, coupled with the honor (?) of the name, is sufficient remuneration for faithful and efficient service as head of a department. Of course, much depends on circumstances and local conditions, but there are many places where brains can be used to as good advantage in the factory as in the office. The requirements of the factory position may be different in kind, but no less in degree, and the compensation should be fixed accordingly.

One of the first requisites of a good foreman is what is known as executive ability, the art of handling help so as to obtain the maximum of output with the minimum of expense. Though it might be counted in some measure a natural gift, it can undoubtedly be greatly developed by study and careful cultivation. Oftentimes there are ways of getting much greater results from men without driving or overworking them. Careful planning of one's work goes a long way. The foreman whose men always have to follow him up to get another job, can never equal the one who makes it a point to keep the work continually ahead of his men. Most of them are in a hurry to look up work but if something else is waiting for them every time they have no excuse for being idle. It is a truism that men will accomplish more when the work is pushing than when they don't know where the next job is coming from or whether there will be any next job.

In order to obtain the best results from each man, the foreman needs also to be a fairly good judge of human nature and be able to size up the individual workman. While he should be strictly impartial, it is often necessary to employ different methods with different men. Most of them can be led more easily than they can be driven, yet firmness without obstinacy should be the foreman's guiding principle in dealing with his help. He should also remember that he is not infallible and be willing to listen to suggestions from any source, albeit he is not obligated to adopt them. It is quite possible that valuable ideas may emanate from humble sources. The wise man is always ready to profit by any that come in his way. It is, however, the most contemptible kind of thievery to draw out another's ideas and pass them off as one's own, as is too often done by unscrupulous people.

System and Red Tape

If satisfactory results are to be obtained, a certain amount of system in one's work is not only desirable but necessary. Nevertheless, it must not be carried so far as to degenerate into red tape. System is a useful and valuable servant but when positions are reversed and the man becomes the slave of his methods, the results are as disastrous to economy as an entire lack of system. Differing conditions and kinds of business call for varying plans and a careful study of the requirements of one's own line, coupled with a knowledge of what others are doing in similar circumstances, will enable the intelligent foreman to devise a serviceable and economical system for his own use. Ideas are often met with in the various trade journals which can be adapted to local conditions so as to improve them. Eternal vigilance is the price of success.

Between the management and the foreman is often a wide difference of opinion as to how much manual labor he should perform besides attending to his other duties. The first duty of the foreman is to see that all of his help is efficiently employed all the time. In many cases, where there is a large territory to cover, that is all that he can possibly do. The head of a small department may often be able to accomplish considerable at odd times or even to keep employed a large share of the day. It certainly is poor management for a $4 foreman to be doing a $2 man's work and then have two or three of the latter chasing around after a job or killing time because the foreman is too busy to look after them. The ideal whom we are considering will not make the mistake of neglecting his own work to do another's, neither will he be too proud or too lazy to do anything that comes to his hand whereby the efficiency of his department can be increased.

The idea is often advanced that the foreman should be able to perform any part of the work which those under him are doing and it would be a desirable condition of affairs if such were always the case. It is not absolutely necessary that it should be so. That he should be competent to judge the quantity and quality of the work each man should accomplish is self-evident. Yet that does not mean that he must be able to do it himself, or even be conversant with each step of the process. Here, as elsewhere, an absolute rule as to qualifications cannot be laid down except the general one of capability. There are those in authority who are never satisfied with any amount of work that a man can do, simply because they do not know how much he ought to accomplish. On the other hand, some may be hoodwinked by the unscrupulous workman for the same reason. All of which goes to show that the ideal foreman must possess the best judgment and be always prepared to exercise it.

"Manners Maketh the Man"

One who has the confidence of his employer in such measure as to be placed at the head of a gang of men naturally has some reason for thinking that he is in some respects better than those over whom he has authority. Yet he can do nothing that will detract from his efficiency quicker than to show any feeling of that kind, especially in an offensive way. On the other hand, he should not allow any undue familiarity on the part of his men as a reasonable discipline must be maintained. Outside of working hours, there is no reason why he should carry his authority with him and look over the heads of those who may be his superiors in some respects though working under his direction. The golden rule is especially applicable here, and there can be no better motto for the foreman to hang over his desk—and live up to. From the modern cynic's point of view, "Do unto others as ye would that they should do unto you," (i.e., when similarly situated) is a precept too old-fashioned for these days, but the practice of it is nevertheless good business policy, to say nothing of it from the standpoint of ethics.

In order to accomplish the best results, a foreman must have full authority in his department. Unless this is given, it is an injustice for the management to hold him responsible for his output. If he does not actually hire his own men, he should be supplied with those who are competent and be allowed to discharge any who do not conform to his ideas. No man with independence enough to qualify him for a responsible position will assume the burden unless he can handle the help in his own way. There are a few managers who will insist on looking after all details personally (when they feel like it) and even change men from one job to another without consulting the foreman of the department, but I am glad to believe that their number is small. No foreman worthy of the name would submit to such treatment very long.

Even temper is another requisite for success in leadership. Foremen who are passionate and flare up on slight provocation certainly cannot retain the respect of their workmen and may lose the best of them when most needed. People try to excuse their bad temper on the ground that it is a matter of temperament for which they are not responsible but there is no doubt that it can be controlled to a great extent by constant watchfulness. At any rate, he who either cannot or will not restrain himself is not fitted to direct the work of others.

Harmony and Loyalty

A frequent cause of loss and non-efficiency is a want of harmony between the heads of different departments. Personal feeling takes precedence of duty to the employer and his interests suffer in consequence. The man who can rise above prejudice and do his duty regardless of any private opinion he may have of the other fellow is the one whose merit ought to be recognized by his superiors, and in all probability will be. Undoubtedly many such differences could be smoothed out by the use of a little tact on the part of manager or superintendent, but the fact remains that there are many factories where the work is seriously hampered and the output lessened by the lack of team work.

That the foreman should be loyal to his employer and keep to himself any matters of business of which he is cognizant by virtue of his position goes without saying. The blabber cannot expect to be selected for any place of importance. In short, the perfect foreman must possess all the virtues and none of the vices and also be especially adapted to his work. The proverb has it that the leopard cannot change his spots and it is probably true that an efficient foreman cannot be made of a man who lacks certain natural qualifications but it behooves all who are occupying such positions to see that their work does not suffer because they lack others that can be acquired. Being but human, we are all poor enough at our best.—Wood Craft.

Canadian White Spruce for Navy Oars

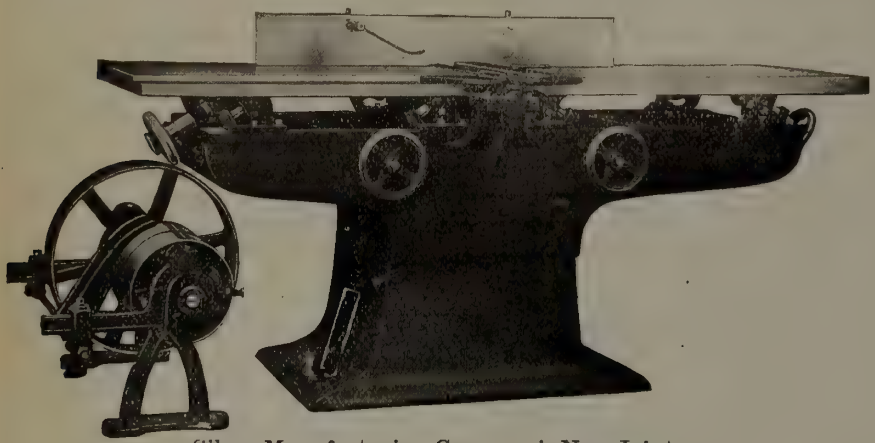
The Canadian Pacific Railway announces that the British Admiralty has placed an order for 200,000 feet of Canadian white spruce to be used in the manufacture of oars for the rowboats of warships. It is perhaps not generally known that the superior quality of the white spruce grown in the Queen Charlotte Islands, off the coast of British Columbia, was discovered years ago by British naval officers of the North Pacific station. The kind of timber was found to be ideally adapted for making oars, and it is now used exclusively for that purpose by His Majesty's vessels throughout the world. The timber will be shipped via the Canadian Pacific Railway.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

An Excellent Catalogue

The Silver Manufacturing Company, Salem, Ohio, U.S.A., have just issued a new catalogue of their numerous and excellent productions. The catalogue is attractively prepared and embraces all the articles manufactured by the company, together with a complete repair list. Splendid illustrations accompany the reference to each article and give the reader a practical idea of the importance and their possibilities. The catalogue contains cipher words in addition to the price list, so that customers finding it necessary to telegraph may do so conveniently. For the accommodation of their foreign customers a special discount sheet is included, embracing cost of boxing goods for ocean shipment, etc. This information, together with the export weights and measurements, which are also given, enables the buyer in a foreign country to figure the cost of the goods laid down at their own port.



Silver Manufacturing Company's New Jointer

The Silver Manufacturing Company's products embrace several distinctive lines. All of the articles are standard makes, the merits and efficiency of which have been established by years of practical use. The various tools and machines are kept well abreast of the times by improvements which are made from time to time, as necessity warrants.

The factory of the Silver Manufacturing Company was practically rebuilt and greatly enlarged during 1909, upon the most approved factory designs. Since that time the rapid expansion of their business has necessitated very large additions to various departments, in some cases doubling their capacity. The factory is commodious and convenient, and is equipped with every facility for the proper and economic manufacture of goods.

It is equipped with modern and especially designed machinery adapted to its particular work. Switch connections with the Pennsylvania and Erie railroads enable the company to secure fuel and all materials at their works and to send out carload shipments in the most expeditious manner. The company make a specialty of carrying full stocks of goods, so that they may be able to give prompt execution to orders.

In the manufacturing department great care is exercised in seeing that each part is correctly manufactured and that the tools are properly constructed, and put together, so as to insure accurate operation. The company are now shipping to every state in the Union and also to every civilized country.

Among the products of this company which are of especial interest to woodworking institutions, are the "Silver's new Jointers," an illustration of which is shown herewith. These jointers are built from entirely new designs and patterns, and are made in five sizes with 8, 12, 16, 20 and 24 inch knives. The frames are made in column form, of the most substantial construction with large floor base. The cylinder heads are milled from solid forged steel and are T slotted on two sides for moulding, rabbetting and other cutters. For the protection of the operator, a movable guard covers the unused portion during work. The pulley is four inches in diameter and of ample width for a 4-inch belt. One 8-inch machine is manufactured with a 3½-inch diameter pulley for a 2½-inch belt. The journals are of good length and diameter and are lined with the best copper-hardened babbitt. They are provided with large oil chambers and self-closing oilers. The journal on the pulley side is 7 in. long; the one on the operating side is 5 inches long and capped to prevent the escape of oil. The vertical and longitudinal adjustments of the table are simple and unique. They are independent of one another and can be regulated while the machine is at rest or in motion, to suit the thickness of cut or to close the gap over the head.

The steel pin inclines on which tables are mounted are a decided improvement over the old slides or grooves. They are absolutely uniform and have split bearings, clamped with set screws, to take up wear and keep tables always firm. The vertical movement of the table on these pins is controlled by hand wheel, at the end, and an auxiliary handwheel rigidly locks tthe table at any desired level. Without disturbing this level, the tables, and attached sliding frame can be rapidly withdrawn from knives, making the same easy of access for sharpening, adjusting or substituting special cutters. This movement of the table is governed by hand wheel on the working side of the machine, by means of cog rack and pinion—totally different from the ordinary construction. The same hand wheel by clutch device, firmly locks the whole. This device is new and "patent applied for." The sliding frame is dovetailed into the main frame, with adjustable gibbs on the side to take up wear.

The tables are of iron planed perfectly smooth, are about 32½ inches from the floor and the rear table is constructed for rabbetting. The front table is 42 inches long and the rear table 36 inches. On the 8-inch machine the front table is 36 inches and the rear table 30 inches. When desired a special rabbetting table to attach to the regular table is furnished at extra cost.

The fence can be tilted to any angle from 90 to 45 degrees and can be moved to cut full length of knives. A pressure spring is provided for holding the work to the table.

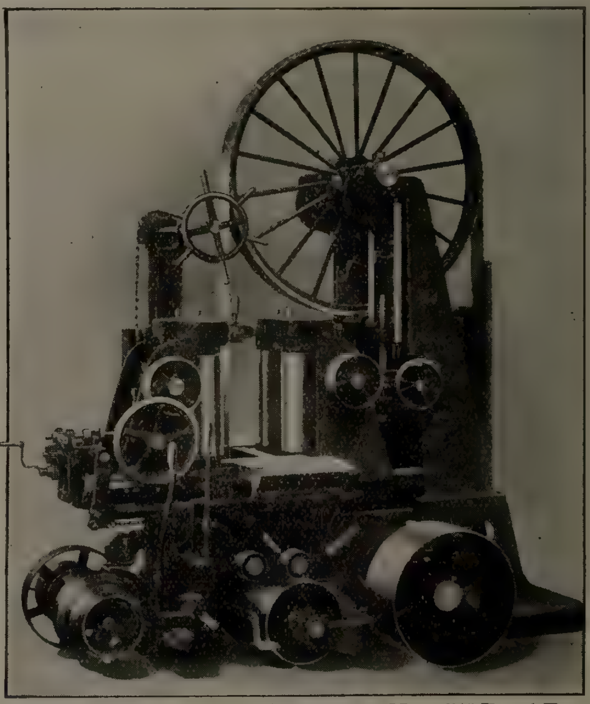
The countershaft has tight and loose pulleys 10 inches in diameter by 5 inch face. It should be speeded about 800 revolutions in order to give the machine a speed of 4,000 revolutions per minute. The loose pulley is self-oiling.

Among the other machines manufactured by this company which are of particular interest to woodworkers may be mentioned Silver's planetary combination foot and belt power band saw; Silver's improved power band saw, with Wright's patent non-friction roller saw guide; Silver's new saw table with safety guard and pivoted auxiliary frame for vertical adjustment of saw, and Silver's new swing cut-off saw. All of which are excellently described in this interesting catalogue.

A New Ball-Bearing Re-saw

Readers of the Canada Lumberman & Woodworker will be interested in a new 54-in. band resaw recenly added to the American line. The illustration shows a view of this machine from the operator's side.

The manufacturers call this tool their No. 111, and claim it to be the heaviest 54-in. band resaw on the market. In a circular they set forth the following points of merit.



American Woodworking Company's New 54" Band Re-saw

The upper wheel is hung on a straight-line-knife-edge balance, and runs between bearings. This form of construction, they claim, makes a very sensitive strain and a well-balanced rigid support for the upper wheel.

The feeding mechanism is driven by open belt and cone pulleys, operated by a friction clutch. The only gears used are the ones on the top of the rolls which are encased. This makes a very strong feed, which the makers claim is far more durable and more effective than any variable friction feed can be; and accommodates six changes, each of which can be thrown into operation instantly.

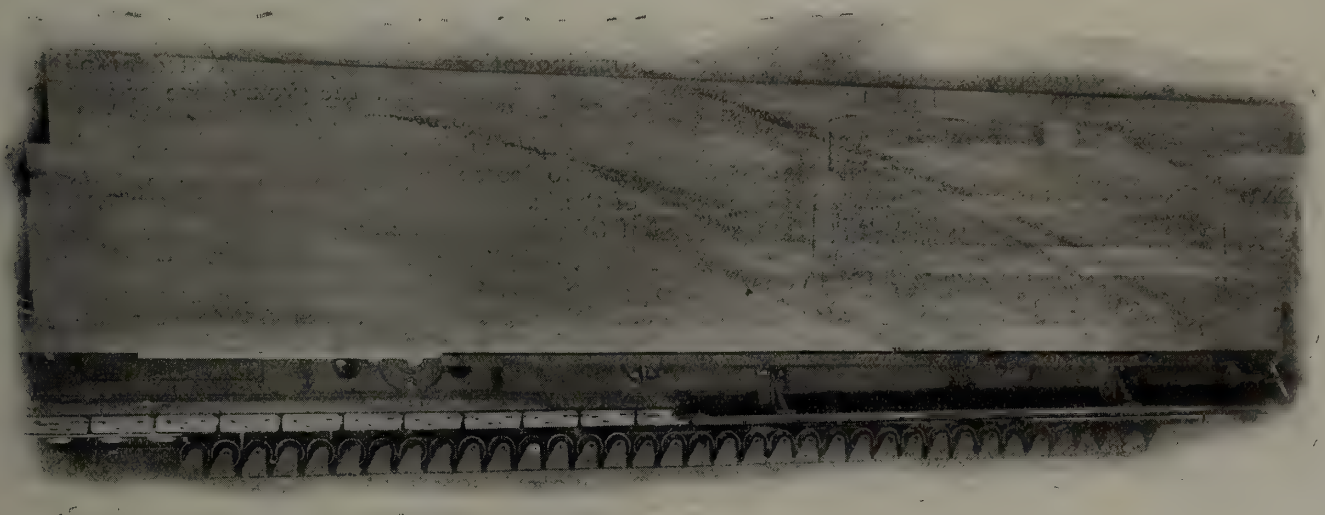
Although the illustration does not show it, the machine, if desired, can be equipped with Hess-Bright ball bearings for both the upper and lower wheels, which insure a light running tool which will accommodate ordinary babitted bearings used on band resaws regularly.

Other points of merit are mentioned in the circular, and persons interested may obtain full information by addressing the American Woodworking Machinery Company, Rochester, N.Y.

Making Narrow Lumber Wide

To anyone unacquainted with the actual working of the Linderman Automatic Dovetail Glue Jointer, the title of this article, "Making Narrow Lumber Wide," has no real significance, yet to-day there are hundreds of Linderman machines running in all parts of the world, doing this successfully, day in and day out.

The illustration shown is a panel that is thirteen feet long, forty inches wide, by two inches thick, composed entirely of two-inch elm that was as crooked and warped as could be found. This panel was put together in testing out the first fourteen foot 1911 Linderman Model built. Some of the lumber had a curvature along the edge of over one and a half inches, but with the use of the compressed air side roller pressure, the plank was forced against the gauge rigedly, holding it firmly, while the dovetail was being cut and slid into the groove of the piece coming from the opposite end of the machine. It is not the intention to give the idea that an elm panel forty inches wide, thirteen feet long, and two inches thick, built up in this manner, would be for all purposes as good as a one-piece plank, could it be procured, of this dimensions, for the reason that the curvatures which were pressed out of the lumber were too great to give positive assurance of a permanent joint, which would not open, should it be sawed into smaller pieces and given a chance to spring back into its natural shape, but it is possible, and is done every day by a large number of manufacturers, to build up panels or boards of any dimension, from narrow stock, making them better in every way, than the wide lumber.



Panel of Crooked and Warped Elm, 13′ x 40″ x 2,″ Made on Linderman Automatic Dovetailer

For box shooks, partitions, shelving, sheathing, etc., take your narrow lumber, it can be used, even if it is waney and crooked, and built up into ten, twelve, fourteen, sixteen inches, or wider boards, securing a product that is claimed to be equal to the wide lumber, and yet many dollars cheaper. On the more valuable woods, to be used in interior trim, furniture, etc., the edges of the lumber should be very nearly straight, and if the lumber be waney, it should be surfaced at least on one side, in order to break the case hardened surface to allow the pressure rolls on the machine to straighten it more easily.

Aside from the economic benefit of joining up narrow lumber into wide, there is less danger of such a composite piece checking, and it will retain its shape better, so that the product is better than the wide lumber, from every standpoint.

There is a Linderman machine built to work any desired length from three feet up to sixteen feet, and the largest machine will work down to the smallest piece, namely, eight inches in length. In the box factories where the machines are used they are working on the lowest grade lumber procurable, and in many of the furniture factories, the identically same machine is making the finest joint ever obtained in mahogany and other valuable woods.

The cost of making narrow lumber wide varies according to the different conditions. From fifty cents to $1.25 per thousand board feet, assuming that there is not more than three joints or four pieces to the foot. Even by the use of the latest improved machines, in scientifically run factories, where the cost is reduced to the lowest minimum, it is not possible to join lumber in any other manner, less than $2, and frequently it runs to double this amount per thousand board feet.

The Linderman Automatic Dovetailer is built in Woodstock, Ont., and anyone interested is invited to call and inspect the machines in operation. If readers will send samples of stock to the Canadian Linderman Company, Limited, they will be glad to joint it up, so that they can have an actual sample of their own line, joined, for criticism and testing purposes.

Fisher and Davis Company's Sawmill Machinery

The Fisher and Davis Manufacturing Company, manufacturers of general machinery, 1024 North First street, St. Louis, Mo., include among their products many machines of interest to saw mill owners. Their catalogue contains a large section devoted especially to saw mill machinery, which will appeal to lumbermen on account of the numerous practical features. In addition to saw mills the catalogue contains descriptions of their head blocks, lumber dials, steel saw mandrels, gang edgers, hand-feed edgers, trimmers, carriage feeds, live rolls, friction log turners and haulers, set works, ets., as well as their widely known and popular line of saws and saw setting and sharpening tools. The catalogue will prove most valuable to all who manufacture lumber.

The "Lightning" Line—A New Trade Publication

"The Lightning" Line is the title of a handsome new monthly publication which is being produced by the well known manufacturers of woodworking machinery, J. A. Fay & Egan Co., Cincinnati, Ohio, U.S.A.

"The Lightning" Line will be distributed free to owners and operators of woodworking machinery and will, beyond question, become a welcome monthly visitor at all up-to-date plants. In the first issue there is, in addition to the article already mentioned, an instructive article dealing with the construction of a high speed planer. Another article illustrates and describes a modern planing mill, which was erected in two weeks. A practical article entitled "How to get the best results from round cylinders with air hardened thin steel knives," is also included. From these articles it is easily seen that the publishers are intent upon producing a paper which will be of thorough practical interest to the readers, and that, in the first volume they have set themselves a high standard to maintain. That they will do so admits of no doubt, when one bears in mind the excellent record of achievement which the company have already made in connection with everything they have undertaken. The company will be glad to send this paper to any one not already receiving it, upon receipt of their request.

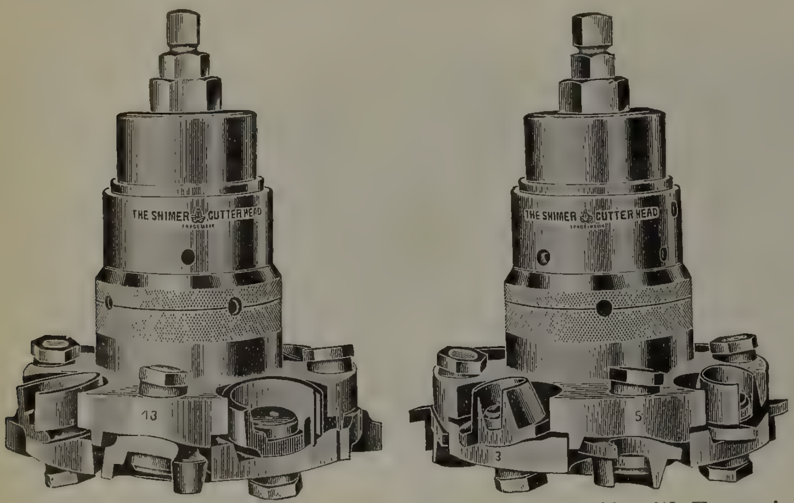
New Shimer Tools

To match flooring at the rate of 150 to 170 lineal feet per minute requires side heads of special construction. They must have great strength to stand the enormous centrifugal strains, must have a perfect balance and the bits must all do their share of the cutting.

These special points of requirements are all incorporated in the new "Shimer Limited" cutter head recently put on the market by Samuel J. Shimer & Sons, Milton, Pa. In constructing this new design of head the essential principles and vital points of the regular Shimer cutter heads have all been retained. The new head differs from the familiar patterns in the method of attaching them to the spindle; in the construction of the bit seats and of the bit designed for faster cutting; in the greater strength of the holding bolts, and especially in the self-centering device which clings to the spindle when drawn up, securing it firmly thereto.

The spindle gripping device is positive and effective in its purpose of holding fast to the spindle, as also in centering the head for a more uniform action of the cutters. This is accomplished by having the central bore of the head tapered and having a rotatable cap and nut fitted in the upper portion. Into this bore a taper collet projects, having an upper threaded portion fitting the rotatable nut. When the top nut is drawn up the collet contracts and binds itself firmly to the spindle. This device is simple and effective and one not likely to get out of order. The various parts are made of good steel forgings and the collets are hardened and ground true to size. The entire construction of this tool is the finest, both in workmanship and material.

The bit seats in these new heads carry a larger surface, and the bit chambers are of greater depth, to compensate for the new acute angle given to the bits for greater relief to the parts coming in contact with the lumber. The holding bolts have been strengthened several times over by the use of a high grade steel especially made for the purpose.



The "Shimer Limited" Cutter Heads, Figures 627 and 628, with Expansion

These heads are made either solid or with the expansion feature as may be preferred. All cutters are preferably made of high quality tool steel tempered to file. They hold an edge for any hard lumber for five hours and in many instances for a ten hours' run.

In connection with these new heads the makers have also brought out a cutter head jointing machine, which is not only suitable for the new heads, but which has been adapted to their other makes as well. This machine, with the use of files, joints the edge of the bits to bring them within a common cutting radius, so that each knife edge does an equal share of the cutting. Its careful use will improve the quality of work done and enable the operator to increase machine feeds if desired. The machine is also made with tracking attachment for setting the bits before jointing and it can be used as a filing stand for holding the heads while being sharpened with a file. The stub is ground to exact size of matcher spindles and all parts are carefully tooled, making the machine a very useful adjunct to the planing mill.

Further information and literature describing these tools will be sent upon application to Samuel J. Shimer & Sons, Milton, Pa.

Indications are that 150 million feet of lumber will be cut in the woods of the Prince Albert, Sask., district during the coming winter. The Big River Lumber Co. is the largest operator, followed by the Prince Albert Lumber Co. Small companies will also make a large cut this winter. It is estimated that between 5,000 and 6,000 men will be required in the woods to do the work of the lumber companies and the cordwood and tie contractors. It is a little early yet to determine the relation of the demand for labor to the supply, but it is certain that all comers who are willing to work can now secure employment in the woods.

Use of Douglas Fir for Piling

Long, Straight Trunk, Fits it Especially for This Use—Advantages of Chemical Treatment

Douglas fir is manufactured into almost every form known to the sawmill operator, and much round or hewed timber is used which never passes through a sawmill, says a report recently published by the U. S. Forest Service. A list of such forms and uses would represent many industries and would include piling and poles; mine timbers, railway ties, and bridge and trestle timbers; timbers for car construction; practically all kinds of lumber for houses, material for the furniture maker and boat builder; special products for cooperage, tanks, paving blocks, boxes, and pulpwood; fuel, and a long line of miscellaneous commodities including wood for distillation.

Piling is extensively employed in harbor-improvement work and in preparing foundations in soft ground for bridges, trestles, and other heavy structures. The long, straight, slightly tapering trunk of Douglas fir fits it for this use, and it is strong, resilient, and fairly durable. It has no important competitor as a pile timber in the western part of the United States, and is used almost exclusively for marine and railroad work on the Pacific coast. The wood is sufficiently hard to penetrate readily most soils, and it acts well under the hammer. It is occasionally necessary to band the tops of piles to prevent brooming and splitting, but bands are used only where hard subsoils must be penetrated.

Untreated Douglas fir piling is fairly durable, though its durability will vary, of course, according to the place where it is used. West of the Cascade Mountains, in trestle construction, the average life of the untreated pile is about 8 years; east of the Cascades, when not affected by alkali, it is expected to last 10 years; but an alkaline soil or sitpation may cut its period of usefulness to 6 years. The first indications of decay in untreated fir piling are usually seen about 3 inches below the ground line or just under the cap. When the piling is to be creosoted it is best to wind 6 or 8 feet of the top of the pile with 15 or 20 turns of telegraph wire, and to put on a ring to lessen its tendency to split and shatter under the impact of the hammer. The sapwood contains most of the preservative, and if this is split in driving the effect of the treatment is in part nullified. In driving creosote piles the best results are obtained with a steam instead of a drop hammer, as there is less likelihood of shattering the stick and thereby opening seams through the casing of treated wood to the untreated interior.

Untreated piling lasts from 3 years to 6 years on the California coast. The teredo and other marine borers attack it, as they do nearly all timbers exposed in salt water. On Puget Sound, piling has been destroyed by marine borers in 6 months. When intended for permanent work, fir piling should always be treated with a preservative to repel marine borers, or it should be protected in some other way against attacks. Creosoted Douglas fir piling has remained sound for 20 years in salt water on the Pacific coast. Fir piles find wide use as far east as the Mississippi River. A set of standard specifications for fir piling follows, in order to show the requirements for this use is as follows:—

Piles must be straight with not more than 1 inch deviation per 10-foot length of pile from a true line drawn from butt to tip; for instance, a pile 60 feet long can deviate 7 inches from a straight line drawn from butt to tip.

They must be stripped of bark and be not less than 9 inches diameter at the tip or small end. At the butt they must be not less than 13 inches nor more than 17 inches diameter.

They must be sound, free from large knots, wind shakes, felling checks, rot, or other defects.

All limbs and knots must be cut flush.

All piling is subject to inspection at point of delivery.

Railroad and telegraph companies use a limited number of Douglas fir poles in regions where this timber is cut. Usually the poles are logged from forest land where clean cutting is practiced, but occasionally second-growth stands are logged for poles alone. The young tree's long, tapering trunk gives it an admirable form for this use, but it can not compete with the abundant and more durable western red cedar, and to that fact is due the limited use of Douglas fir for poles in regions where the cedar may be had. Its use for poles is restricted chiefly to country telephone and telegraph lines and to lines for carrying block-signal wires, in regions where the cedar is more difficult to obtain. As the supply of cedar poles diminishes, and a satisfactory but preservative treatment is developed for Douglas fir, it may be substituted for cedar. Large and attractive sawed poles of fir are in use on many electric car lines in cities where utility and handsome appearance are combined. Some of the street car lines in the vicinity of Washington, D.C., are equipped with Douglas fir poles.

Changing Conditions in Sawmills

Necessity for Keeping Abreast of the Times—Mechanical Apparatus Continually Being Improved

By J. Crow Taylor

There are some wonderful changes going on and in prospect in the mechanical conditions around the average sawmills, so that a man fairly conversant with sawmilling a few years ago will be out of date in a few years more unless he keeps step with the changes and takes into consideration the conditions that bring them about.

It is not merely changes in the mill proper in the way of more up-to-date equipment and finer manipulation and electric transmission that are in progress, though these do come first in many instances, and are very important, as they make for a higher order of mechanics all round. But, in addition to these there are other changes that will come in the way of side lines or extra institutions surrounding the sawmill for the purpose of working up material that heretofore has been going to waste. In short, it looks like the average sawmill may soon become merely a nucleus about which will gather various manufacturing institutions and that the old days of haphazard sawmilling will almost entirely disappear and be replaced with modern manufacturing institutions calculated to do something near what it is claimed the French are already doing, and that is, utilize all of the tree but the wind that blows through the leaves.

Waste Material Utilized

It is not only side institutions for manufacturing small dimension stock and special wooden articles in small size from offal, and from slabs, from culls and from short lengths of timber that heretofore has been left in the woods, but to all the multitude of these comes also the development of ideas along the line of converting waste into various side products, or by-products, we might better say. The making of turpentine, wood alcohol, and various other chemicals from all manner of refuse that can not be worked into wooden articles. Some of the dreams connected with these include not only rendering out stumps and sawdust, but also even the limbs and the leaves.

It all reminds one a little of what has happened in connection with the cotton industries. It is well known there was a time not so long ago when cotton ginning was a simple operation and cotton seeds were a burden, while to-day though cotton ginning is still a comparatively simple operation, the seeds, instead of being a burden, furnish the material for an enormous industry, and the product is considered among the valuable acquisitions of the country. We may not go quite as far as all that with the timber working industry, and yet it is no more impossible nor impracticable when measured up theoretically to have that part of the timber which has been going to waste, become fully as valuable, comparatively, as that part of the cotton crop which in the early days went to waste, and is now a conspicuous feature of the cotton industry.

The Sawmill of the Future

The main idea here, however, is not to theorize so much as to point to what is coming and stir up a little awakening as to what it may mean in the way of changed conditions from a mechanical standpoint. It means getting the mechanics of the sawmill and its subsidiary institutions not only down to a finer point scientifically, but spreading out to an infiintely wider scope, and must include many things not dreamed of in the earlier days of sawmilling.

Generally, the first thing to get attention is the equipment of side institutions for working up a part of the offal of the lumber product into something saleable, and to refine low grade lumber so as to make it worth more and save the burden of freight on waste material. All of these things are not mere theory any more. They have been put into practice and it means the taking in by sawmills, lots of the lighter machinery and also the need of skilled operators for handling this machinery.

Special Training Required

Operators will be trained somewhat differently from the usual training in sawmill work. It is about the same difference as that between training for handling lumber proper and handling shingles and other light products. Though the operators and their training really come afterwards, and the first problem that confronts those who have to attend to the mechanical affairs in sawmilling is that of selecting machinery and laying out plans and putting it up so as to accomplish the work of refining cull lumber and working up odds and ends in the most economic and practical monner. They are problems, too, that though they may look simple, really involve a lot of study and experiment. And there is probably nothing that the average millwright or mechanical man working among the sawmills can give attention to with the promise of better results than that of planning such institutions. There will be involved, of course, many different products and different conditions, and what is needed is such a thorough grasp of the situation under all varying conditions that a man can take any given mill and its product and plan out a side institution that will give the best results in the way of handling the offal and culls and converting them into the most saleable product. In some places there may be need for veneer machinery to mix in with the lot; at other places simply a combination of ripsaws and cross-cuts to refine certain culls. At other places, there may be need for making slack barrel staves and pail staves. Some may call for one thing and some another. Here and there it may be advisable to install machines for club spokes, for getting out hickory handle billets, or for making various things in the way of scall dimension material and hardwood. And altogether there is a chance to include as a part of the different sawmills some feature of practically every branch of woodworking. This opens up practically an unlimited scope for study and work, and what is needed and will be well paid for when it is once established, is men with the knowledge and ability to comprehend any given situation and suggest a machinery equipment that will best utilize the timber resources, then lay out the institution and put it to work successfully.

Improved Machinery Needed

It is not meant that those having charge of the mechanical operations of the sawmill itself should neglect their calling, for instead of being neglected there will be need for even finer manipulation among the mills. Both saws and carriages must do better work. It is not a matter of quantity, but of getting quality of manufacture and getting the most out of a thousand feet of logs. There will not be the same call for rushing things, but there will be need of better workmanship all the time, both in the sawmill and in the planing mill, with probably the greatest stress for refinement laid on the planing mill. There are some planing mill plants where the work of refining cull lumber and working up scraps and things of that kind may be easily carried on as part of the planing mill work with the addition of a machine or two here and there just as in the past they have put in lath machines and things of that kind, only the scope will be somewhat widened.

Small Mills Interested

It is among the smaller mills, however, where seemingly there is room for extensive development in these side issues, the mills that heretofore have not thought of doing anything much, but just sawing logs into lumber. This sawing of logs into lumber and leaving slabs and cull timber and cull lumber at the mills going to waste and leaving in the woods tree tops, large limbs, and things of that kind, that seemed worthless under the old regime, will soon be a thing of the past, and to get a proper return for stumpage even the small mills must plan to clean up the tree closer. Some will need portable equipments here and there that can be taken about in the woods to work up the short lengths, some will need equipments that, though a part of the sawmill itself, will not make it too burdensome to move from time to time, while in some cases the addition of an equipment will enable the sawmills to take on more permanency itself and get its logs over a longer haul. But whatever form it takes, there is coming as a part of nearly every modern sawmill equipment some means for converting timber that in the past has been going to waste. And what it means in the way of enlarged and altered mechanical conditions is a whole lot.

There will come as special features the distillation of waste wood products involving a certain amount of chemistry and scientific study, and mechanical problems not common to the average sawmill or woodworking institution, and incidentally there may be involved eventually the conversion of lots of wood waste into pulp and from that into paper. The ideal thing if it can ever be attained right is to distill and render out the saps and chemicals and then take the residue of distillation and convert it into pulp.

Also, in addition to all these things there is entering as another scientific problem that practice developed somewhere recently of treating lumber to prevent stain. This matter, though comparatively simple, involves some changes in the mechanical surroundings that must be taken into consideration in the sawmill equipment. There is no question but what an enormous lot of good lumber has gone to waste in years gone by through sap staining and rotting. And it is about the worst form of waste imaginable to cut down good timber, convert it into lumber, pile it up on the yard, and then let it go to waste through rotting. This kind of waste is too flagrant to be continued, and if dipping into some solution will check the rot, the dipping should be become general in the next two or three years, and some mechanical means for handling lumber through dipping vats should form a part of even the smallest and simplest milling operations.—The Lumber Trade Journal.

The planing mills of Robert Conkle at South Clinton, Ont., were completely destroyed by fire recently. The loss amounted to $10,000.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Want To Buy

Wood, Slabs and Edgings; any quality. Fizette, 265 Davenport Road, Toronto, Ont. 22-22

Wanted

Ten cars 2-in. Log Run Maple. State best price for cash. Box 330, Canada Lumberman, Toronto, Ont. 18-23

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

Spruce Wanted

We can use short spruce 4-4 and 5-4. Describe what you have to offer and lowest price delivered here. The Rathbun Company, Deseronto, Ont. 21-24

Wanted

I have a Newfoundland limit for sale about one hundred square miles, well watered and close to railway; price moderate; chiefly spruce and pine. Write B. T. R., care Canada Lumberman, B34 Board of Trade Bldg., Montreal, Que. 22-1

WANTED—Block of hardwood lands within reasonable distance from transportation, give full details with map and lowest cash price. Box 325, Canada Lumberman, Toronto, Ont. 22-22

At a recent meeting of the B. C. Tax Commission held in Fernie, interesting evidence was presented by Manager Duboise, of the Elk Lumber Company. Mr. Duboise presented startling figures about the large amount of United States lumber which had been sold in the prairie provinces during the past season and suggested that some relief might be afforded by a reduction of the taxes levied upon lumber.

Mr. Miller, of Miller & Seim, lumber dealers, Hampden, Ont., was a welcome visitor recently at the offices of the Canada Lumberman and Woodworker.

HAMILTON, ONTARIO

Review of Current Trade Conditions

Ontario

The market for pine and for hemlock in Ontario shows little or no alteration. Prices as a rule are stiffer. Conditions however, are not what could accurately be called normal, as the retailers throughout the province are playing safe. Travellers who have visited Ontario retailers recently, find them in a very conservative frame of mind. The cause of this is generally set down to the small crop which Ontario farmers have harvested this year.

Norway pine is quite stiff, in fact it is one of the best commodities on the market to-day. A year or two ago stocks of Norway pine were very plentiful and prices had been good for some time. The result was a heavy overproduction and a bad break in prices. Since then manufacturers have not been producing Norway to anything like their ordinary extent. This has gradually brought about a decided improvement and to-day good prices prevail, while there is a shortage of stock. The spruce market is quiet and featureless. Shingles also are unchanged. There is an excellent demand for lath and some of the grades are rather scarce. The shortage is most noticeable in No. 2 and 3 white and red pine. No. 1 white and red pine is plentiful.

A number of representatives of Western Canada mills who were recently in Ottawa complain bitterly of conditions in the West. They reported that prices are bad and that competition from the other side of the boundary is unusually keen. To account for this condition they stated that so much timber had been burned in Wisconsin and Idaho of late, that it had been forced on the market and in order to save the timber sacrificed prices had been accepted.

The lumber trade at Ottawa has been in a much more satisfactory condition during the last month than during any previous part of the season. The settlement of the election uncertainties gave a decided fillip to business. Actual buying commenced after the elections on a much more extensive scale than before and has kept up well ever since. The most promising feature is the improvement in the demand for the lower grades. Ottawa producers have found a good market both in western and eastern Ontario for the lower grades. The trade in the United States has also improved and retailers across the line are reported to be well cleaned up, so that they have to buy for their immediate requirements. This keeps up a good steady trade. Ottawa Valley manufacturers are reported to be practically cleared out of the cheaper grades.

Eastern Canada

The lumber trade at Montreal continues active and fairly satisfactory, although from some quarters there is complaint of a slight falling off in volume. The building activity continues in an encouraging manner and real estate transactions indicate that the extensive building operations of the past summer will at least be equalled next year. Many of the retail lumber dealers in Montreal report that October was the best month they had had for some years.

Good prices are being secured for the lower grades of lumber. The scarcity of lath continues and prices are firm. A good grade is reported in hardwoods and prices are stiff. Birch and maple are rather scarce. There is not much of a demand for dimension timber at present and it is not thought that the demand will increase until the Government comes actively into the market. A slight improvement is reported in hemlock. Shipments to Great Britain are heavy, on account of the approaching close of navigation. The car scarcity continues.

There is a good demand for spruce for the United States, although the small stuff is not quite so active. Stocks of spruce along the Ottawa river are pretty well cleared. Lack of water power has interfered with the production of ground wood, in Quebec Province. Chemical wood is in good demand and scarce, and prices have risen.

The market for eastern spruce at Boston continues fairly firm. The retail yards have been enjoying a good volume of business but are unwilling to lay in stocks ahead. Frames 9 inch and under are bringing $23.50, but some buyers assert that stocks have been offered to them at less. Some of the manufacturers are holding firmly at $24, but are reported to be doing very little business. There has been a fair volume of business in the random market, with the asking prices varying about $1.

At New York, orders for eastern spruce are more numerous but the prices show no improvement. Fairly good stocks are held by the yards. Mill stocks are held firmly and manufacturers express satisfaction with price conditions.

The New York market for hemlock is quiet, but prices are firm. Stocks at mill points are reported low for this season of the year. The country trade is fair but yards are buying only for their immediate requirements.

At Boston, a firmer and higher market for eastern boards has materialized. Sales of clipped boards have recently been made at $19.50 and one manufacturer has been asking $20. Offerings of stock are light and no immediate increase is expected.

Shingles at Boston are in fair demand. A few of the choice brands of extras are held at $3.60 but few sales are made at more than $3.50, while some lots are selling at $3.40. Clears are offered at $3.10 to $3.20. A moderate demand for lath continues with prices for 1⅝-inch ranging from $4 to $4.15, while 1½-inch bring from $3.45 to $3.50. Few sales are reported at the top prices.

Great Britain

There still continues to be a much more optimistic opinion in London regarding the outlook of the winter trade in lumber. Batten sizes are quite strong. Floorings have improved considerably and stocks are reported rather light, especially in the standard widths. It is quite possible that another advance will be made before the end of the year. Deal sizes are being held firmly. For the week ending October 21 the London deliveries amounted to 5,612 loads, as compared with 7,476 for the corresponding week of 1910.

At Churchill & Sim's recent auction sale, prime unsorted Oregon 6 x 12/20 inches sold at 1s. 8d. and 1s. 5d. and 4 x 16 brought 1s. 6d.; three-inch only brought 1s. 3d. Some 3 x 8/16, 6 to 18 feet brought £9. A lot of 2½ and 3 x 7, 6/20 brought £8 5s. For 3 and 4 x 5 and 6, 10/19, and 2½ x 5 and 6, 10/19. The price secured was £7 5s. Another lot of pine, 3 x 11, 12/14 sold at £10 5s. and some 11/13 brought £10. In pine a shipment from Quebec of 3 x 10/20, 5/9 sold at £10 and 3 x 7 and 8, 4/9 sold at £9 5s. A lot of 3 x 6/12, 5/16 spruce from St. John was sold at £6 10s.

No improvement can be reported in the Liverpool timber market. Shippers of hardwood from the Southern States to Liverpool are sending over extensive stocks and taking whatever they can get for them, as a result of the unsatisfactory trade in the United States. This is one of the chief causes of the dullness in Liverpool trade. A slight improvement is noticed in the spruce deal market for New Brunswick and Nova Scotia shipments. This is expected to continue until the close of the season. Montreal shipments are now nearing their end and under these conditions there is no possibility of pine of any description falling below its present prices.

Liverpool prices for the spruce spot market have been improving slowly. The wide variety of shipments however, is retarding the movement. For Miramichi or St. John deals, prices have been raised slightly. At present however, the demand seems to have fallen off and a number of consumers taking advantage of the decline have laid in sufficient stocks for the time being. This is not a very pleasant situation for the importers. It is considered certain that at the end of the year stocks will show a material decrease and that a scarcity is likely to develop before the commencement of the next season.

Liverpool stocks of hemlock are rather large, but the indications are that the demand will continue good for some time, as a result of increased prices for spruce. Birch is steady on the spot market and stocks of logs are gradually declining. Planks are in short supply.

Manchester trade is reported to be quite encouraging. The advanced prices which have recently come into force seem to have persuaded merchants that the cut-throat competition of recent months has come to an end. Practically all of the timber using industries are working all on full time. Builders and contractors are unusually busy for this time of year. The railway companies are buying extensively. Prices generally are in favor of holders. Stocks of spruce and in fact of most wood goods are fairly light and in strong demand.

United States

The United States lumber trade in general shows but little alteration and is apparently on a current consumption basis, with stocks at the mills and in the dealer's hands quite sufficient for immediate requirements. There has been however, in the New England States a moderate improvement in the dmand, which has been felt especially by those who handle Canadian products. Dealers at Ottawa and Montreal report an encouraging improvement during the past month. The trade along the Ontario border has however, continued to be only of a hand-to-mouth nature. Retail dealers, at North Tonawanda for instance are not ordering white pine in excess of their immediate requirements and any carrying of future stocks is left to the wholesalers. In spite of this a moderate in-

crease of enquiries is reported, although no strength has been added to the market. The general consumption of lumber at Buffalo is fair.

Chicago:—The city demand continues active, with a fairly large enquiry from the country. Excellent weather conditions have encouraged building operations, and the prospect is that the present volume of trade will continue during most of the winter. There is a fairly satisfactory demand for northern pine and prices for all grades are firm. Extensive purchases have been made by the box and crating trades and stocks of No. 4 and No. 5 boards are quite low. The hardwood situation continues satisfactory, with a fairly large quantity of business. The volume of business is greater than at this time last year and also greater than it has been during the few previous weeks. Hardwood prices are stiffening slightly, and the lower grades are in better demand. Plain red oak in firsts, seconds and common, is strong and the demand is good. There is a moderate demand for white ash. Basswood is dull. A good demand and firm prices prevail for unselected birch, in firsts, seconds and number one common. A good enquiry is noted for hemlock and prices are steady. The demand in the city has been good throughout the season. Country trade is fair. Stocks at mill points are rather badly broken and a smaller input is expected this winter than last, so that better prices are rather to be expected. Southern pine prices are being firmly held on timbers and factory flooring, and it is not unlikely that slight advances may occur a little later on. Wholesalers expect improved conditions about the first of the year. Shingles and lath remain about stationary, although orders show a slight increase. Clears are selling at $2.95 to $2.97 and stars have been bringing $2.45. Lath continues strong. The cooperage situation continues changeable.

Buffalo:—The local trade in northern pine is slightly increased. Prices, however, are not strong for building lumber and cheaper grades, competition being very active. The customary scarcity of upper grades continues, and prices remain firm. The box business is fairly active, some of the large factories being busier than they were a year ago. Hardwoods show a slight improvement but no real increase in activity. The best demand is for the better grades of maple and birch, both of which are scarce. Beech flooring is being used considerably. The demand for plain oak is about as usual at this time of year, and the price is firm. Building activity has improved the demand in hemlock. Yards are carrying fair stocks, and prices have not shown much change recently, as competition has kept them low. A moderate improvement is shown in the fir trade, although it is not so active as dealers expect. Spruce continues quiet. Shortleaf pine trade is fair and prices are firm. Red cedar shingles are dull and prices are low. The market is well supplied.

Bay City and Saginaw:—The trade in northern pine is fair compared with a year ago. The prices of the lower grades continue steady, and there is a good enquiry. A large quantity of lumber is being taken by the box trade, but prices are rather low. The sash and door trade is fairly active, and building operations are extensive. Prices generally are fairly steady.

Opposition to Pacific Coast Merger

The proposed merger of most of the important sawmilling companies of the Pacific Coast of the United States, although making good progress, is meeting with considerable criticism. This criticism is not confined to those outside of the lumber industry, as is evidenced by a note of warning sounded by E. G. Griggs, of Tacoma, Washington, president of the West Coast Lumber Manufacturers' Association, and of the National Lumber Manufacturers' Association. At a recent meeting of the West Coast Lumber Manufacturers' Association Mr. Griggs declared that the amalgamation of enormous capital in the lumber business would not be a panacea for the troubles now besetting the trade. "Any trust proposition is not the right way to remedy conditions nor is it the quick and effective method," said Mr. Griggs. "We have the brains necessary to remedy the situation ourselves. If we would confer more; get together often to discuss conditions; cut down the production in two months we can commence to feel the benefit of curtailment. We must not run our mills at nights as a few manufacturers persist in doing." At the meeting at which Mr. Griggs spoke in this manner, a resolution was adopted proposing a shut-down for 30 days of all lumber mills, in Oregon and Washington, commencing December 15, so as to enable plants to be overhauled and at the same time to reduce the supply of lumber. It is reported that the curtailment movement which was inaugurated a few months ago has already resulted in taking approximately 334,000,000 feet of lumber off the market.

The bulk of the import from Canada into the Argentine is of timber, spruce, white and pitch pine in the order mentioned.

Market Correspondence

Ottawa Lumber Trade Greatly Improved

Ottawa, November 9.—The lumber manufacturers report business very much better during the past month than at any other time this season. Since the elections, business has steadied down, as far as the American market is concerned, and there is much more actual buying.

A noticeable feature is the strong tendency in the prices of the lower grades. The Western Ontario market has been particularly good for the past few months, for the Ottawa Valley producers. The eastern market is also very fair, and accordingly what might be termed the local consumption, has been heavy, as this falls more particularly on the lower grades, it is to a large extent responsible for the increased activity. The American market is better than it has been for some time, much better than at this time last year. Last year the American retail firms were well stocked up, and therefore there was no reason for buying. now, however, the smaller companies on the other side of the line have sold out fairly well, and must buy for their trade. While they are just buying as they need, and not stocking up by any means, still, this furnishes a pretty brisk demand.

It is claimed that the manufacturers of the Ottawa Valley are practically cleared out of the cheaper grades, mill culls and box lumber. They sold out at from $15 to $16 for sidings and stocks, while strips went from $13 to $14. While, of course, the lumber has not yet been moved away, there is scarcely a firm in the Ottawa Valley which has not sold out its supply of these grades.

A number of the mills have closed down. Among those still running are John R. Booth, W. C. Edwards Company, Gilmour & Hughson, Shepard & Morse, the Colonial, and R. and T. Ritchie. The other firms, for the most part, closed down for lack of logs. In the case of the Hawkesbury Lumber Company the water was so low that it interferred with operations.

The water in the Ottawa is much higher, having been rising almost continually for some weeks past. It went up some four inches in a few days. This allows much more vigorous work at the Chaudier.

Wages remain steady for men for the shanties. Prices range up to $32 a month with board and transportation. There is not as great a scarcity as last month. It is stated that the operations in the woods will be greatly reduced this winter. It is estimated that 800,000 less pieces will be put into the Ottawa river next spring than last spring. Notwithstanding this it is believed that next summer's cut will be larger than any summer in the past, under normal conditions. There is so great a surplus of logs in the river, that the reduction in the number of logs cut in the woods this winter will not be felt at the mills. There is little or no change in the cost of operations in the woods.

The Bronson Company has taken out a permit to erect a pulp mill to cost $30,000 at the Chaudier. Work has already been started on it.

The planing mills are having a good trade in this city. Not only are there more small houses being erected now than at any other time this season, but there is also a heavy demand from the country. The general prosperity of the farmers is evidenced in improving their buildings.

Activity Continues at Montreal

Montreal, Nov. 10.—There has not been much change in conditions since the last report. Inquiries indicate that business is good—"very good," said one wholesaler—but occasionally there is a complaint that things have slackened off a little. The general feeling, however, is that there is likely to be a continuance of satisfactory trade, making, of course, due allowance for the dullness which occurs in the winter. There have lately been large transactions in real estate at increasing prices, and apparently everything points to the building boom being resumed next spring. This will mean an appreciable consumption of lumber, and a consequent renewal of the excellent times which local dealers have already experienced. Some of them report that October was the best month they had for years.

The cheaper descriptions of lumber are very stiff in price, and will probably still further advance. Lath continues scarce and firm owing to the Ottawa mills closing down early. In hardwoods, trade is good with quotations likely to rise; there is however, a scarcity of birch and maple. Dimension timber is still in poor request, and until the Government comes to some decision as to contracts is likely to remain in this position. Hemlock has picked up a trifle.

ecuting fresh orders, but in trying to get their lumber away before the close of navigation.

General complaints are heard of the scarcity of cars, especially by those wishing to rush lumber before the higher rates come into force on November 15 at competitive points. A prominent firm was short of four hundred cars, and in a second case an order was not executed for six weeks. So badly off are the railways that in one instance where goods were consigned to a point on another line the officials, in order to get the cars, wanted to tranship into the cars of the second company, although the goods had been booked on a through rate.

A good demand for spruce, except for small stuff, is in evidence for the United States. Lately the iqnuiries have been more frequent, and as navigation neared its close, all the available barges were chartered. A considerable amount of lumber was left over owing to this difficulty of obtaining transportation; on account of the New York State canals closing on November 15th, barges could not load after November 4th. Although stocks were well cleared along the Ottawa River, there were still a good deal to go by the Williams' line, which closes on November 15th.

With regard to the pulp situation, water power conditions in the Province of Quebec are still disappointing and in consequence the production of ground wood has been curtailed. There does not appear to be any material on hand or any to be purchased for immediate shipment. One of the largest mills in the country has sold its entire output for next year. On the subject of the tariff the head of a prominent firm referred to President Taft's speech to the Fox River paper-makers, when he said that section 2 of the tariff would remain, and that the question of allowing European pulp and paper to go into the U. S. free under the favored nation clause was a matter he and the state department would take up when he returned to Washington. "If," said the gentleman spoken to, "the U. S. allow European products to go in free under this clause it will be discrimination against Canada, as freedom from duty is only extended to pulp and paper manufactured from wood cut on private lands in Canada, all other products paying full duty." Chemical pulp continues a strong market and prices have again advanced owing to scarcity.

Wrapping and manilla papers are still low in price in Canada, but with a good demand there are hopes that quotations will be put on a more remunerative basis. In news descriptions the mills have been exceedingly busy, but the low water power at some points has made running difficult; any buyer not protected in his supply finds it hard work to get immediate shipment. Prices have advanced for home consumption. In 49 mills reporting to the Government at Washington on the first of October the production for September showed 1,000 tons more than in the previous month, the quantity on hand decreasing by 5,466 tons. At the end of September the quantity on hand was 48,120 tons.

Nine Months Timber Import

The sawn timber imported into Great Britain during the first nine months of this year is less than during the corresponding period of 1910 by 357,000 loads, and that the total value of the whole import of the nine months of this year is approaching a million pounds less. The following analysis of the imports to the end of September compared with the corresponding period of last year gives the position with regard to the most important descriptions of goods:—

	Quantity Loads	Value £
Hewn	* 36,051	x 55,011
Pitprops	* 162,345	* 137,713
Sawn	* 357,731	* 986,113
Staves	x 537	x 49,474
Mahogany (tons)	x 12,556	x 122,620
Unenumerated (tons)	* 3,051	x 46,218

x Increase; * Decrease.

B. C. Log Supplies Unusually Large

As the British Columbia logging operations for the season of 1911 draw towards a close, Provincial Timber Inspector G. D. McKay finds, by figures secured by his officers, that the sawmills and logging camps of the coast of British Columbia, which includes both Vancouver Island and the lower mainland, have a total store of 250,000,000 feet, log measure, of logs. This amount is far in advance of any winter's store of logs in British Columbia since 1907, which was the record year of the province. The year's output of logs for the province is under one billion feet. The amount then of logs stored for winter milling about twenty-five per cent. of the entire year's output.

"It is necessary for the mills," said Mr. McKay to-day, "to have on hand at all times a large supply of logs. This is due to the uncertainty of an even log supply. During the winter months, November, December and January, the loggers can not work more than half the time. The mills, however, are running full handed and require the raw material just the same as usual. In order to meet this constant demand it is necessary to have a large supply of logs on hand at all times, more particularly, however, in the winter."

Owen Sound's Great Lumber Industries

An excellent booklet entitled "Owen Sound On-the-Georgian-Bay, Canada," has been published by the department of publicity of that town. The booklet is profusely illustrated with views of the town and of various features of the lumbering industry of Georgian Bay, from which Owen Sound draws a large measure of its prosperity. The booklet was prepared especially for the recent visit of the Hoo-Hoo to Owen Sound, and for this reason special reference is made to the lumbering industry. A chapter devoted to this subject states that the quantity of lumber, lath and shingles cut during the season of 1910 on Georgian Bay was 478,871,000 feet, this including, of course, the North Channel to Sault Ste. Marie, the Canadian shore of Lake Huron, and all mills tributary to Owen Sound by water haul. The cut of lath for the same district totalled 162,330,000, and the cut of shingles, 15,286,000.

"A cursory glance over the map of Ontario shows forcibly," says the booklet, "why the Georgian Bay district holds so great an attraction for the lumberman and woodenware maker." Tributary to its waters are the uncut forests of the north, east and west. In five hundred years these forests, standing as they do now and with treble the ratio of this year's cutting, will not be depleted. The Georgian Bay resources for the lumberman are inexhaustible, for the policy of both the Dominion and Provincial Governments is to husband our natural resources, and preparations are now under way to preserve for all time to come a timber supply in the region mentioned. Sixty per cent. of the timber along the Georgian Bay is pine; the balance is maple, birch, basswood, ash, soft and rock elm, beech, etc.

"The facilities for supply, for manufacturing, for selling and for shipping these wooden articles cannot be surpassed, and the manufacturers of Owen Sound, knowing the great market demand assured of the ease in the handling and distributing, say to the woodenware-makers-of-the-world, 'Come, we have more than we can handle; combine with us to make Owen Sound the biggest woodenware manufactory of America.'"

Reports from Seattle, Washington, are to the effect that the lumber trade is showing encouraging improvement. Stocks of lumber, at Oregon and Washington mills are now below normal. A large percentage of the lumbermen are now shipping direct from the saw.

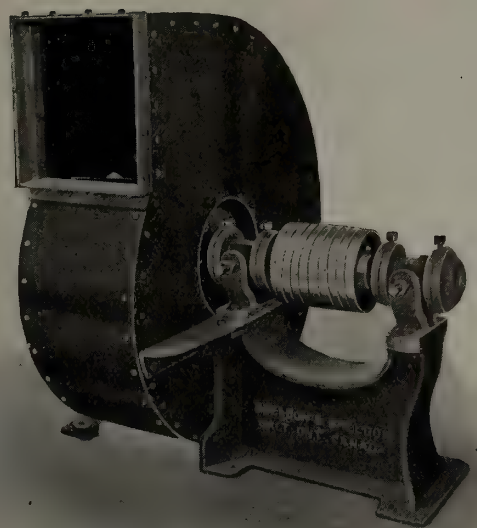
Colorado Ranger Course

The Colorado School of Forestry conducts a "Ranger Course," which will open this year on December 13th and continue for ten weeks. The course is specially arranged for the benefit of rangers, guards and others engaged in forest work who desire to increase their efficiency, for those who wish to prepare for such work and for cruisers, logging superintendents, timberland owners, and others who wish to acquire a knowledge of the general principles of ferestry. Those wishing to attend should address the Director, P. T. Coolidge, Colorado School of Forestry, Colorado Springs, Colo., not later than December 9th.

Assistant Secretary Curtis of the United States Treasury Department is preparing a ruling to clear up the status of wood pulp and paper made from wood cut on Crown lands in Canada, which has actually escaped payment of any tax, although theoretically subject thereto under Canadian law. It has been claimed by importers of paper that, if the tax has not actually been paid, the pulp and paper are not subject to duty while if it has been paid they would be. Domestic paper interests take the view that, whether the wood did or did not actually pay the tax, the paper made from it should pay duty at a higher rate, provided the wood was theoretically subject to duty. In some provinces a considerable amount of wood is affected, which was cut prior to the date when the tax went into effect, and this, it is supposed, will be covered under Curtis' new ruling.

Great Britain's imports of wood and timber for the first nine months of 1911 were valued at £18,880,008 as compared with £9,730,511 for the corresponding period of 1910 and £17,025,268 for the corresponding period of 1909. These figures are on a c.i.f. basis.

Sheldon Slow Speed Exhaust Fans



The fans that are revolutionizing the shaving exhaust business. They will handle wet or dry, long or short shavings and sawdust, and will do this work with a guaranteed reduction in speed of from 25 to 40% less, and with a power consumption of from 20 to 35% less than any other exhaust fan.

Timber Estimates

With increasing values in timber land, accuracy in estimates of standing timber is all important. We are practical foresters and make all estimates according to the most approved methods, assuring the smallest margin of error. We furnish forest maps showing the character and location of timber and the average stand in each, as well as the topography; also the blocking of townships in one mile blocks, a most necessary piece of work in the economic operating of timber lands.

A Large Paper Company's Opinion of Our Work

Great Northern Paper Company,
Spruce Wood Department.

Bangor, Maine, Dec. 24, 1909.

Dear Sirs,—

Your work in blocking and estimating of approximately forty thousand acres, owned by the Great Northern Paper Company, this summer, was most satisfactory. The results of such work are unquestionably of value to us in handling timber lands.

Very truly yours,
F. A. GILBERT.

We survey wild lands for the renewal of lines to prevent encroachment and to get actual acreage, the old surveys often being faulty.

We appraise for present and future worth—of particular importance to Bond and Banking Houses in connection with purchases and sales.

Our Booklet F, "Applied Forestry," will prove of interest. Mailed upon request.

We are pleased to refer you to the Great Northern Paper Company, Bangor, Maine; H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

EDGINGS

Ontario

A. Fisher & Son, Paisley, Ont., is advertising his grist and saw mill business for sale.

Joseph Collard's saw mill at Gormley, Ont., was recently destroyed by fire.

The headquarters of the DeLaplante Lumber Company, Limited, manufacturers and wholesale lumber dealers, has been transferred from Toronto to Tomiko, Ont.

The Mount Joy Lumber Company, Limited, Toronto, has been incorporated with a capital of $100,000. The provisional directors are G. A. Grover and D. W. O'Sullivan, both of Toronto.

Lewis Cann, saw miller, East Luther, Ont., is reported to have assigned to John M. Kearns.

Coquitlam Lumber Company, Limited, Coquitlam, B.C., has been incorporated with a capital of $10,000.

The Lumbermen's Trust Company, Limited, Vancouver, B.C., has been incorporated with a capital of $1,000,000.

The Alberta British Columbia Lumber Company, Limited, Cranbrook, B.C., has been incorporated with a capital of $500,000.

The plant of the Thomas Pink Company, Limited, Pembroke, Ont., manufacturers of lumbering tools, was almost entirely destroyed by fire at an early hour on November 2. The loss will be in the neighborhood of $35,000, and is fully covered by insurance.

Grant, Holden, Graham, Limited, Ottawa, Ont., have been incorporated with a capital of $100,000 to manufacture and deal in lumbermen's and railroad contractors' supplies, &c. The incorporators include Hugh Grant, S. S. Holden and G. Murray, all of Ottawa.

It was reported at Thorold, Ont., that a million dollar pulp and paper mill is soon to be located there. The entire output will be shipped to the States to be used at paper mills there. The plant will probably occupy several acres near Lock 25 on the new canals.

The Wilson Lumber Company, 1 Spadina avenue, Toronto, will erect a factory costing $3,000 on the south side of Lake street. The contract for the building has already been let. It will be of frame construction with brick foundation, and will be covered with galvanized iron with tar and gravel roof.

Windsor, Ont., has carried a by-law to assist the A. E. White Machine Works, of Eau Claire, Wis., who are establishing a $6,000 factory at Windsor, for the production of sawmill machinery. The building is to be one storey, of steel and concrete, 100 x 30 feet. The company manufacture filing room specialties.

The Avey O'Laughlin Lumber Company, Brantford, Ont., will shortly commence work upon erection of a planing mill to cost $2,000. The building will be two storeys, 40 x 60. The mill is to be of brick construction, with concrete foundation and electric lighting. The equipment will include planer, jointer, turning lathe and general equipment for a planing mill, none of which has yet been purchased.

Frequent reports have been published regarding the proposed establishing of various lumber plants, at Fort Frances. The latest is a report to the effect that the Edward Hines Lumber Company, of Chicago, who own extensive timber limits in the neighborhood of Fort Frances under the name of the Seine Lumber Company, will build a large sawmill, at or near Fort Frances. The company already have several camps, at Banning, which will take out a large quantity of timber this winter and it is said that the proposed mill will be ready to manufacture lumber from these logs next spring.

A saw mill with a capacity of 30,000 feet per day, operated by 135 h.p. engines has recently been erected at Timmins Landing in New Ontario, by the Porcupine Power Company Limited. The mill is to take the place of a smaller one which was destroyed by fire a short time previous. The plant is driven entirely by electric motors, each machine having an independent drive. Power for running these machines is transmitted from Sandy Falls, 5 miles distant, on 12,000 volts, 25 cycles. The machinery consists of a complete sawmill plant, built by the E. Long Manufacturing Company, of Orillia, and a Berlin No. 108 matcher.

The ratepayers of Dryden, Ont., have passed a by-law to exempt the Dryden Timber and Power Company from taxation for ten years, to fix their school assessment at $60,000 for ten years and to grant the company by deed a public park of 250 acres. The company are making rapid progress with their pulp plant. The buildings will all be of brick and concrete and will cover 50,000 square yards. The mill will have a capacity of 10,000 tons per annum, which will require the use of 20,000 cords of wood, 4,000 tons of salt cake, 1,000 tons of lime, and 7,000 tons of coal, in addition to the utilization of all available sawmill waste. From 150 to 200 men will be employed, and the pay-roll will amount to over $200,000 per annum. The park voted to the company is the site of the plant.

Eastern Canada

Stanley Douglas has purchased 3,000 acres of hard and soft timber, at Stanley, near Fredericton, N. B., and will erect a mill.

The Chaudiers Mill Store Company Limited, Breakeyville, Que., has been incorporated with a capital of $20,000 to carry on business as general lumber merchants. The incorporators are G. Breakey, M. Begin and G. D. Anderson, all of Breakeyville.

The Rothesay Lumber Company, Montreal, Que., has been incorporated with a capital of $20,000 to carry on business as timber merchants, saw mill owners, &c.; incorporators, H. S. Ross and R. Taschereau, advocates of Montreal, represent the company.

The Gatineau Industrial Company Limited, Hervey Junction, Que., has been incorporated with a capital of $200,000 to carry on business as manufacturers and dealers in lumber, timber, paper, &c. The incorporators are Hugh Doheny, contractor of Montreal; D. S. Scott of Hervey Junction and M. J. O'Brien of Renfrew, Ont.

The Canadian Timber Yards Limited, Montreal, Que., have been incorporated with a capital of $1,000,000 to carry on business as manufacturers and merchants of timber, lumber, &c., saw mill proprietors, lumber yards, mills, storehouses, &c. The incorporators are Geo. V. Cousins, G. Penny, and S. T. Mains, all of Montreal.

Western Canada

The Crown Lumber Company of Calgary, Alta., will erect a lumber yard in the C. P. R. Industrial District.

A. E. Watts, of the Wattsburg Lumber Company, Wattsburg, B. C., has applied to the city of Calgary for a site, near the junction of the C. N.R. and C.P.R. for establishing a plant.

Messrs. Fetherstonhaugh & Company report that Canadian patents have been granted to F. Henschell, Strathcona, Alta., for saw setting machines, and to H. A. Underwood, Stettlin, Alta., for band circular saws.

The Riverside Lumber Company, who already employ about 200 men in their plant, at Calgary, Alta., are applying for a site in the Manchester sub-division on which to build a sash and door factory and also a box factory.

The Bellingham Bay Lumber Company, of San Francisco, Cal., has secured an Extra-Provincial license to carry on business in the Province of British Columbia. The head office for British Columbia will be at Vancouver. Bruce M. Farris is attorney for the company.

The Phoenix Lumber Company, Limited, Transcona, Man., has been incorporated with a capital of $20,000, to carry on business as timber, lumber and pulp manufacturers, general contractors, etc. The incorporators are J. W. Morrison, L. J. Carey, J. Suther, and E. J. Tarr, all of Winnipeg.

The Westholme Lumber Company have secured a contract for forty miles of grading for the extension of E. & N. Railway to Union Bay, B.C. The company are now sending in their camp along the right of way. They are providing for accommodating between 500 and 600 workmen whom they will have on the line before Christmas.

The McLelan Lumber Company, of Vancouver, have taken tenders for the general contract on their new mill at Ladner's Landing, near New Westminster. The general contract includes wharves, mill, planer, dry kilns, decks, all machinery, in fact everything with the exception of one boiler. A small mill is located on the company's property, which will furnish all necessary lumber.

M. Kellie, of Revelstoke, reports that a syndicate of Montreal and Ottawa capitalists have purchased for $1,000,000 the timber holdings of the British Columbia Timbers, Limited, on the south fork of the Fraser river above Fort George. The right of way of the Grand Trunk Pacific is said to pass through the timber. It is reported that the amount of timber on the Fraser river licenses is estimated at 4,000,000,000 feet.

The formal opening of the Powell River Pulp and Paper company's plant at Powell River, B. C., is expected to take place during the present month. As soon as the plant is in operation it is reported that the company will commence the erection of an addition which will double its capacity. The addition is expected to cost about $1,000,000. It is the intention of the company ultimately to increase the plant till it has eight machines.

It is reported that a transfer of the large holdings of the Red Cliff Lumber Company, of Duluth, Minn., in the Alberni district of Vancouver Island, to a syndicate of German investors, has been completed. The transfer, which had been in process of consummation for some time, involved a purchase price of considerably more than $2,000,000. The property contains some of the largest and most prolific timber in the world, and lies in the heart of the famous timber district along China creek, Ash river and Sproat lake. The deal was arranged with the German syndicate through Mr. Alvo von Alvensleben by Messrs. E. O. Weston, R. Wilson Clark and Morse Davis of Victoria. The vendors' end was handled by Mr. Walter H. Prescott, of Alberni.

Bloedel, Stewart & Welsh, Limited, who were recently organized with $500,000 capital under the laws of British Columbia have acquired the holdings of T. L. Shevlin amounting to 7,800 acres and the Gulf Lumber Company 4,000 acres additional. They are building five miles of standard logging railway from Myrtle Point into their timber. They are equipping the railway with one Shay Geared locomotive and a number of donkey engines purchased from the Vancouver Iron Works at Vancouver, B. C. All of the material except the locomotive was purchased in Canada. For the present the corporation will operate as loggers only, selling their product to the saw mills of British Columbia located on tide water. At a later date it is their intention to build a saw mill at some convenient point on the British Columbia coast with a view of supplying the rapidly increasing demand for lumber from the prairies and also exporting lumber to foreign countries. The company maintain headquarters in the Winch Building, Vancouver, B. C., with main works at Myrtle Point near Van Anda, B. C.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

1227. **Box shooks and boxwood cases.**—A South African firm of indent merchants desires to be placed in communication with Canadian manufacturers and exporters of box shooks and boxwood cases of all descriptions.

1251. **Lumber; cedar shingles.**—A lumber firm in Speightstown, Barbados, would like to hear from exporters of lumber generally; and cedar shingles in particular.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

WE will make especially low prices on the following Dry Stock for immediate shipment:

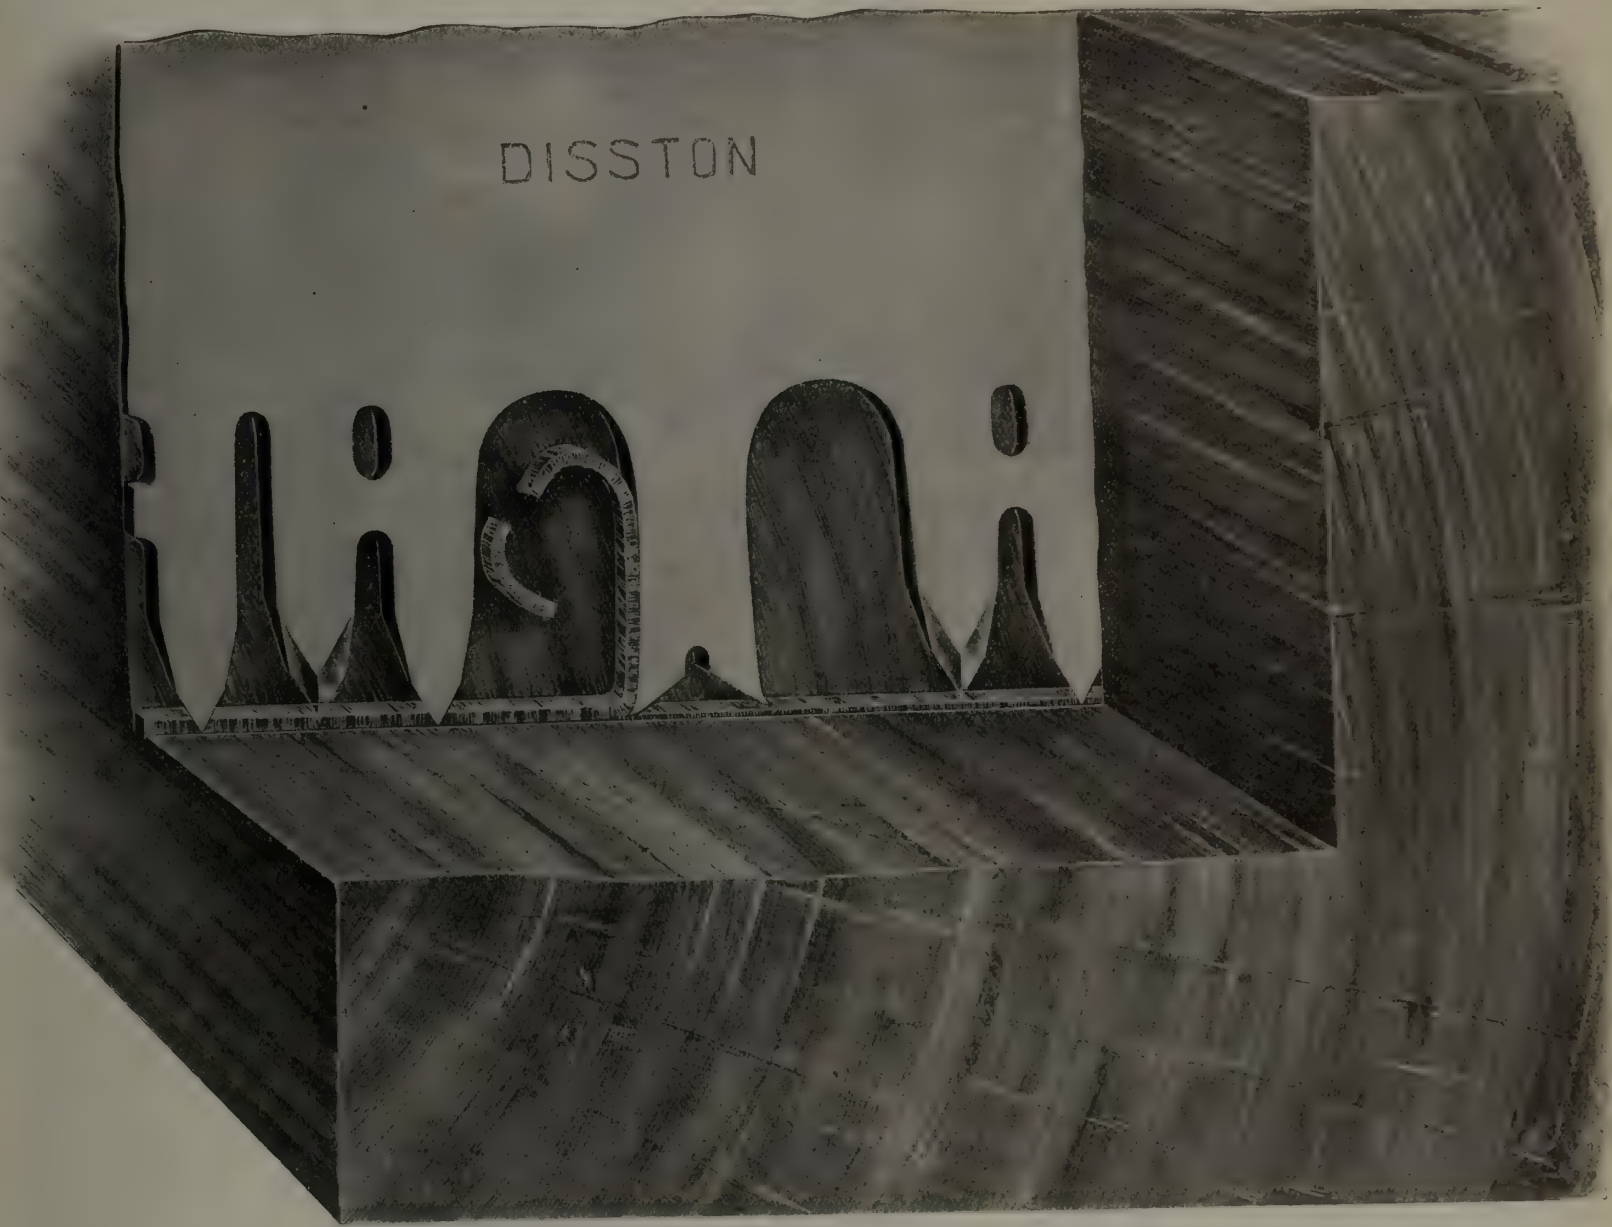
The RAKER
is the controlling power in Crosscut Sawing



"The question of length of "Rakers" or Cleaner Teeth is brought up from time to time by someone who has not been through the mill of experience, also the statements that the Rakers DO ALL THE WORK, should be on line or even with the cutting-points of the saw, etc., etc. This latter, of course, will appear ridiculous to experienced crosscut saw users, but, nevertheless, as new men are coming on the field all the time and do not possess the knowledge, an explanation is worth while, for quick progress can be made only in profiting by the experience of others."

The above is a quotation from our four page circular on "The Raker Tooth," the most complete article ever written on the subject. It's free for the asking—just drop us a postal giving your name and address, mentioning this journal.

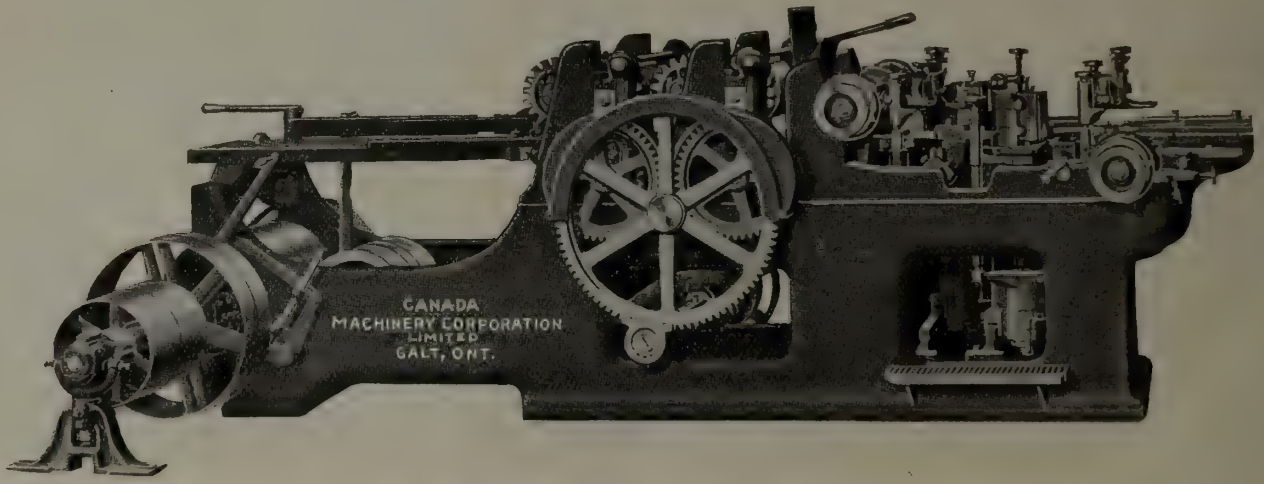
No. 300 Heavy Duty Inside Moulder

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.



No. 300 Heavy Duty Inside Moulder

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

You can Actually Increase Your Output By Installing A Jeffrey Log Haul-up

Illustration shows a Jeffrey Log Haul-up recently installed at one of the largest Lumber Camps, hauling forty to fifty thousand feet of lumber per day. The logs are hauled to the mill and the waste and offal are handled mechanically by Jeffrey Conveyor System.

We design and build Conveying Machinery, including chain and Cable Conveyors for all purposes around Saw Mills, Lumber Camps and Wood-working Industries; also a complete line of Power Transmission Machinery.

Let us send you Catalog No. 57 containing full particulars

Locating the Selling Points

In building bridges, the engineer has to cross streams, cut embankments, remove obstructions—but he finally gets a short route for folks and goods from ***here*** to ***there.***

Our reports are a bridge between the man who ***has*** and the man who ***needs.***

The man who has and the man who ***needs***—they are the parties of real importance in every commercial transaction. If you are the man who ***has,*** let us explain our facilities for constructing a bridge to the man who ***needs.***

In other words; if you want to know where there are opportunities for your getting business, the short cut to wider markets—better prices—is by our service.

Our organization covers the nine Canadian Provinces like a blanket. In each town we have a man who knows how to get news—men who can locate sales opportunities for you.

It is worth while investigating.

Tell us what you sell and where you sell it. If we can serve you, we will tell you how.

It's up to you.

Pulley

RAISING THE DUST

You know how disagreeable it is, how unhealthy it is, how it reduces the productive efficiency of employees in hazy and choky atmospheres where dust is being raised, and so costs you money.

Among the many advantages of POSITIVE Combination Pulleys is the fact that the narrow of the arms cuts the plane of rotation, thereby obviating fanning. In fact, the arms are totally invisible while running.

In your wood working shops, pattern shops and other dusty places, it means economy to use POSITIVE Pulleys, because they are built to avoid Raising the Dust.

OILDAG

(REGISTERED TRADE MAKR)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super-heated steam practice."

NUMBER 209
J.A. FAY & EGAN CO. CINCINNATI, O.U.S.A.
PATENTED MAY 20 1902 OCT 23 1906

No. 209 Four-Side Molder, 7″

Patented May 20, '02, Oct. 10, '02, Oct. 23, '06.

A Modern Molder

This new "high efficiency" type has these features:

1st—One-piece frame
2nd—Wide Open Construction
3rd—Clamp Bearings
4th—Spring Pressures to Feed Rolls
5th—Detachable Outside Bearing to Upper Head
6th—Self Contained and Adjustable Countershaft
7th—Bed raises and lowers on screws mounted on ball bearings
8th—Down driven feed rolls with wide-faced driving gears
9th—Reversible plate under upper head, one side plain and the other grooved for over-swinging cutters
10th—Feeds arranged for fine or coarse work

When buying a Fay & Egan molder you get every one of these features, plus that built in quality gained as the result of eighty-one years' experience in building high grade wood-working machinery.

In addition you have the most complete line to choose from. From 4″ to 14″ wide we build a machine to suit any and every purpose.

The biggest and most particular mills and shops in the country, especially where accurate manufacturing costs are kept, are using Fay & Egan molders because they have found them to be in a class by themselves when it comes to doing fine work, and lots of it, day after day without expensive shut-downs.

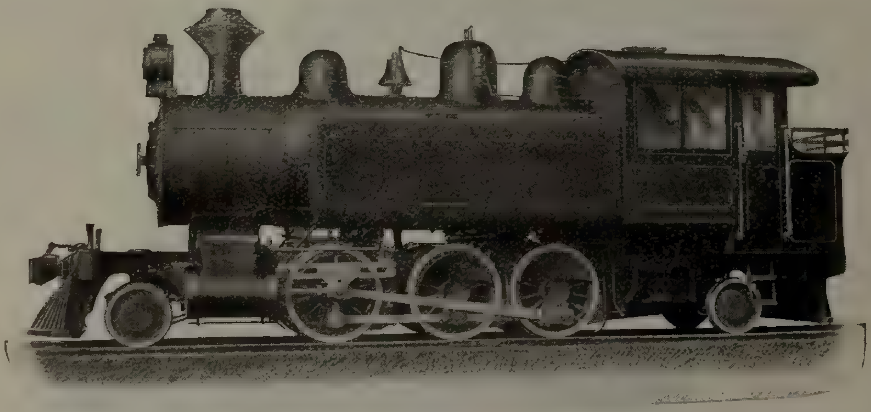
INDUSTRIAL LOCOMOTIVES



Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

MONTREAL LOCOMOTIVE WORKS, LIMITED

Twelve men *trying* to move an *empty* car

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.

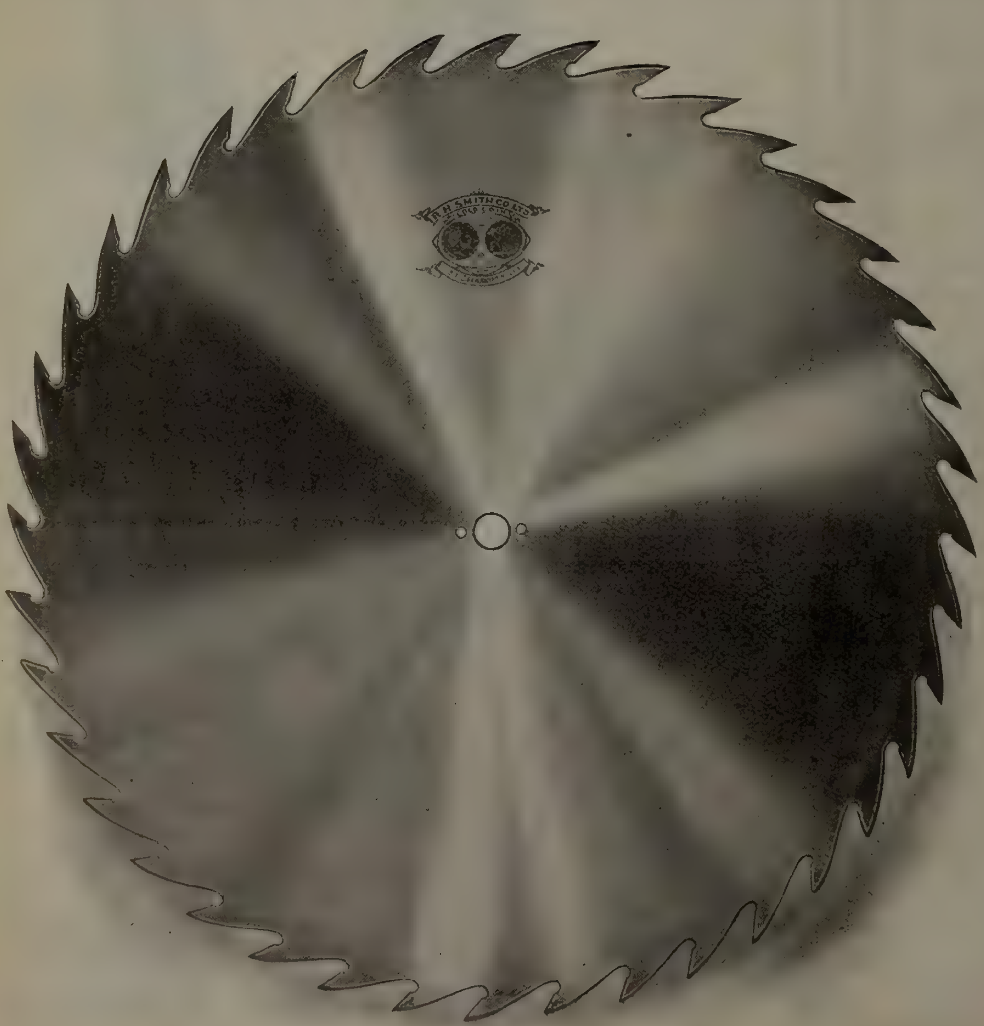
Solid and Inserted Tooth

Circular Saws



We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper througout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

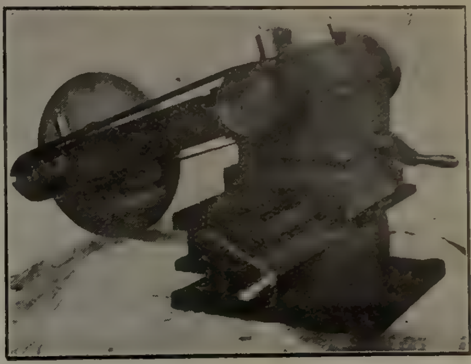
The "Midland" Band Wheel Grinder



After this machine has been attached to the Frame of the mill it can be adjusted and put to work in twenty minutes.

One Setting Grinds Both Wheels.

The whole operation done before you can get enough timbers together to rig up any of the Grinders now on the market. Every Sawmill man knows that Band Wheels should be ground oftener than they are, but with the heretofore existing appliances this operation meant a shut-down for two or three days. With **THE MIDLAND** you can grind up at any time, and by keeping your wheels in shape make and save money.

Further particulars on request.

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

The Enviable Reputation earned by

STILL'S AXE HANDLES

Has been built up chiefly by attention to two details:

1. Care in the selection and seasoning of the wood.
2. Skill in the shaping and balancing of the handle.

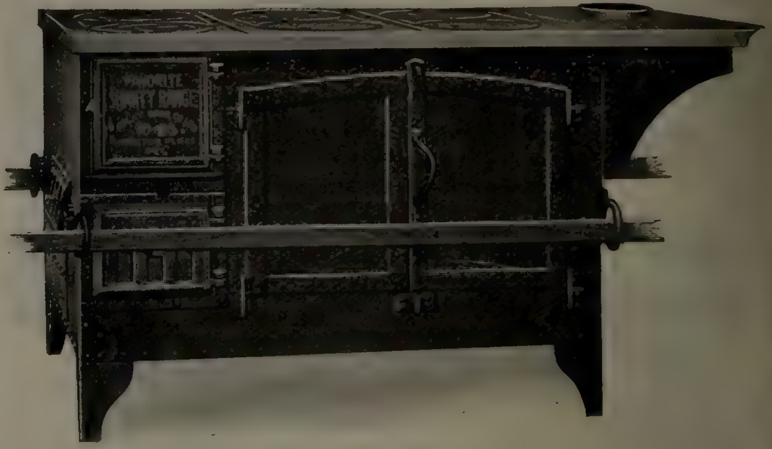
As a genuine satisfaction-giving line, Still's Handles have no superior and very few equals. The prices will interest you.

J. H. Still Mfg. Co., Ltd.

St. Thomas, Ontario

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps



This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

Note the malleable lift rings to accomodate poles for the portaging of the Range. This is a handy feature only found on the Favorite Shanty Range.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

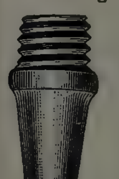
NEVERSLIP Red Tip HORSE SHOE CALKS

are the best for Heavy Hauls on Steep Grades

Neverslip **Red Tip** Calks are peculiarly adapted for use in Lumber Camps and Lumber Yards, where deep ruts make footing uncertain and steep ice covered mountain grades make a fall a serious accident.

A horse that is continually sliding and floundering loses confidence in itself, becomes nervous, and generally incapable of the work expected of him under less adverse circumstances.

Neverslip **Red Tip** Calks overcome all such conditions of winter travel, makes the horse secure of footing and in that security fully able to cope with sleet and storm and do the average day's work.



The horse shod with Neverslip **Red Tip** Calks can negotiate any hill however slippery and circuitous routes, taking valuable time of men and teams are unnecessary.

In preventing accident the Neverslip Calk preserves the usefulness, perhaps the life of your horse, and pays for itself many times over.

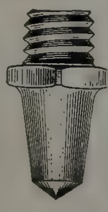
RED TIP

Every owner of horses knows the loss in time occasioned by having men and horses waiting around a blacksmith shop to have horses sharpened. It may be a matter of an hour, sometimes the best part of a day, before your turn comes and when business is pressing such delay means loss of money.

A new set of Neverslip **Red Tip** Calks can be inserted by your shoer in 20 minutes and once in are firm, secure and an integral part of the shoe itself, absolutely proof against wobbling or wearing loose and never breaking off.

Do not confuse the name **Neverslip** with cheap inferior calks that may be offered by unscrupulous dealers as just as good.

To protect you against fraud the genuine Neverslip Calks and Shoes have a RED TIP, which is a mark of quality and a guarantee that you are gettinge the best.



Look for the RED TIP and refuse substitutes.

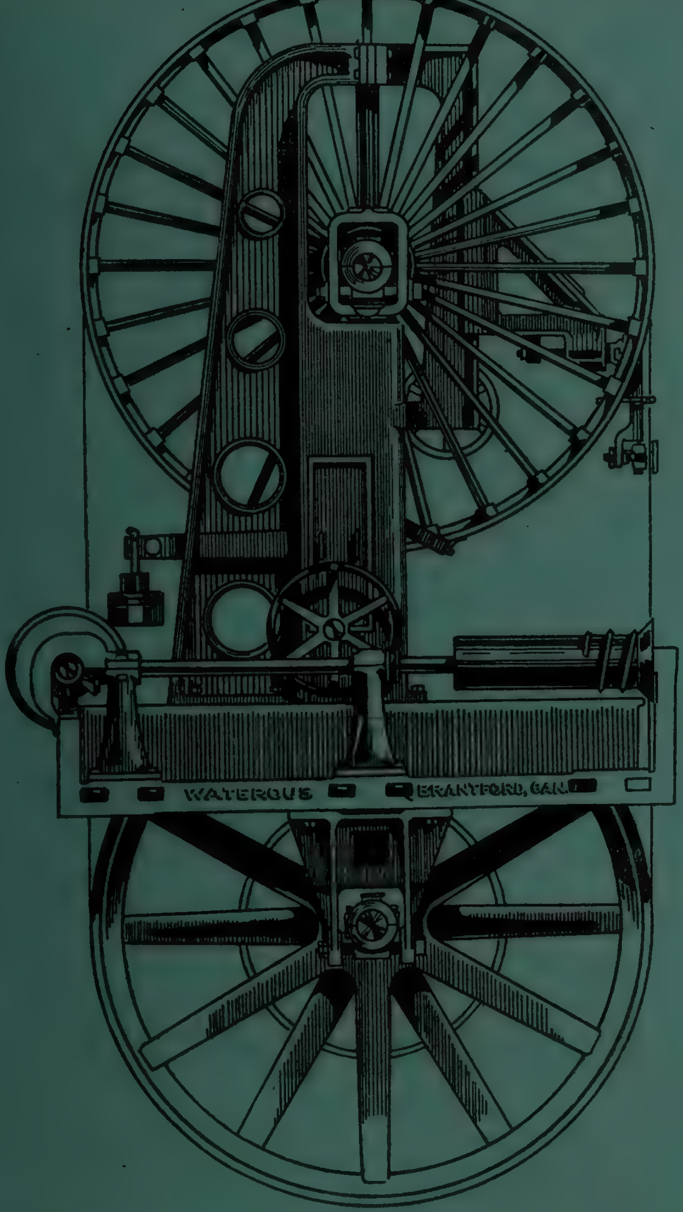
"WHY" and "HOW"

We Build a 7 ft. Band Mill



It will take a saw up to 12-in. blade, will split a 36-in. log, has all the fast cutting features of the larger sized mills and yet represents a saving of several hundred dollars in initial expense, in up-keep in saws and in filing tool equipment.

Although containing all these fast-cutting features, we are able to build this, 7-foot mill cheaper than would be possible if we had not already done the expensive experimental work and tested these features out on our heavier mills. All you pay for is the cost of construction.

HOW—

The Waterous 7-foot Band Mill is built right and left hand for single or double cutting. **The frame** extends completely around the mill, is very wide and deep, carries on it all feed rolls, etc., to make the machine entirely self-contained. **Columns** are a combination of box and girder section, of graceful business-like design, have wide bearings on the frame and grip the mandrel supporting posts above and below the mandrel. The long recess in the columns permits an exceptionally long vertical adjustment of the upper wheel.

Both wheels are built on old designs that have proved themselves practically perfect in weight proportion and smooth running qualities. **Mandrel boxes** are adjustable in all directions, are extra long, babbitted with finest bearing babbit, and are chambered for water cooling.

Tension and tilting device and raising and lowering mechanism are those supplied on our heavier mills. They are completely enclosed within the columns where they are kept absolutely free of sawdust, slivers, etc. A large door in each column permits of ready overhauling. **The tension device** has been in use for several years and has proved itself second to none on the market. Every fulcrum point is double knife edged and weights are carried on self-cushioning springs which absorb sudden shocks and jars that might affect the saw. **The raising and lowering** is effected by means of a hand wheel and double threaded jack screw working in the bottom of upper mandrel supporting posts. Jack screws are connected to raise and lower upper mandrel in perfect line.

Both upper and lower guides swing exactly about the centre of saw blade, both are instantaneous opening, with wide space between jaws for quick removal of sawdust and slivers. **Upper guide** is particularly rigid, is provided with safety slide, has brass plug contact with saw blade and water lubrication. It is raised or lowered by a special steam raising device or by hand wheel and chain—both giving positive and rapid movement. **Lower guide** can be operated from front or rear of mill as desired. **Live rolls** are carried on the frame, a bevel ended worm roll as illustrated being supplied with double cutter, speed 400 feet per minute.

The bystanding cut made from the machine drawing itself, shows the graceful, clean-cut, business-like design of this mill. Every part is built to combine strength and rigidity, and the mill is put together by experts in this work. **We test every machine before it leaves the shop.**

WHY—

Because there is a demand for a mill that will handle logs of fairly large diameter—that, is larger than can be cut on a Pony Mill—that will cut faster than the Pony and at the same time will be less expensive than the heavy 8 ft., 9 ft., and 10 ft. mills on the market at the present time.

The Waterous 7 ft. Band Mill fills these requirements in every particular.

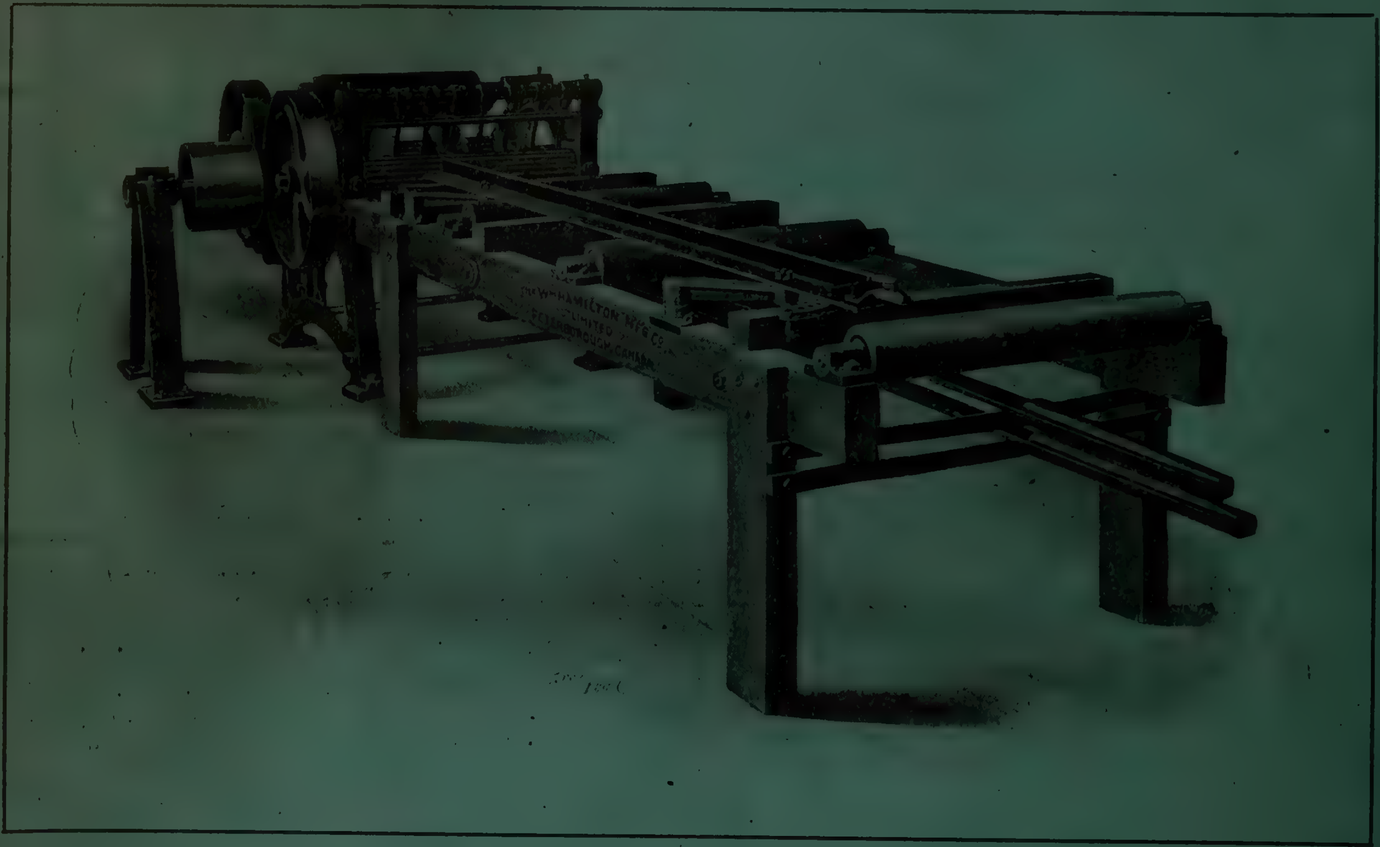
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

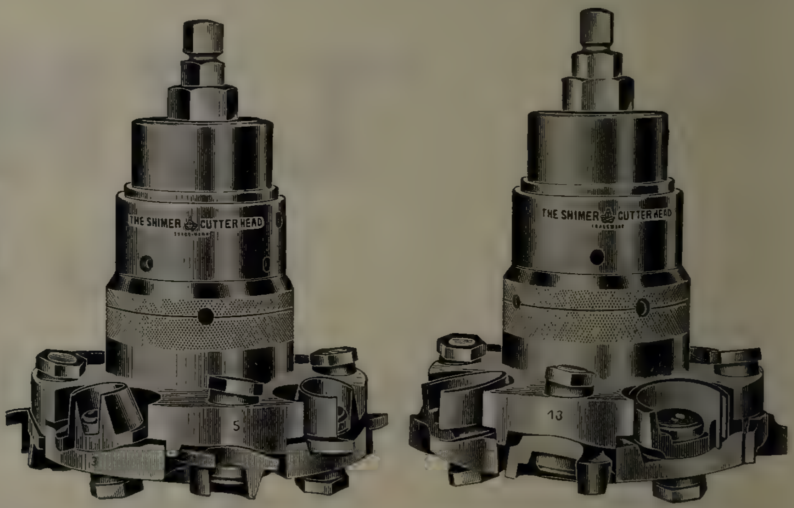
ASK THE MAN WHO OWNS ONE

There are few mills in this country that do not contain at least one set of



The Shimer Cutter Heads

If you do not use them, ask your neighbor or any practical mill man about their labor and time-saving qualities.

Every man in your employ commands a certain amount of "cold cash" for his service which is due him with all respect. On his very time, and on the time of the machine he operates you make or lose according to his effort and ability. If you can place a tool into his hands that will enable him to do better service, with less labor, it is not only a reflection of credit upon the man, but it results in an increase of earning capacity, without an increase of operating expense.

This is the way Shimer Cutter Heads are making good in hundreds of mills, and if they help some, why should they not also help you?

Send us your trial order to-day.

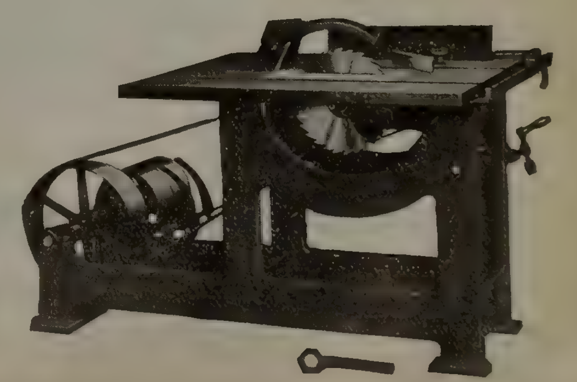
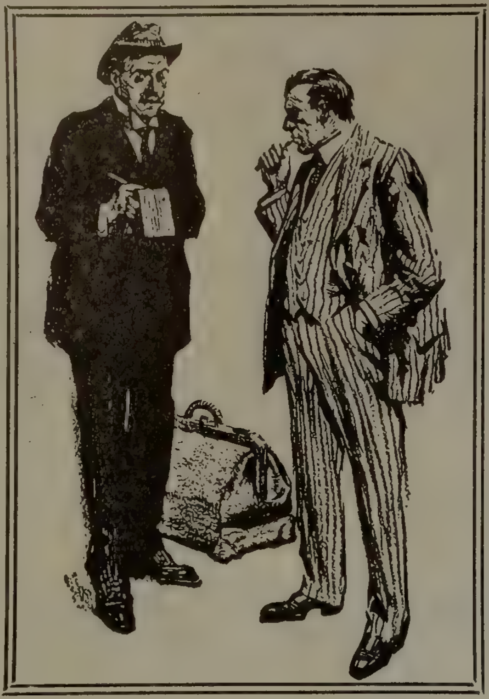
Post up on these tools. Ask for our 1911 catalogue and special prices at once.

THE SILVER MFG. CO.
375 BROADWAY SALEM, OHIO.





Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business —made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

Keystone

Two or Three-Saw Double Edgers

are in a class by themselves

Heavy, Solid, well proportioned frame

Built with Driving Pulleys Set-Works, etc.

2 or 3 Saw Double Edger

The above cut represents the most up-to-date and accurately constructed edger on the market to-day.

THE KEYSTONE

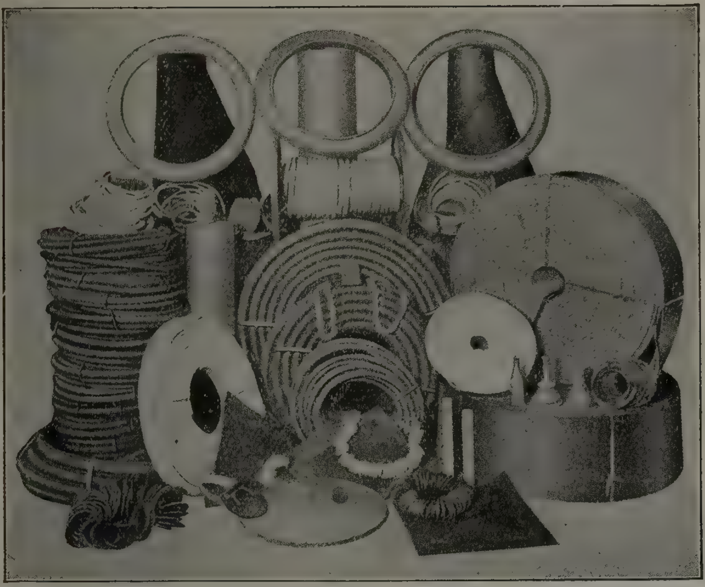
The arbor is made of forged steel and runs in long self-oiling boxes, is double key seated and carries two saws. Feed works are very simple. Wheel-set works. Spiked rolls on tables and fluted on the machine always keeps the lumber in place.

Wanted—Reliable Canadian Representative.

Rothfus-Howard Iron Works
Williamsport, Pennsylvania

Power-Saving High-Efficiency Belts

For Planers, Dynamos, Generators, Fan Work, Etc.



A few of the Lines we Manufacture

Make your power transmission an ASSET instead of a LIABILITY—a money-saver instead of a power waster. Belt your machinery with

GOODYEAR

Imperial High-Speed

Friction-Surface Belts

"The Belt that Clings."

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre **cotton fabric,** rubberized, cured and vulcanized into one solid, enduring piece.

Earns Cost—Costs Less

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

Wears Longest Without Stretching

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes **internal friction.** This soon wears the life out of best leather belting and is caused by internal **grinding** as the belt bends and whizzes around small high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the **stretch has all been taken out,** rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed friction-surface, wear-resisting belting.

We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high.quality materials, skilful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U.S.A. Write us at once.

CAMP SUPPLIES

If you are looking for QUALITY in your Camp Supplies, you should specify:

"ANCHOR" brand—

BAKING POWDER
JELLY POWDERS
EXTRACTS, SPICES
COFFEE — TEA
(In sealed air tight packages)
Sweetened MILK Unsweeted
CANNED—
SALMON, FRUITS
and VEGETABLES

The Quality Is Guaranteed The Best It Is Possible To Produce

WE CARRY A FULL RANGE OF CAMP SUPPLIES

Wholesale Grocers **EBY-BLAIN, LIMITED** Importers and Manufacturers

TERMS OF SUBSCRIPTION:
Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3,00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 Toronto, December 1, 1911 No. 23

The Hemlock Industry's Troubles

At the recent meeting of the manufacturers and wholesalers of hemlock which was held in Toronto, one of the most signficant remarks made was by Mr. Norman Hocken, of Otter Lake Station, regarding the increasing cost of operation. Mr. Hocken stated that the cost of provisions had, within a short time, advanced 25 per cent., and that in some lines there had even been an advance of 100 per cent. Other members present, while showing an inclination to disagree with Mr. Hocken as to the extent of the increase were unanimous in stating that the cost of operation had increased out of all proportion to any improvement which might have occurred in market conditions. Taking these facts into consideration, in conjunction with the lack of any definite grading rules for hemlock lumber in Ontario, it is not to be wondered that everyone has been inclined in the past to make the most they could out of their lumber by means of various grading methods. This is not to infer that there has been a general tendency to manipulate the grades, but it does mean that everyone has had his own ideas of the meaning of a grade and has marketed his lumber accordingly. The result has been chaos, and matters have been going so rapidly from bad to worse that the retailer, thoroughly appreciating the situation, has succeeded in forcing up the grades and in getting in his No. 2, a class of lumber which might in some cases have been placed in the No. 1. On the other hand, the retailer has not been making any appreciable advantage out of the situation because he has had to put up with a great amount of uncertainty about the class of lumber he would get when he ordered a certain grade and has often made complaints which involved both him and the manufacturer or the wholesaler in serious difficulties and expense.

There should be no continuance of these conditions and it is to be hoped that the manufacturers and wholesalers will adopt a set of rules which are being drawn up by those who have been holding meetings for the purpose, and will put them into uniform practice. It is felt that these rules, if put into practice and supported unanimously, especially by the manufacturers, will go far towards putting an end to the wretched state of affairs at present existing.

On December 27th a meeting of all those who are interested in the manufacture and sale of hemlock in Ontario will be held at the Queen's Hotel, Toronto, when the rules as they have been prepared by a committee will be submitted. It is hoped that at this meeting the rules will be accepted and adopted. As to the method of enforcing them, this will have to be discussed at the meeting. Some who have already given the matter their close attention are inclined to believe that it will be possible to enforce the rules by a mutual agreement of those interested and that the rules will commend themselves so decidedly to the industry and to the trade that they will be quickly accepted by all. In order to settle disputes, however, something in the form of a board of inspectors will have to be ararnged for and when this is done the trade will be in a fair way towards bidding good bye to one of the worst of the troubles which have beset it for many years. Another method of enforcing the rules which commends itself, is by means of submitting them to the Canadian Lumbermen's Association for their approval. This would give them greatly added authority and would, to a great extent, simplify the work of persuading the trade in general to adopt them. If this course were adopted, a board of inspectors would also be necessary. It could be provided for either by the trade or by the Canadian Lumbermen's Association. These, however, are details which can easily be arranged once the rules have been accepted by a large number of the trade and industry.

The rules as already drawn up by the committee are published elsewhere in this issue. Roughly speaking they define No. 1 in both inch and dimension stock and also define dead culls. Everything coming below the grade of No. 1 is placed in No. 2, except dead culls. It was decided that this was a more satisfactory method of arriving at a definition of No. 2 than by attempting to define what percentage of knots, knot holes, shake, check, and rot should be included. Dead culls are defined as all pieces containing fifty per cent. or over of rot or other defects. Inch No. 1 is to carry not more than ten per cent. of pieces having wane (not more than half way across the edge and not more than 25 per cent. of the length), shall be sound and carry some shake and knots. The number and quality of the knots are definitely described. All who are interested in these rules should make a point of being present at the meeting on December 27th, when they are to be taken up.

Lumber Waste for Pulpwood

For the purposes of manufacturing the four hundred and seventy-five thousand tons of wood pulp produced in Canada in 1910 nothing was used except logs of various species, which as our timber supply decreases are becoming valuable for lumber and other uses. No slabs or other sawmill waste was reported as being converted into wood pulp, by neglecting which practice, Canada is losing greatly. During 1909 in the United States six per cent. of the total pulpwood consumption was from slabs and mill trimmings. If economy had been practised to the same extent in Canada during the year 1910, as much pulp might have been produced as from thirty-six thousand cords of wood and not one pulp log need have been cut. This would have made twenty per cent. more pulp than Nova Scotia produced in 1910.

Looking at the subject from another view point the gain might have been much greater. Over one-half of the five billion feet of lumber cut in 1910 passed through mills at centres of large population where the slab waste of one-half cord to every thousand feet of lumber might have been saved from the incinerators. One cord of pulpwood will produce at least one-half ton of pulp so that one and a quarter million cords of slabs obtained would have produced at the lowest estimate six hundred and twenty-five thousand tons of pulp. This amount is thirty per cent. more than the total of four hundred and seventy-five thousand tons of pulp produced in Canada in 1910. The sooner such practical economy and utilization of wood waste commences the longer will Canada have an adequate supply of pulpwood.

Scarcity of Timber on Hudson Bay Line

An interview with an engineer given recently in a western paper to the effect that there is abundant timber on the line of the Hudson Bay Railway is an illustration of the misapprehension in regard to this matter that exists in the public mind. Because there are large areas of land in the north on which there is timber of some kind, the conclusion is reached that it is all of present value and that the country has an unlimited supply. As a matter of fact a careful inspection of the timber along the line of the Hudson Bay Railway made in the years 1910 and 1911, by the Forestry Branch of the Department of the Interior, shows that there is not enough mature timber along the line of that railway to build the road. There are no prairie districts of any extent along the route, there are trees everywhere, but owing to repeated fires the forest is, except on the merest fraction of the area, too small for commercial purposes, and unless it can be protected from fire until it reaches maturity, will never be of any use to the country. Explorations in other parts of the northern forested districts tell the same tale. Everywhere fire has worked havoc, and the forest is a mere wreck of what it might have been if fires could be prevented. And unless adequate measures are taken now to protect the young and immature forests which form the major part of the stand, the outlook for the future is none too good.

If the northern forests are to continue to be a permanent source of wealth to the country, it is absolutely necessary that the fire ranging system should be extended and that proper methods of management of the forest should be applied, and public education to the value of the forest is even more necessary. Sweden, which has large extents of northern forest, practically uninhabited, similar to those in northern Canada, has about eliminated the fire danger in such districts mainly by educating her people to the value of the forests.

Shall Lumber be Dutiable

The signs of the times are all pointing in the direction of an active campaign on the part of the lumbermen of Canada in favor of having a duty placed upon lumber entering the country. No one subject is of more importance to the lumber trade and industry today. It is a matter of the greatest importance to everyone that if steps are to be taken they should be conceived and carried out in a manner which will present the objects desired in a clear and definite form, and that the movement shall have behind it the unanimous support of the whole trade and industry. In 1905 one of the best managed deputations which ever approached the Dominion Government presented the arguments in favor of a duty on lumber, and they were told by Sir Wilfrid Laurier that no subject had ever been presented to him by a delegation in so able a manner. In spite of this nothing was secured. Since that time there has been a great reversal in public sentiment throughout the country and to-day another government is in power—a government which stands for a fair measure of protection to all industries which require it for their reasonable progress, and a government, the predecessors of which have done much by means of protection to enable Canada to reach the enviable stage of commercial and financial prosperity which are hers to-day.

It is reasonable for the lumbermen of Canada to seize the opportunity presented and do their utmost to have removed the unfair burden under which they have suffered. The unfairness of the burden was admitted by Sir Wilfrid Laurier in 1905 to the delegation which presented the case. His own words were: "The Government cannot help recognizing that the lumberman is taxed on everything and has no corresponding advantage as against outside competition." Continuing he explained why the duty which formerly had been in force for a short time had been removed. "It was for the benefit of the consumer in the Northwest," he said, "particularly the new settlers, whom we thought were entitled to special benefits." Moreover, "It was," Sir Wilfrid added, "at a time when Canadian lumber was admitted free to the United States—a condition which has been reversed since in the United States. That phase of the case cannot but impress itself forcibly upon us."

The members of the delegation at that time, taking into considerain the sympathetic view of the Prime Minister, had good reason to hope that their claim would be recognized. But it was not to be. The Prime Minister told the lumbermen that they "must have faith in the Government." They had faith, but apparently it was misplaced, for the government continued in the belief that the consumers of the Northwest still had a greater claim upon their assistance. To-day the conditions are reversed. Granting, for the sake of argument, that the consumers of the Northwest needed this assistance six years ago, and that the lumbermen of the country were not the only ones who ought to be taxed to give them this support, the question arises to-day whether these conditions still continue. So successful has been the assistance given to the consumers in the Northwest that the whole world has been reading with wonder of the unexampled prosperity of the new settlers who have gone into that country and who have risen in a few years to a condition of affluence such as they had never dreamed of. That they have been able to do so has in no small measure been due to the fact that they have, in regard to one of their important necessities—lumber—been able to reap the benefits of a throat-cutting competition, introduced and carried to incredible lengths by the producers of lumber in the United States. To-day the settlers in the Northwest are in a splendid position. Those who have been there a few years are well set up in the vast majority of cases, and the prospects for new arrivals are so good that they are flocking into the countrw from all parts of the world. The lumberman, on the other hand, has been undergoing a steadily increasing financial pressure, and to-day, he is, in many cases, obliged to reduce his operations and to allow much of his capital to remain idle, while watching the cheaper, and in many cases inferior, lumber of the United States, going into the buildings of the settlers.

That the lumbermen of Canada are actually suffering seriously from this condition of affairs is not an ill-considered assertion. It is borne out by the facts. Reports are continually being received to the effect that on account of the competition of United States lumber, Canadian manufacturers are closing their mills or greatly reducing their operations. In British Columbia, the Coast and Mountain millmen have decided to close a number of their mills throughout the year 1912. In the Northwest, similar cases are frequent. The latest is that of Mr. John Walter, one of the most extensive lumber manufacturers in Alberta. He has to-day, practically decided to make no preparation during the present winter for sawing lumber during the summer of 1912. This means that during the winter his large logging camps will be idle, and that the two large mills operated by him at Edmonton and Strathcona will be closed next summer. The lumber markets of the Northwest are in a sagging condition to-day, as the United States lumber is able to undersell the Canadian product. In Eastern Canada, when every other line of industry is feeling the stimulous of good times, the lumber manufacturers are curtailing their operations in practically all parts of the country. If it were not for the serious competition of United States lumber, manufactured under conditions which cannot be duplicated in Canada, and overproduced to an alarming extent, making it necessary to dump the surplus in Canada, this unfortunate state of affairs would not exist in Canada to-day. With every one else prospering in Canada to-day, the lumberman is the only one who cannot look hopefully to the future. That this is caused by the taxation of everything he uses and the free entry into Canada of products which compete with his, cannot be gainsaid. The two facts are not simply coincident. The one is the logical outcome of the other, and the Government of Canada owes it to the industry to remove the burden without delay.

In this connection it is encouraging to note that the Canadian Lumbermen's Association are taking up the question and are securing the opinions of the members of the industry in all parts of Canada. If they find that they can depend upon the support of the industry they will inaugurate a campaign looking toward presenting the case before the government at an early date. Lumbermen owe it to themselves to encourage the association in this work and to promise it their unanimous support.

Concerning Credits and Business Building

No single branch of the lumbering industry is of more vital importance than that of credits. Discussions pro and con, regarding various principles in connection with the credit end of business are continually appearing in print and the last word will probably never be said. No hard and fast rule for a credit system can be laid down and adhered to, neither will a system which works well in one locality be useful in all others. Local conditions must prevail and regulate the whole credit fabric. We hear a great deal about the methods which are necessary for collecting overdue accounts, and it is in fact a considerable source of expense to every credit business, that accounts are allowed to become overdue. Therefore a tendency seems to have developed of late years in favor of reducing business as much as possible to a cash basis. This may be a wise rule in many cases, yet after all modern business depends upon credit for its existence and it would seem as though the line of success was more nearly along the line of judiciously extended credits than that of cash business. In this connection an interesting article from the American Lumberman is reproduced herewith.

There is a chance that the lumber trade may be mistaken in some of its deductions in regard to the extension of credit and that the retail trade, especially, may find it advisable to make track on this subject and instead of striving to reduce the line of credits to increase them, judiciously, but extend them, says the American Lumberman. Sometimes we get hold of a good idea and become so enthusiastic in following it out that we run it to an extreme point where it is no longer a good idea. This is what has been done in some instances in regard to credits. There has been in this country an era of advocating cash business. It is not at its height now—it passed that some years ago—but it has left a strong enough impression on the public mind to wield an influence and some things are now evident which point to the idea that this cash business theory has been carried out to an objectionable extreme.

A study of history as it was made by different countries and at different periods of time leads to the conclusion that the newer a country or community the fewer credits are given and the shorter the time allowed on such credits, while the older the country the more credit business and the longer time allowed. It is in the pioneer localities we find most of the cash business, considering a community as a whole, while in the older settled portions of this country there are more credits and longer credits and in the older countries the giving of credits is more general than here. It has even reached the point where some of the governments arrange a credit system by which poor people can buy land and build up their homes.

It is this home building idea that is an important factor in starting the thought that probably it is an erroneous theory to work toward the end of a strictly cash business in the retail lumber yard instead of the extension of credits. Whatever objection may be offered to the credit business in many other cities—that is, the going in debt by people for things which they could not get along without, and thus getting involved so deeply that they cannot meet their obligations—these things do not hold true with equal force as applied to going into debt for a home. When a man builds a home or improves on a home already established it is regarded as a good investment, even though it involves going into debt, and usually the better one surrounds himself with home building the more likely he is eventually to meet all his obligations. Some of our best known wealthy men have expressed themselves strongly on this point, and among the most widely quoted advice to young men starting out in business is to establish a home, to go in debt for it if necessary. Aside entirely from the social and moral features of encouraging home building and thus rapidly improving a community, there are certain commercial reasons which favor a liberal extension of credit under proper safeguards.

Coming closer home we find some of the most prominent mercantile establishments of the United States have been built up largely through wide, but judicious extension of credits. Probably the most noteworthy instance of this kind was in connection with the biggest hardware concern in the United States, which built up an enormous volume of trade in the South in the earlier days by extending credits in the cotton district, and through this means assumed eventually a magnitude of business which would not have been possible had there been the same effort at doing a strictly cash business, as is directed toward that end by many branches of the trade to-day.

So, while not for a moment losing sight of the desirable qualities of a business done on a strictly cash basis it may be wise to take the other viewpoint for a while among the retailers and see if there are not more advantages to be had on the other side. Some loss will be involved, it is true, the percentage of it depending materially on the judgment exercised in extending credits. In addition to a natural increase of trade will be better opportunities to meet what is termed mail order competition. Generally this mail order business is a strictly cash business and it is indulged in by people who have the money and are figuring so closely that there is not much margin left for profit. It is probable that had these same people that bought mail order goods during the last year been encouraged to buy for their needs earlier through a judicious extension of credit they would have had trade on which there was a fair profit and the community would have been better off all around.

That the extension of credit is an excellent means of building up more business often has been demonstrated. Unfortunately some of these demonstrations are not models to point to because they show greed on the part of those extending credits, but these objectionable features are faults in the people rather than in the credit system itself. There are honest and upright people in practically every honorable calling and the average business man likes square dealing and does not want to take unfair advantages of his fellow men, but there are others not so scrupulous and it is these and their doings which bring into disfavor some good business ideas.

The main question seems to be to extend credits judiciously and thus encourage more home building rather than how to eliminate credits and get on to a cash business. The majority of homes probably are built on what might be termed a credit basis; that is, are not completely paid for when first put up, and because of this there have been various building and loan associations, some good and some bad, installment real estate concerns which would have been better had they builded better, and last—but not least—some of the retailers financially able to handle the matter have taken up with the idea of building homes and extending credit on them to those who have enough to make it a safe investment. This helps home building and puts the matter under the control of the lumber trade more than former practices, and with a fair protection in the way of lien laws and the exercise of proper judgment the idea of further extension by retail men even though it may call for larger capital to conduct the business.—American Lumberman.

Proposed Grading Rules for Hemlock

Definite Set of Rules Drawn Up for Ontario Trade—General Meeting to Consider Them Called for December 27th—Yellow Pine Evil Discussed

A meeting of Ontario manufacturers and wholesalers of hemlock was held at the Queen's Hotel, Toronto, on November 22nd and 23rd, at which splendid progress was made in the direction of adopting a set of grading rules for hemlock. During the first day of the meeting a general discussion took place regarding trade conditions and a committee was appointed to draw up a set of rules and submit them on the following day. This was done and a draft set of rules was presented. A short discussion showed that several important changes were advisable and the committee held a further meeting on the evening of the second day, at which the rules were finally revised and put into what is believed to be a very workable and practical shape. Another meeting of those interested in the manufacture and sale of hemlock will be held on December 27th at the Queen's Hotel, Toronto, at which the rules will be presented by the committee and at which it is hoped that definite steps will be taken for the purpose of putting them into effect.

Another matter of much importance which was discussed at the meeting was the increasing importation of yellow pine into Canada. This competes strongly with Canadian hemlock, and white and red pine. The hemlock trade in Ontario are convinced that something should be done to draw the attention of the consumer of lumber to this and to point out especially the inflammable nature of yellow pine. With this object in view an invitation will be sent to the various associations of architects in Ontario and to the Dominion Association, to send representatives to the meeting at Toronto on December 27th. A similar invitation will be sent to the Fire Underwriters and it is hoped that by this means it may be possible to persuade the architects to give a preference to Canadian lumber.

The Rules Agreed Upon

The grading rules referred to above which will be submitted to the general meeting are as follows:

General Instructions:

The principal objects to be sought in the formulation of these rules are:

1. To establish grades that will blend slight characteristics incident to different localities in such a manner as to produce grades of equal quality and value, and so constructed as to be best adapted to the principal purposes for which hemlock lumber can be utilized.

2. The face side of the lumber is the side showing the best quality or appearance and the lumber should be inspected from the best side of the piece.

3. Defects in lumber should be distributed in proportion to the size of the piece. Wide pieces of the same grade may contain more and greater defects than narrower pieces.

4. Wane in lumber is a defect, and cannot extend more than half way across the edge of piece. and not more than 25 per cent. of the length.

5. In hemlock will often be found streaks or patches of red or brown discoloration, sound and firm, the presence of which does not weaken the wood, nor detract seriously from its utility. Water stain should not be confused with rot, being firm and strong, while rot is soft and decayed wood.

6. All the rules herein mentioned are for lumber in the rough. Any subsequent work put thereon is to be at the purchaser's risk as to change in grade.

Inch No. 1 hemlock: shall be 8-16 ft. long and 4 in. and up in width, not more than 15 per cent. 8 and 9 ft. lengths, otherwise standard lengths, and shall not carry more than 10 per cent. of pieces having wane as described in general instructions, shall be sound and carry some shake and knots. 25 per cent. of the pieces may contain black knots, not more than 3, according to width and length; for instance, 4 in. to 6 in. pieces may carry 1 standard black knot, 7 and 8 inch pieces, may carry 2 standard block knots, 10 in. and up may carry 3 standard black knots.

No. 1 dimension: will admit of shake that will not materially affect the strength of the piece. Also standard knots either black or red that are well located and fairly sound, or a knot hole that will not impair its strength, or some slight cross checks or sound water stain. This grade. while admitting the above defects, must at the same time retain the element of strength. Lengths shall be 8 ft. and up long, even lengths except 9 ft., and even widths.

Inch No. 2: shall be known as all lumber below the grade of No. 1 excluding dead culls. Dead culls shall be defined as follows: all pieces containing 50 per cent. or over of rot or other defects. Lengths in No. 2 shall be 6 ft. and up in length, even lengths except 9 ft., widths 4 in. and up.

2 inch No. 2: shall be the same grade and lengths as inch No. 2 but the widths shall be 4 in. and up even widths only.

Standards knots: shall not exceed 1¾ in. diameter.

Standard lengths: shall be 8 ft. and up in even feet except in the 9 ft. lengths.

The Wednesday Afternoon Session

At the Wednesday afternoon session Mr. Norman Hocken occupied the chair and Mr. H. J. Terry acted as secretary.

Mr. Hocken in opening the meeting referred briefly to the conditions prevailing in the trade to-day. He drew particular attention to the rapidly increasing cost of operation in the woods. Men were scarce to-day and the cost of provisions had simply gone up out of sight. They had advanced fully 25 per cent. in the last year and he thought some lines had advanced 100 per cent. Coupled with the high cost of operation, the absence of rules for the grading of hemlock was acting as a great drag upon the trade. One man had one set of rules and another man would come along and raise the grades and you would have to raise yours, until it had come about that they were selling No. 2 which used to be a merchantable a few years ago, and the price of hemlock had not advanced along with the grades. His own mill was in a splendid location for operating at a minimum cost yet it kept him hustling to make ends meet. He wondered how some of the others managed to exist at all.

As far as the market was concerned, he thought it was in a healthy condition, possibly a little better than normal for this time of year. But in spite of this the manufacturer was in a very serious position. The cost of standing timber had not been decreasing. The The cost of labor had increased and its quality had decreased. The cost of supplies had gone up also. In the face of these increased operating expenses the price they were obtaining for their material was the same as it had been a year ago.

Speaking of the demand for hemlock he reported that it was fair. In the past two or three weeks he had seen orders for about three million feet to quote upon.

Mr. Charles McGibbon, Penetanguishene, suggested that the meeting should proceed to appoint a committee to draw up rules for the grading of hemlock lumber and that the committee should report to the meeting on Thursday afternoon.

Speaking of trade conditions, Mr. McGibbon reported that they had been fairly good of late. They had not now as much material on hand as they had had a year ago. They had about a million and a half feet and anything they could get 16 feet long, it was hard to keep. The other lengths were apparently not so desirable. The small portable mills which manufactured so much 12 and 14 ft. stock, he believed, were responsible for the poor demand for the shorter lengths.

Mr. McGibbon then opened a discussion upon the importation of yellow pine into Canada. He could not understand why the architects and the public were so fond of yellow pine when you could take a piece of 10 in. x 10 in. and dress it, and then set it on fire by applying a match to it. In Collingwood, he said, the Grand Trunk were even using yellow pine for railroad ties in their yards.

Competition of Yellow Pine

Mr. John Donogh, Toronto, remarked that in his opinion it would be a good thing to have rules for the grading of hemlock adopted. But if the rules were to be effective it would be necessary for all the manufacturers to stick absolutely to the agreement to use the rules. As to the yellow pine, he believed that it came into competition more with red and white pine than with hemlock. Yellow pine was specified by architects for buildings because it was the only timber large enough at the present time with the exception of B. C. fir. No man could sell red pine or B. C. fir at the present prices of yellow pine. Yellow pine was to-day coming into competition all along the line in sawn lumber for interior trim and interior finish. It had been used all the way up the T. & N. O. Railway. If the government would impose a duty equal to the duty on Canadian lumber entering the United States it would to some extent give white and red pine a preference in Canadian markets. If the customs authorities were to strictly supervise the importation of yellow pine timbers and to see that they came in dressed on one side only, unless they paid a duty, it would be of much benefit to the trade. He had never seen anyone, moreover, who could even suggest to him why the phrase "dressed on one side only" had been included in the free list. This privilege seemed to have been abused in the West and it looked now as though it had probably been abused in Ontario also.

A few years ago when a deputation of lumbermen from all parts of Canada had asked the government to place a duty upon lumber, the western farmers and the Ontario manufacturers had opposed it and it had not been secured. He believed that the same opposition would be sufficient to-day to prevent the duty being imposed, in spite of the fact that lumbering was to-day practically the only unprotected industry in the country. Lumbermen paid a duty on everything used in the manufacture of lumber and they got no protection in

Yellow Pine as a Competitor of Hemlock

Mr. W. J. MacBeth disagreed with Mr. Donogh about yellow pine not competing with hemlock so strongly as with white and red pine. Yellow pine, he declared, was a strong competitor of hemlock. Its direct influence was in keeping down the prices of hemlock in the United States. The fact that the price was depressed on the other side forced a large amount of it into Canada and kept the prices down here at the same time. Take 2 in. x 12 in., 18 ft. to 24 ft. It could be bought in yellow pine practically as cheap as in hemlock here to-day. The Canadian lumberman should have some protection. If he had protection equal to what the United States lumberman had, he believed it would meet all the requirements.

The Demand for a Duty on Lumber

There was a movement on foot to-day, Mr. MacBeth stated, which was being carried forward by the Canadian Lumbermen's Association and which had for its object the securing of a duty upon lumber entering Canada. Mr. MacBeth explained the movement by reading the following circular which is being sent out to the whole trade in Canada, by the Canadian Lumbermen's Association.

"In view of the conditions regarding the lumber industry and the position which Canadian lumbermen have long been placed in, **sawn lumber and lumber planed on one side**, being admitted into Canada **free of duty**; the purpose of this enquiry is to ask whether or not you are in favor of the Canadian Government putting a customs duty on **sawn lumber** imported into Canada with additional duties when **further manufactured** to correspond with duties levied by the United States on Canadian lumber?

"All that we ask is to be put on an equal footing with the United States manufacturers."

The circular is accompanied by an addressed postal card upon which two questions are asked, first: "should duties be imposed upon soft woods?" second, "should such duties be imposed upon hardwoods?"

The circular also says:—"We want you to feel that in doing this you assume no obligation of any kind. This association is prepared to conduct the campaign, but we wish to know whether you are in favor of such a proposition, and if so, that we may count upon your hearty co-operation. The matter is of great importance to you and we hope to receive an early reply."

Speaking of this circular, Mr. MacBeth expressed the opinion that it would be better to leave the hardwoods and the soft woods separate. If they asked for a duty on hardwoods they would again enlist the opposition of the manufacturers. An assurance had been given by the lumbermen of Alberta and British Columbia that they would do everything in their power to assist in the movement. He believed that if the matter were taken up in a proper manner they had very good hopes that a duty would be imposed. He thought that it would also be best to do it through the Canadian Lumbermen's Association.

Considerable discussion followed upon this point, the gist of which was that all the members were heartily in favor of the proposal and that they might be depended upon to give it watever assistance they could.

A committee was then appointed to draw up grading rules and submit them to the meeting on Thursday. The committee consisted of the following:—Charles McGibbon, Penetanguishene; J. G. Cane, Toronto; W. J. MacBeth, Toronto; James Lauder, Toronto; R. B. Elgie, Toronto, and the Chairman, Mr. Norman Hocken, Otter Lake Station.

Those who were present at the meetings included the following:—Norman Hocken, Otter Lake Station; J. P. Newman, Wiarton; Charles McGibbon, Penetanguishene; John Donogh, Toronto; A. C. Manbert, Toronto; Alex. Robertson, Otter Lake Station; J. K. Muir, Toronto; H. J. Terry, Toronto; James Lauder, Toronto; R. B. Elgie, Toronto; R. J. Hutcheson, Huntsville; W. J. MacBeth, Toronto; W. W. Carter, Fesserton; and D. G. Cooper, Collingwood.

Hon. W. R. Ross is working on a new timber policy for British Columbia, and the amendments to be introduced by him in that connection are likely to be the most important of the forthcoming session.

Sash and Door Manufacturers Meet

American Competition, Price Cutting, and Lumber Grading Discussed—Cheap U. S. Doors Dumped in Canada

A meeting of the Ontario Sask & Door Association was held at the King Edward Hotel, Toronto, on Friday afternoon, November 17. The meeting was a representative gathering of the manufacturers of the province, among whom were noticed, W. D. Cargill, Cargill, Ont.; F. W. Brennen, of M. Brennen & Son Manufacturing Company, Limited, Hamilton; Grant P. Davidson, of James Davidson, Ottawa; R. A. Rastall, of Mickle, Dyment & Co., Brantford; R. Truax, Walkerton; E. R. Eaton, of J. R. Eaton & Sons, Orillia; F. Buchanan, of Lloyd & Buchanan, Wingham; H. Knight, of Knight Bros., Burks Falls; J. H. Hockin, of R. Stuart & Co., Guelph; Jno. A. Gray, of The Harriston Planing Mills; R. A. Laidlaw, of R. Laidlaw Lumber Co., Toronto; O. W. Rhyner, of Mickle, Dyment & Co., Brantford.

The president, Mr. W. D. Cargill in opening the meeting referred to the splendid condition of the trade at the present time. He spoke vigorously on the subject of price-cutting in the trade, but was glad to report that it was not so general as it was some time ago, being largely confined to one or two firms. They were shipping far more doors this fall than a year ago, and business during the year had been so good that there was absolutely no necessity to cut prices at all. He also touched upon the equalization of freight rates, and thought that if the manufacturers would all agree to pay the freight it would put all on an equal basis, where now they were not in a position to compete.

Mr. Buchanan was unalterably opposed to paying freight rates. He had been frequently asked to quote on rates f.o.b. the town from where the enquiry emanated, but had always replied that their rates were f.o.b. Wingham. He did not think the other way would work to the advantage of the trade.

Mr. F. W. Brennen spoke strongly upon the questions of price-cutting, uniform grading and the dumping of American-made doors on the Canadian market at prices lower than those in force on the Americanside. He thought the Canadian Sash and Door men should arrange to counteract this evil. Retail men should be urged to put in a stock of doors in the winter, as, when the rush season came, manufacturers found it hard to supply them and then they went to the States for stock. He stated that the American manufacturers were putting a low grade door on the market that could not come up to the Canadian made door, and the trade should be educated along these lines, and the people told through publicity, what class of doors these U. S. manufacturers were dumping in Canada.

Mr. Buchanan thought that the association should take the matter up with the Government and see that it was stopped. The American manufacturers were dumping doors of inferior quality in Chatham, Windsor, and the border towns at prices that Canadians could not manufacture for.

Mr. Truax stated that he had recently been at Sault Ste. Marie and made an investigation of this matter. He found that the same doors were being sold cheaper on the Canadian side of the Soo than on the American side.

Mr. Grant P. Davidson reported that on a recent trip through the eastern part of the province he had found No. 2 doors manufactured in Oregon being sold there for No. 1, at ridiculously low prices.

A resolution was finally adopted that the president appoint a committee of from three to five, with himself as one, to take up the matter of the dumping of American doors on the Canadian market, with the Government and ask for increased protection on doors.

Mr. Truax thought that they should approach the Minister of Customs first and see just how far these American manufacturers were dumping on Canadian ground.

The chair named Messrs. Buchanan, Cargill, Rastell, Truax and Davidson as a committee.

The discussion then reverting to the Universal price list in use by the association, Mr. Buchanan moved, "That we express our appreciation of the Universal price list, with current discount agreed upon at last meeting, and commend its use to the general sash and door trade." The motion was carried.

The question of lumber grading was then taken up by the meeting. Mr. Knight thought the question of lumber culling a very important one, which at the present time was in very bad shape. He thought it was up to the consumer to define the grades. He must know what grades he can use to best advantage and what he can pay. The lumberman doesn't know what the consumer wants and puts up just what he thinks will suit.

Mr. Truax thought that only in a few cases the sash and door manufacturers bought from the mill. They bought principally from the middleman, but he thought it would pay better to go direct to the mill.

Mr. Brennen believed that the sash and door men should insist upon getting the exact grade of lumber from the lumbermen. Unless they stuck together and thrashed these things out as an association they would never do anything.

It was finally decided that Messrs. Knight and Truax representing the association look into the matter of the grading of lumber and draw up some plan of getting lumbermen to grade and report it to the next meeting.

Mr. Pearce, editor of the Canadian Woodworker, spoke on the question of the standardization of matched stock and stock mouldings and after some discussion it was moved that the executive be notified to look into the matter of standardization of moulding and matchings.

Logging with Machinery in Ontario

Method Adopted for Transporting the Winter's Cut to Water—The Important Part Played by Hoisting Engines and Railroads

THE lumber manufacturers of Canada are at present busy with the commencement of their winter operations in the woods. No single end of the lumber business has more in it of interest than that of getting out the logs, and there is no branch of the business upon which more depends than upon the woods operations. The successful and economic management of the camps regulates more than anything else the prosperous conduct of a lumber manufacturing business. So thoroughly is this recognized among the manufacturers of to-day, that everything which will tend to cheapen the cost of getting out the logs is being closely studied, and the logging methods of to-day are rapidly undergoing important changes, which involve the application of scientific principles and the use of machinery in a manner which some few years ago would scarcely have been considered feasible.

1.—Logging in Northern Ontario—The Jack Ladder.

2.—Logging in Northern Ontario—The Double Drum Hoister.

3.—Logging in Northern Ontario—McGiffert Loader at Work.

4.—Logging in Northern Ontario—Another View of the Loader.

Chief among the branches of the logging business which have been undergoing these changes may be classed the work of loading the logs and transporting them from the bush to the water or to the mill. An interesting instance of this is afforded by the operation of the C. Beck Manufacturing Company, Limited, of Penetanguishene, Ont., whose logging operations are under the capable management of Mr. A. E. Beck, with headquarters at Sudbury, Ont. A series of views of the operations of this company in the Township of Creelman, Ont., is reproduced herewith, affording a good idea of the methods in use.

Mr. A. E. Beck, in a letter to the Canada Lumberman, refers to the work as follows: "Our log loading got along in a very satisfactory manner all summer in spite of the fact that it was our first attempt at railing logs and the work was new to most of the men. We loaded at three points and had four machines; two ordinary double drum hoisting engines, a McGiffert loader and a Jackladder.

"At mileage 288 on the C. N. O. we have a siding to a wide part of the Vermillion River, where we can hold logs and here we loaded with the Jackladder. Two cars are loaded at a time, one on a low level and the first wires put on and then moved on to the high level platform and topped off. The work of the men at the Jackladder is shown in view No. 1.

"At mileage 295 we have another siding to another wide part of the river, where we loaded the logs from camp No. 2, just below where they were dumped in the winter. Here we loaded with an ordinary double drum hoisting engine. One drum is used to lift the logs and the other for shifting the cars. We find this a very economical way of loading. The work of the loader at this point is shown in view No. 2.

"At mileage 292 we have had to build a two mile spur to Bessie Lake, which is in the centre of the township and where we dump the logs of three camps. We also dumped some logs along this spur which we loaded with the McGiffert loader. The McGiffert loader at work here, is shown in view No. 3. In this case it is loading from the ground. Another view of the same machine is given in view No. 4, in which it is shown loading from Bessie Lake. We also used a

5.—Logging in Northern Ontario—The Locomotive at Work.

double drum hoisting engine here on the other side of the bay. We used our own shunting engine on this spur. The locomotive at work is shown in view No. 5.

"A bit of the trestling on our line up a steep grade is shown in view No. 6.

"The logs are taken to Parry Sound on the C. N. O. and dumped from their dock and rafted to Penetanguishene. The work of dumping from the cars at Parry Sound is shown in view No. 7.

"During the summer we shipped about 2,500 carloads of logs."

This interesting description of the operations, by means of which logs are taken from an inland limit and delivered by a long rail haul at the water's edge, in an economical enough manner to permit of them being manufactured into lumber and sold in competition with lumber from logs which have only a water journey from the woods to the mill, gives one an excellent idea of the manner in which the use of machinery is increasing in the logging business. Beyond question its use is bound to increase as the limits near the water disappear.

Searchlights on Some American Industries

"Searchlights on Some American Industries" is the title of an interesting book which has just been issued by A. C. McClurg & Co., Chicago. The author is James Cook Mills who is also known as the author of "Our Inland Seas." In his preface the author clearly outlines the scope of the book. He draws attention to the fact that history has dealt far too much with the records of the overflow of kingdoms. This idea of history deals with the barbaric, and takes no account of a nation's intellectual and religious development, its arts and letters or its industrial progress and commercial expansion. Taking this thought as a maxim he has endeavored to collate facts and analyse the results procured by certain of the leading American industries, and to present clearly and conclusively the mechanical and economic aspects of their operation. An idea of the scope of the work may be secured from the fact that it deals with the following subjects: lumber, salt, sugar, paper, leather, moulding, graphite, and the achievements of the blind. The book is attractively published and contains illustrations.

Can We Save Vanishing Hardwoods?

Statistics Indicate Rapid Depletion—Correspondent Suggests Government Distribution of Young Trees

Editor, Canada Lumberman:—I note that in some of your recent issues you editorially advocate the imposing of a duty on "rough lumber" imported into Canada as a sort of offset to the duty imposed by the United States on Canadian rough lumber imported into that country. But surely you would not advocate placing a duty on hardwoods in the rough? Considering that our supply of nearly every variety of hardwood is rapidly diminishing, and that we have to depend largely upon the United States to supply our ever increasing demands, the imposing of a duty would simply increase the price to the consumer and benefit no one in particular. I do not, of course, refer to yellow pine in this connection, as that is not a hardwood, and it does seem to enter into competition with some of our native woods, such as white and norway pine, and hemlock, so it is not included in the above argument.

In your issue of November 1st, on page 39, under the caption of "Hardwood Resources of Canada Diminishing," it is stated among other things as follows: "Thus the value of the hardwoods imported into Canada during 1910 exceeded by fifty per cent. the value of the hardwoods manufactured into lumber." (Presumably by Canadian sawmills). Then again: "Nearly all of those imports are from the United States, and consist of the most valuable species; such as oak, hickory, tulip, chestnut, gum, walnut, cherry, etc." So that we are becoming more and more dependent upon the United States, whose available supply for export is surely and rapidly diminishing."

Now, sir, not only is our own supply of hardwoods rapidly becoming exhausted, but our demands are steadily increasing from year to year. Take the matter of oak, for instance; a few years ago our own native oak was equal to all the demands put upon it, mainly by the manufacturers of furniture, but since plain and quartered oak have entered so largely into interior finish, flooring, etc., we have to depend almost entirely upon the Southern States to supply the demand. According to the statistics published in your issue of Nov. 1 the total production of oak in Canada for 1910 was only 8,718,000 ft., in small lots, all over the country, whereas one firm making hardwood flooring and inside trim in this small town, use up fully half of that quantity themselves every year.

Now a question which naturally presents itself in face of the above conditions is this: Is anything being done, or proposed to be done, in the way of replacing by re-forestration our fast-disappearing hardwoods?

Not so very many years ago many valuable hardwoods, such as black walnut, butternut, chestnut, cherry, hickory, ash, etc., grew in plentiful profusion along the north shores of Lakes Erie and Ontario, and some varieties even as far north as Lake Superior, but these have been almost entirely cut out, and it will be only a matter of a few years when they will be utterly extinct. It is true we still have some maple and plenty of birch, a tree which thrives in a more northerly latitude than any of the others, but the uses to which it can be put are somewhat limited. Now it would seem that any scheme of re-forestration which does not include our hardwoods is necessarily imperfect, and falls short of accomplishing the purpose that should be aimed at, viz., the preservation and perpetuation of our forests, not only for the purpose of providing these valuable woods for the use of future generations, but also for the salutary effect they have upon the climate, and their influence, as we are told by scientists, on the rainfall, and the prevention of floods.

Now the question naturally arises, can the replanting of any or all of these varieties of hardwoods be made profitable so that private enterprise may engage in it? Of course, a land owner may think it of little use to put part of his land under a crop which will not mature for fifty years or more; by that time he will probably be dead; but supposing he has in his farm of one hundred or more acres, a few acres of such a nature as to make them of little value for any of the usual crops, why not plant them with some of the nut bearing trees; such as walnut, butternut, chestnut, or hickory? These will require little or no attention after the first year or so, while the nuts in a few years will be a source of revenue, and the trees themselves will be in the nature of a good investment for his family in future years, as good, and a great deal cheaper, than life insurance.

There are large tracts of land along the line of the Michigan Central Railway which by soil and climate are peculiarly adapted for the growing of all of the varieties of woods above mentioned. It is a matter which the government might well take up, make a special study of the matter, and embody the results in printed material to be distributed among the farmers and land holders. This might set forth the different kinds of trees adapted to certain soils and locations, the probable time required to bring them to maturity, and full instructions as to planting anl their subsequent care.

Our neighbors across the line are becoming alive to the importance of this subject. The State of Pennsylvania, which has a climate similar to Southern Ontario, has taken up this matter of re-forestration, and the State Government has established nurseries where the young trees are grown, and distributed at cost.

The State of Pennsylvania, which was once heavily stocked with both evergreen and deciduous trees, has, owing to the operations of the lumberman, been almost entirely denuded of her forests, and has just wakened up to the necessity of doing something to restore them, hence this action by the Government of Canada, and more especially the province of Ontario, is in an identically similar condition, at least as far as her hardwoods are concerned, and similar action by either the Provincial or Federal Governments would seem to be indicated. It is a matter that should be pressed home to the government. John McGregor, Meaford, Ont.

Grading and Inspection—How it Works

A Few Interesting Ideas Brought Out in a Discussion of the Question Between Two Members of the Trade—Would Abolish the Crooks

The salesman of a manufacturing company which turns out many million feet of lumber each year, dropped into a wholesaler's office in Toronto recently to pass the time of day and incidentally to suggest a sale of lumber. After a few minutes talk the inevitable subject of grading came up. On the wholesaler's desk at that time was a copy of a pamphlet recently issued by the "Canada Lumberman" dealing with the question of grading and inspection of lumber.

"Have you seen this pamphlet?" asked the wholesaler, as he handed it over to the salesman.

The latter took the pamphlet and looked it over carefully, gathering from a general glance at it that the proposal was to form a grading system for lumber and enforce it by means of inspectors. He looked rather sceptical and presently put the question, "How are you going to do it?"

"Well it's just like this," replied the wholesaler, a man who has entered enthusiastically into the proposal and who is doing his utmost to bring about a beneficial change of this nature.

"Suppose you take an order from a wholesaler. You both agree upon a certain class of lumber and you send the order to the mill. where it is filled, and the lumber is shipped. The wholesaler upon receipt of the stock may find that it is not what he ordered and he will make a complaint. The manufacturer looks up the shipper who tells him that the lumber was shipped according to the order as received from the traveller. The traveller claims that the order, as sent in, represented exactly what he was asked to supply. Somewhere between the wholesaler and the shipper at the mill there has been a misunderstanding and the result is the shipment of a lot of stock which is not wanted. The proposal is simply to place the case in the hands of a competent inspector who will take the order given to the traveller and the invoice of the stock and then examine the stock itself. Upon his decision will depend the settlement of the difficulty. There won't be any necessity for making radical changes in the generally recognized grading systems at present in force, at the mills. In a short time the whole matter will assume very definite shape and the trade will find that its business is being conducted upon safe business principles, instead of upon the present absurd system, which in reality is characterized entirely by lack of system."

The visiting salesman was at once convinced and replied "why yes that is alright and it would be a fine thing for the whole trade and industry if it could be put into effect.

"There are other troubles though, which require just as much attention," he continued. "The worst feature of the trade to-day is the presence of so many men on the road who carry around the lists of various manufacturers and who have no responsibility whatever. They seldom know anything about lumber and frequently know very little about the requirements of the trade, but they are clever talkers and can put through a sale in many cases where a more experienced man would not be able to do so. Moreover they would not hesitate to put through a sale even though they did not know whether they could furnish the grade of lumber required. Having no offices, except what they carry under their own hats, and being financially irresponsible, they take no risk in accepting an order whether they can secure the stock or not. They make enquiries at the various mills and perhaps secure the stock. If they do not secure it however, they try to get the nearest thing they can to it, and have it shipped, in the hope that it will fill the bill. Trouble arises at once when the stock is delivered and a salesman has the responsibility in a financial way he can simply ignore the trouble and shoulder the blame onto the mill, saying that they did not fill the order properly. If he cannot find any stock near enough to the order, he simply advises the customer to that effect and the latter has wasted his time and possibly lost the sale of the stock which he could have put through if he had been able to secure it. The trade ought to try to put these men out of business before they do anything else."

"Right you are," replied the wholesaler, "and the best way for the trade to do this is to adopt a plan for grading and inspection, such as is outlined in this pamphlet. If this plan is put into effect, men of this class will be put out of business. Not only will they be got rid of, but all the crooks also will have to quit.

"Now here is a case in point. It is not very long ago since a certain wholesaler gave an order for two cars of lumber and they were shipped from the mill. When the invoice came along he counted up the lumber on the cars and found that the figures of the invoice were quite correct. He took special care in counting the lumber because he had reason, from past experience, to doubt the business methods of the manufacturer he was dealing with. By chance, at that time, he was wearing his Sunday clothes and he put the invoice in the inside pocket. The coat was hung up in a cupboard that night and the next day when he thought of paying the bill he could not find the invoice. After a fruitless search he wrote to the manufacturer asking for a copy of the invoice.

"By return mail the new invoice was received, but the wholesaler believed, on looking it over, that it did not correspond with the former one. He said nothing however, for a few days and when the next Sunday came round he naturally found the original invoice in the Sunday coat. When he reached the office again he compared the two ivoices and found that the new one had just 1100 feet more of lumber charged for on each car than the first one; 2200 feet of lumber too much in all.

"He notified the manufacturer of the discrepancy and the reply he received was that the first invoice had been wrong. But he knew his man too well and refused to pay for the difference. The manufacturer threatened to sue him and he told him to go ahead and sue, knowing that he would never face the exposure which was probable. That was the last order from this particular wholesaler to this particular manufacturer.

"Now that kind of business will be prevented also, by a grading and inspection system such as proposed. No manufacturer and no other member of the trade, realizing that the details are liable to to be inspected by an impartial inspector will take such chances as these.

"In fact every class of crookedness which is prevalent in the lumber business to-day can be greatly reduced in this manner. The raising of grades, another serious trouble will be impossible. Take it all round, it is difficult to see why such a plan should not be adopted. The only wonder is that the business has struggled along to this late date without having adopted it."

"I agree with you entirely," said the salesman, "and I am with you heartily in the movement. By the way can I sell you anything to-day?"

"I guess you can, if you will keep the grades and the amounts alright," said the wholesaler with a smile and a few minutes later the salesman left with a tidy order in his pocket.

It is reported from Vancouver that E. C. Atkins and Company, saw manufacturers of Indianapolis, Ind., and Hamilton, Ont., will establish a branch factory in Vancouver, with Mr. W. C. Birdsall as manager and Mr. A. F. Arnett as assistant manager.

The Manufacture of Flour Barrels

Description of Methods Adopted by Large Flour Milling Company—Ingenious Machinery Simplifies Work

From start to finish the process of making flour barrels is carried out by means of ingenious machines, which allow of very economical and rapid production, of which of course the consumer, in the end, receives the benefit. At the cooperage plant of the Glenora mills of the Ogilvie Flour Mills Company, Ltd., Seigneurs street, Montreal, 1000 barrels are turned out daily. The staves are bought in bundles of 60 each; every stave is 28½ inches long, and ⅝ inches smaller at the point than in the centre. After being dried the staves are sent to the adjustable setting-up form, in which 17 staves are placed in position. An iron hoop is placed around the lower portion of the staves and the workmen with a brisk shake welds them together. The next process is to windlass the slack barrels which is done with a windlass rope placed on the the upper portion of the barrel; this, operated by a machine, draws the staves together without twisting them out of shape. In the automatic form the rope is released and drawn back, and the machine is then ready to receive another barrel.

The barrel is then practically formed, but it has to undergo other processes before it is complete. One of these is the heating, done by placing the barrel over a heater, cylindrical in form, and made with a corrugated cast iron fire-holder and an outside sheet-iron casing. Afterwards the wooden hoops are put on by a driver. The barrels are placed on a plate resting on springs and the hoops are forced on by iron arms so arranged that each automatically performs its part and drives the truss hoops evenly all round the barrel at the same time. The hoops are 1⅜ inches wide, and ⅜ of an inch thick on the one side and a quarter of an inch on the other. One man can turn out from 1,500 to 2,000 barrels per day. Prior to being placed under this driver, or trussing machine, any irregularities in the shape of the barrel are rectified by the workman, who with a hammer goes over the surface while it is yet warm.

Chamfering and crozing follows, both ends being finished at the same time; each machine is furnished with chuck rings, and has a capacity of from two to three barrels a day. The heading up and hooping off is also done by machinery, the machine being automatically fed by an arrangement which receives an entire package of heading at once and feeds the heads as required. The latter are in three pieces, half an inch thick, and 17⅛ inches in diameter. The heads are fitted tightly, the iron arms which close around the barrel giving it a more compact appearance. The head hoop is placed on next, and the product is finished, except as a last touch, strips of hoop are nailed around the outside of the head in order to keep it water-tight. The strips thus utilized are scraps of the hoops for the body of the barrel. These hoops are nailed together by boys operating a machine known as a wood-hoop nailer, a very simple mechanism capable of nailing 1,500 to 2,000 per day.

The machinery is not very elaborate in a cooperage plant dealing with, say, flour or sugar barrels, but in shops manufacturing various descriptions of barrels many more appliances are required, and the work is to that extent more complicated. The accompanying illustrations give good ideas of two of the machines in the Ogilvie mills.

Heading Up and Hooping Off Machines with Automatic Heading Feeder.

Machine for Chamfering and Crozing Slack Barrels.

Competition from U.S. May Close Large Alberta Mill

It is reported from Strathcona, Alta., that Mr. John Walter, the largest lumberman of the district, announces that he will in all probability make no preparation this coming winter for sawing lumber during the summer of 1912, at his two big mills in the Twin Cities. This means that he will not employ the customary large number of men to operate the logging camps up the river this winter and it also means that the lumbering business will be quiet at the local mills next year.

"I have never yet cut lumber without a profit," said Mr. Walter, "and consequently, when I find that the product of American mills is being shipped into the prairie markets to the east at a price no higher than the logs cost me delivered at my mills here, I feel that I cannot go on operating at a steady loss." Mr. Walter says the lumbermen of Washington and Oregon have accumulated a great surplus of mill products during the last year or so, and are anxious to open a market for their material on the prairies of Canada. With this object in view they are laying down lumber at Saskatchewan yards at prices as low as $13 per thousand, which Mr. Walter frankly admits he cannot begin to meet without serious losses.

"I don't think that we will cut any logs for lumber this winter," he said, "but will continue taking out railway ties. This year we got out about 40,000 ties and will endeavor to get far larger contracts for next season. This work is cash, while the lumber business is largely credit, at its best."

Operating steadily this season with a capacity of 150,000 feet daily, the two sawmills of John Walter, in Strathcona and Edmonton, have cut a vast quantity of lumber since the river opened last spring, and the greater part of this lumber lies in great piles in the two yards. Fifteen million feet came from the saws during the summer, so that the store now on hand will not doubt suffice to supply the local demand for some time to come.

Pacific Coast Merger Making Progress

Lumbermen representing many of the largest tidewater mills in Oregon and Washington conferred recently at Portland, Ore., with Henry J. Pierce, of Spokane, relative to the proposed combination of cargo mills. It was announced that the organization plans had made such progress as to insure sucess of the consolidation scheme. Notifications were started for the acquirement of sufficient timber to meet the demands of the project. The next step of the organizers will be to submit the question of the legality of the combination to the attorney-general of the United States. In response to a question of whether the project did not violate the Sherman anti-trust law, Mr. Pierce declared that the proposed combination contemplated only the plan of placing the lumber industry on a prosperous basis. He quoted from President Taft's Chicago speech "that there is a vast difference between uniting plants to regulate the cost of production and unity to suppress competition, to restrain trade and to control prices."

The Lumber Trade in Eastern Canada

G. T. P. Entering the Field as a Timber Carrier—Sale of Gibson Brothers' Property — Lumber Company Wins Insurance Claim

The Lumber Merchants' section of the Retail Merchants' Association of Canada, Montreal, have been in correspondence with the Lumber Merchants' Section of the Toronto branch, with a view to co-operating on the questions of the inspection, grading and measurement of lumber. As a result, it has been decided that a deputation from the Montreal section shall visit Toronto early in December in order to fully discuss various aspects of the question.

Will Use G. T. P. for Hauling Lumber

The G. T. P. through New Brunswick will be used for the first time for commercial purposes this winter when D. Fraser & Sons, of Plaster Rock, will haul a cut of 10,000,000 feet of lumber over the line from their timber land on the Odell stream to their mill at Plaster Rock. The C. P. R. will furnish the motive power and will run two trains a day over fourteen miles of the road. When the Tobique Valley branch is met at Wapske the trains will run direct to the mill. The cut is a special one and the order was accepted only a few days ago. In addition to that the firm will turn out their usual supply of lumber.

Gibson Brothers' Property Sold

Gibson Bros., Northampton, N.B., have sold their valuable lumber properties to a joint stock company, of which Chas. Rogers, John Gibson, Gordon Neal and M. L. Hayward are members. The property consists of a block of 1,200 acres inside of Bull Lake, heavily timbered with fine spruce and hardwood, a block of land at the rear of the river, lots consisting of 500 acres finely timbered with spruce, various other smaller lots of spruce and cedar the stumpage on the river lot of 450 acres timbered with a mixed growth and the timber rights on 5 miles of the N. B. L. Co. The mill and water power rights also go with the above. The reported price is about $30,000. The company will improve the mill and water power, and lumber on a large scale.

Death of David S. Cowles

The death is reported at Rye, N. Y., of Mr. David S. Cowles, president of the Pejepscot Paper Company. Mr. Cowles was widely known in Quebec and New Brunswick through his connection with the Pejepscot Company which has extensive timber lands in Quebec and on the North Shore of the Bay of Fundy at Salmon River, N. B. The late Mr. Cowles was in his fifty-fifth year. Death was due to pneumonia.

Charles P. Cowles, brother of the late David S. Cowles, president of the Pejescsot Pulp & Paper Co., reports that the policy of the company as regards its New Brunswick interests will not be changed in the slightest by his brother's death. The plans for extension including the building of a new mill at Martin's Head, will be carried out. Justus Cowles, of New York, another brother, who was vice-president of the company prior to the death of D. S. Cowles, has been elected president.

Lumber Company Wins Insurance Claim

An interesting case was recently decided at Dalhousie, N. B., when Guimond, Couillard Freres & Cie, and La Banque Nationale were awarded the full amount of their insurance claim against the Fidelity Phoenix Company. The lumber firm and bankers were suing the Fidelity Phoenix, Western, Commercial Union, London Norwich Union, Liverpool and London and Globe and Manitoba Assurance Companies. The amount of insurance was $51,000; the loss claim $48,407.01, for birch, spruce and pine lumber piled in Guimond & Company's yard at Campbellton and burned in August, 1910.

The defendant companies set up the defense of arson and also took advantage of all the numerous technical objections that the number of policy conditions render available.

The case against the Fidelity Phoenix Company was begun on September 26 last and occupied all that week, was adjourned until the 19th inst. and a verdict only reached on Saturday morning.

M. G. Teed, J. H. A. L. Fairweather, A. E. G. McKenzie and W. M. Jarvis represented the assurance companies and Hon. J. D. Hazen and Fred. R. Taylor appeared for the plaintiffs.

In addressing the jury Mr. Teed stated that he did not ask for a finding of arson as there was not sufficient evidence. Questions were left to the jury but owing to the company having taken advantage of and pleaded every policy condition forty-one questions were required.

All of these were answered in favor of the plaintiffs and a verdict was entered against the Assurance company for the full amount claimed with interest from the 6th of December, 1910, the time when the loss was payable.

Testimonial to Mr. E. E. Tache

The presentation of an address and testimonial to Mr. E. E. Tache, deputy Minister of Lands and Forests for the Province of Quebec, by his colleagues of the Civil Service, was made the occasion of a notable demonstration at Parliament House recently. It was attended by the entire civil service of the provincial capital, and by the Lieut.-Governor, Sir Francois Langelier; Sir Louis Jette, Sir Lomer Gouin, and Senator Choquette. Mrs. Tache was the recipient of an amethyst brooch surrounded by pearls. The presentation to Mr. Tache consisted of a set of bronzes. The presentation address, which referred among other things, to the many permanent works of which Mr. Tache was the architect and designer, and to his half-century of labor in the civil service, was read by the Hon. Boucher de la Bruere, Superintendent of Public Instruction. Mr. Tache made a feeling reply, and congratulatory speeches were also made by Sir Francois Langelier, Hon. Mr. Allard, Minister of Lands and Forests, and Sir Lomer Gouin, the last-named reminding Mr. Tache of the magnificent monument he had erected for himself in the Parliament House, which was his own design.

Timber Measured at Quebec

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers, Quebec, under date of November 7:—

	1909 Cubic ft.	1910 Cubic ft.	1911 Cubic ft.
Waney White Pine	733,240	479,280	757,840
White Pine	57,520	10,720	10,680
Red Pine	8,680	21,920	27,720
Oak	537,160	256,680	92,080
Elm	107,960	246,920	221,680
Ash	520	1,360	120
Birch and Maple	57,240	43,120	62,320

Free Pulp and Paper Causing Agitation

Active agitation both in support and in opposition to the free entry of Canadian pulp and paper into the United States, is developing in various quarters. The Home Market Club of Boston is opposing free entry and has adopted the following resolution:

"Whereas, woodpulp and print paper have been placed on the free list, so far as Canada is concerned, notwithstanding that the expected concessions on the part of Canada have been denied us, and

"Whereas, demands are now being made under the favored-nation clause by all paper-exporting countries for the same tariff privileges which have been extended to Canada; be it

"Resolved, that we protest against this unjust treatment of American paper manufacturers and respectfully petition congress to repeal this concession."

Secretary Marvin, after the adoption of the resolution, pointed out that in 1906 and 1907 the paper producing countries of Europe, led by Norway, Germany, the Netherlands, Austria and Great Britain, had a surplus for export amounting to $337,127,000, or nearly twice as large as the entire paper and wood pulp production of the United States.

The American Newspaper Publishers' Association on the other hand are working vigorously to maintain the free entry and to have its privileges extended to other countries.

Important Merger at Truro, N. S.

Messrs. R. F. Atkinson, A. W. Gilroy, D. R. Lamy, J. R. Douglass and J. C. Purdy, all of Amherst, N. S., who have been carrying on an extensive lumbering business for some time under the name of the Salmon River Lumber Company, with head office at Truro, N. S., have bought the lumber properties owned by the Anthony Lumber Company, South Maitland; and that of the Springhill Lumber Company, and the Beaver Lumber Company, Kemptown, Col. Co. Messrs. R. B. Atkinson and A. W. Gilroy are the managers of the new company, which will employ some 200 men operating their different lumber areas. The new company will be known as The Atlantic Lumber Company with headquarters in Truro, and office in the Bank of Nova Scotia building. It is reported that the cut this winter will be in the neighborhood of some 18,000,000 of lumber. At Springhill there will be an output of 2,000,000, 11,000,000 at Salmon River and at South Maltland and Shubenacadie fully 5,000,000.

Liverpool Trade Uneventful

Messrs. Farnworth & Jardine, Liverpool, Eng., in their wood circular dated Nov. 1, say:—The business during the past month has been uneventful. The arrivals have not been too heavy, but the deliveries in the aggregate have been disappointing compared with corresponding period last season. Stocks, as a rule, are fairly moderate, and values generally steady. Ocean freights continue on a higher basis, and tonnage from the spruce ports difficult to obtain.

Canadian woods.—Pine timber.—Of waney 1st class which has been imported freely to Manchester, about half has gone direct into consumption; stocks are not heavy, values rule high. 2nd class—Only a very small quantity of this description imported; stocks are moderate and values steady. Square pine has not been imported, the demand continues very limited, and stock is light. Red pine has not been imported, and is seldom enquired for. Oak.—The import of 9,500 feet has been to Manchester, and goes into stock; there has been no import to Liverpool during the past month, and deliveries have been small; there is no change in value to record. Elm has not been imported during the past month; demand has been nominal; the small stock is firmly held. Pine deals have been imported to about an average extent; there has been a fair consumption; stocks however are ample, and values unchanged. Red pine deals have been imported moderately, but in sufficient quantities for the requirements of the trade; stock are not excessive. Siberian pine has not been imported during the past month; further deliveries have been made from the stock recently imported.

New Brunswick and Nova Scotia spruce and pine deals.—The import to the Mersey during the past month (including Manchester) amounted to 10,960 stds. compared with 8,460 stds. during the corresponding period last year; the bulk of the import discharged at Manchester; deliveries have been fair, amounting to 9,100 stds. against 11,750 stds. last year; c.i.f. values have slightly advanced, but tonnage is scarce, even at the advanced rates. Pine deals have not been in active demand, and values are practically unchanged.

Birch logs.—The import both to Liverpool and Manchester has been light; fair progress has been made with deliveries; stocks are not excessive, but sufficient for the present demand, and values are unchanged. Planks have reached the market freely, almost equally divided between Liverpool and Manchester; there has been a fair delivery; values are steady.

Small Trade at London

Messrs. Churchill & Sim, London, Eng., in their wood circular dated Nov. 2, report the following stocks of timber from St. Lawrence ports as compared with those of a year ago:—Pine deals 1911, 307,000 pieces; 1910. 494,000 pieces; spruce deals 1911, 693,000 pieces; 1910, 940,000 pieces; birch planks 1911, 266,000 pieces; 1910, 257,000 pieces. From New Brunswick the figures are as follows:—Pine deals 1911, 46,000 pieces; 1910, 52,000 pieces; spruce deals 1911, 397,000 pieces; 1910, 512,000 pieces; birch planks 1911, 230,000 pieces; 1910, 297,000 pieces.

Regarding trade conditions they report as follows:—"The importation of pine deals was on a very small scale indeed during October, and the stock is considerably lower in volume in consequence. Wholesale prices remain unaltered, but owing to the small supply, retail values for dry stock of reliable quality are inclined to stiffen. The supply of spruce was in small compass also, and prices improved during the month. Birch planks have been sold more freely at something over September rates, but the position of oak, birch and elm timber is unaltered, while the stock of ash seems to have almost disappeared."

Moderate Waney Impdrt at Liverpool

Alfred Dobell & Company, Liverpool, Eng., in their Timber Market Report, under date of November 1st, say: Canadian woods—Waney board and square pine—There has been a moderate import of waney with a good consumption at firm prices. There were no arrivals of square. Oak—Two contract parcels were discharged in Manchester which are going into consumption. Quotations unchanged. Rock Elm—Stocks are light, values very firm. Birch—Logs—The consumption more than absorbed the import. Prices are firm. Planks arrived somewhat freely. A steady consumption prevailed at unchanged quotations. Pine deals and boards—There was a moderate consumption. Prices were very firm with a slight advance for the better qualities. New Brunswick and Nova Scotia spruce deals—The arrivals were 2,500 Standards in excess of the corresponding month last year. The consumption figures may be regarded as satisfactory. Stocks are within reasonable compass.

Timber Trade at Barbados

S. P. Musson, Son and Co., Barbados, B. W. I., report under date of Nov. 11th, regarding the lumber market as follows:—White pine.—There have been no arrivals of this description of lumber during the fortnight, but we understand two cargoes are on the way. Spruce.—The Schr. "Basile" arrived on the 30th ult. from Belliveau Cove to our address with 124 M ft. which we had sold at $25 for merchantable, and $21 for a second quality. She also brought 16 M ft. spruce and hemlock plank which we sold at $22.08 round, and 19 M hemlock board for which we obtained $16.73 round. The Schr. "Mina German" arrived on the 8th inst. also to our address with about 120 M spruce and 16 M ft. spruce scantling which we had contracted for sometime ago. She also brings 23 M ft. hemlock which has not been sold. P. Pine.—The S. S. "Frednes" arrived on the 2nd inst. from Mobile, with 125 M. ft. which had been previously contracted for. Shingles.—The only receipt is a small lot 6 M long spruce ex "Basile" which we sold at $2.64. The demand for Longe Gaspe continues good. Shooks.—We have to report the arrival of 4-mstd. Schr. "Lewis H. Goward" from Portland, Me., to selves with 18,629 bdls. Hhd. shooks, and 864 bdls. Bbl. shooks, part cargo to neighbors. The Hhd. shooks were sold some time ago at $1.95 for oak and $1.85 for hardwood. Wood hoops.—Receipts consist of 350 bdls. imported on dealers' account.

Personal News of Interest to Lumbermen

Mr. P. D. Gordon, of Mason & Gordon, Montreal, recently returned from a five weeks' business trip to the South.

Ralph Loveland, of Loveland & Stone, Cutler, Ont., visited Toronto recently was a welcome caller at the office of the Canada Lumberman.

J. L. Campbell, of Campbell & Johnson, Toronto, paid a visit of a few weeks' duration recently to Winnipeg, and while in the West visited his various interests in the prairie province.

Mr. E. Stewart, forest engineer and dealer in timber limits, has recently returned from British Columbia and announces in this issue that he has taken offices at 84 King street east, Toronto.

Mr. W. K. Grafftey, of the Montreal Lumber Company, president of the Montreal Lumber Association, addressed the Montreal Builders' Exchange on November 29th, on the subject of "Lumber," at their noon lunch and talk.

Mr. William Rutherford, of William Rutherford, Sons Company, Limited, of Montreal, was chairman of one of the eleven committees of prominent Montrealers engaged in raising $1,500,000 for McGill University.

In the bye election recently held in the County of Digby, N.S., to fill a vacancy in the Local Legislature, Mr. H. H. Marshall (Con.), was elected. Mr. Marshall is a well-known lumberman, and he secured a majority of 500 over his opponent, Mr. A. E. Wall.

J. A. Heise, the well-known lumberman, of Stouffville, Ont., is enjoying an extended trip in California and also through the Canadian Northwest. He expects to be away about six months, and during that time hopes to fully recover his health, on account of which he decided to spend the winter in the south.

The Lieutenant-Governor of Manitoba, Mr. D. C. Cameron, the well-known Winnipeg lumberman, paid a visit recently to Toronto on his way through to Port Colborne. He spoke enthusiastically of the immigration into Manitoba during the present year, which, he stated, was greater than in any previous year of its history.

Mr. J. H. Poulin, secretary and manager of the Eagle Lumber Company, Montreal, has resigned to take up the appointment of general manager of the Richelieu Lumber Company, Montreal. The latter company have engaged a suite of offices in the Dominion Express Building, and propose to develop their business on a considerable scale early next year. The directors of the Eagle Company have passed a resolution expressing appreciation of Mr. Poulin's services.

W. J. Bell, Sudbury, Ont., vice-president of the Spanish River Lumber Company, and B. W. Arnold, Albany, N. Y., president of the company, were visitors to Toronto recently, where they met to discuss the company's business at its newly acquired yard at

Point Edward, near Sarnia, Ont. Harry Turnbull of Sarnia, manager of the new yard, was also present to confer with the officers of the company.

Messrs. Grant P. Davidson, A. G. Rose, and L. Henderson, together with the Toronto General Trusts Corporation, have been appointed trustees for the estate of the late James Davidson, the well-known lumber manufacturer, of Ottawa, Ont., who died suddenly several weeks ago.

Mr. Grant P. Davidson, who takes over the managership of the business of his late father, has for some time past been actively connected with the firm as travelling representative, and in that position has been brought in close contact with the trade throughout the country, understanding its requirements in a manner which will serve him to splendid advantage in his new position.

This firm, which has one of the largest and most up-to-date sash and door factories in Ontario, enjoys a large and growing trade. Under the new management it will without doubt continue to make rapid increases in business.

CAMP DEPARTMENT

A Canadian Forest Survey

By James W. Sewall

During the last winter it fell within the province of the firm of which the writer is a member to map and estimate some two hundred and thirty square miles of timbered land in the province of Quebec on the Rivers a Mars, du Moulin, Cyriac and Moncouche, which enter the River Saguenay near the town of Chicoutimi, below Lake St. John. This would have been a simple piece of work were it not between the first of February and the first of May, namely three months, which, in fact, coming spring shortened to about two and one-half months.

As soon as the work was definitely decided upon an office was established at Chicoutimi, a town of some six thousand people; this office served as a draughting room, and as the headquarters for hiring and paying men, as well as for a central bureau where the field crews obtained information and ordered supplies. By telephone this office was connected with the depot camps of the Chicoutimi Pulp Company (for whom tthe mapping was done), these depots being by chance strategically located for the purposes of the survey; at them, the pulp company furnished supplies, thus doing away with considerable cartage. They are located on the River du Moulin and on Lac des Ilets, on the northerly end of the mapped territory.

Our field force of some forty-five men was divided into three parties, at one time augmented by a fourth party of sledding. The magnetic needle was used in all surveying, and the calipered strip system in obtaining estimates. The duties of the parties were immediately laid out, and very few variations from the first plan of campaign occurred.

How the Parties Were Allotted

Party No. 1 was a surveying crew only. On it fell the reconnaisance and boundary work of a large part of the job. Starting from the Chicoutimi Pulp Company depot at Lac des Ilets it was hauled by team nine miles, hand sledded some eight more up the River Cyriac valley, and began its survey by running a boundary line eastward toward the River du Moulin; on reaching the du Moulin it used the stream as a base on which to haul supplies, and continued running a watershed line about this latter river; after reaching its head it hauled across the divide into the River a Mars valley, and ran a watershed line around the head of that river. At its final point it was some forty-five miles from the depot, about thirty-five miles of which were covered by hand-sled.

Party No. 2, a surveying and estimating crew, started at the mouth of the River Moncouche, ran a stadia traverse from there to the starting point of Party No. 1 on the Cyriac, returned to the Lac des Ilets depot, shifted itself, and ran a base line twelve miles southerly from a point near said depot, thereby intersecting Party No. 1's first line. By the time it had begun its course south, certain work had already been done by Party No. 3, so that Party No. 2 could, also, using its line, as fast as run, as a base, send out caliper crews east and west, and cover an allotted territory, exploring and surveying at one haul. Incidentally, hauling on hand-sleds was the big problem of the work, where supplies had to kept in to rapidly moving crews far from their base. After reaching the line of Party No. 1, Party No. 2 followed up the River du Moulin, resolving itself into a calipering party entirely, covered the territory already bounded by Party No. 1, followed that part into the Mars shed, and covered that territory. Party No. 2 kept in connection with the base of supplies, continually pushing sled loads inland toward No. 1, so that No. 1 could send men back and draw from the caches so established; by this means a good sled beat from the Lac des Ilets depot to the farthest point surveyed, with hauling in separate average lengths, was made and held open.

Party No. 3, also a combination line and estimating party, ran an arbitrary base line from the Lac des Ilets eastward to the River du Moulin, re-stocked at that river's depot, turned, and ran southerly to a line already established by Party No. 1, thus bounding a part of the tract it was to estimate; on the Party No. 1 line it set itself over and ran back to the first base line, estimating at the same time it made line.

After each of these parties had completed the above mentioned work they reported to the Chicoutimi office, and were turned onto the final tract, a small area nearer the village. So well did all plans work out that there was not a week's difference in the ending of the surveys of the three parties, and by massing the men on this last area the contract was easily completed just before soft snow made travelling almost impossible.

Advantage of Experienced Woodsmen

As may be inferred, the men in charge of the different parties were depended on to push ahead their respective works, without any immediate supervision of detail. The firm was enabled to do this by reason of having experienced men who were familiar with woods conditions in the State of Maine—conditions which resemble those of Quebec to a great extent. Without these efficient men in charge the speedy carrying out of the contract with any degree of exactitude would have been impossible. This enabled the writer, in general charge, to devote himself to travel among the parties, and to office work.

As before stated, hauling, that is, the question of supplies, was the most difficult problem, increasing as each party got farther from its base. Five sled-men to each party were kept busy, and at times this number had to be consiledably increased. The sleds used were made with spruce board sides, runners of iron, and hardwood rounds, securely bolted from side to side and from runner to top, this being the construction of the ordinary Maine moose-sled. It behooves the purchaser to look over his sleds carefully; they are subjected to hard usage, and unless well and properly built will be a source of continual vexation and delay. The dimensions of the best sleds we had were: length six feet, width sixteen inches, height six inches, width of iron runner three inches, thickness of board sides one and one-eighth inches, the rounds six inches apart. The sides must be solid, not built with standards, as bushes will catch in the open spaces, if such are left, and retard progress. A sledman, on ordinary going, on a snow-shoe trail well beaten down, can haul from 150 to 200 pounds a fair day's travel. The snow-shoe trails should be well marked by bushes stuck in the snow, wherever open places subject to winds are encountered.

We adopted the short round highland snowshoe, using lamp wick for thongs. We found the local shoes of this type satisfactory in model but not strongly enough made for survey work. The dimensions of the average shoes are: length two feet seven inches, and width one foot eight inches, with close mesh. If one would have some reliable maker follow this model he would obtain an almost ideal shoe for surveying work, especially in hilly country. The trouble with the Canadian shoes was in the inferior quality of the bows.

Ordinary wall tents (without flys) of ten ounce duck were used, one for the men and one for the chief of party with his American help. As a rule the cook also stayed in this latter tent. At first a third tent for wangan was carried, but these were soon given up on account of bulk and weight. Everything possible was sacrificed to lightness and compactness, as so much moving over steep long hauls had to be made.

We used the regulation box stoves, those made with a small oven for cooking purposes. So far as these latter, with ovens are concerned, a better arrangement is the one found in Maine, where box stoves are made with a rod across the top, on which are hung the ordinary open bakers for ovens. The ovened stove has of necessity a small fire box, which is, to say the least, a nuisance on cold wet nights. With the simple box stove, pitched on six feet of snow, after the tent was well boughed down, we were warm and comfortable. Cold was not a hardship to be reckoned with, outside of a nipped nose or ear now and then.

Sleeping bags are not so satisfactory as the ordinary lumberman's spread, 'and are much more expensive. Mr. Lyford, of the Riordan Paper Company, informs me that he uses down robes with gratifying results. These latter are expensive, but would be recommended for the heads of the party and their chief assistants. The native help in our district furnished their own blankets.

The Provision List

Our provision list has been reduced to the following statement, per man, per week. It is based on about 6,000 meals, and we think fairly reliable for winter work, when meat can be taken and kept indefinitely by freezing.

Allspice	lbs.	.001	Matches	gross	.03
Baking Powder	lbs.	.18	Onions	lbs.	.27
Beef (fresh)	lbs.	5.32	Oatmeal	lbs.	.10
Beans	lbs.	1.82	Pepper	lbs.	.02
Bread (frozen)	lbs.	1.25	Prunes	lbs.	.48
Corn Meal	lbs.	.14	Potatoes	lbs.	3.64
Cheese	lbs.	.95	Peas	lbs.	.59
Cream o' Tartar	lbs.	.06	Pork (salt)	lbs.	1.30
Cassia	lbs.	.003	Pork (fresh	lbs.	2.75
Candles	lbs.	.76	Pickles	gals.	.02
Dried Apples	lbs.	.45	Rice	lbs.	.12
Flour	lbs.	4.85	Raisins	lbs.	.24
Ginger	lbs.	.007	Soda	lbs.	.07
Hardbread	lbs.	1.78	Salt	lbs.	.36
Kerosene Oil	gals.	.01	Sugar	lbs.	2.13
Lard	lbs.	.65	Soap	bars	.19
Mustard	lbs.	.015	Tea	lbs.	.17
Molasses	gals.	.10			

All payments were made from the Chicoutimi office, no time or supply bill being honored unless countersigned by a chief of party. For time slips a printed, non-negotiable form, showing the payee's name, time, and amount due, less credits, was used. This at the same time constituted a receipt to be signed by the payee. Inventory and requisition sheets were furnished the men in charge, on which they listed all supplies and outfit taken, received or returned. By this method a fairly accurate check was obtained on purchases. Moreover, a ledger account of articles against each crew was possible, whereby the Chicoutimi office was enabled to locate and tell the number of all articles in the field. Credit was given on this account as articles were returned, and if not returned the articles were charged against the loser.

The magnetic needle answered our purpose well (barring scattered local attraction) for the surveys. We found the most expedient method of making traverses to be with transit and stadia, employing two rodmen.

While the trip system of estimating gave satisfactory results, we should recommend hereafter the evenly distributed sample plat, as being less cumbersome, allowing more time for looking up bunches of timber and topographical details, and permitting less opportunity for errors in acreage measured. In our strips we used the ordinary four man crew, taking topography at the same time as estimates. The aneroid barometer, checked by level lines, gave the contours, a fifty foot interval being employed.

The Lessons of Experience

Naturally with a new country, a comparatively large crew, and necessary haste in the completion of the work, a certain amount of waste, both in effort and expenditure was made. The survey, as a whole, confirmed and taught several things, namely:

(1) Experienced men to take charge of all field parties, on a survey covering large areas, where immediate supervision cannot be had, are an absolute necessity. The men who had charge of the three parties of this survey were K. McR. Clark, of Boston, Mass., James A. Conners, of Old Town, Me., and O. A. Wakefield, of Andover, Me., L. J. Freedman, of Houlton, Me., handled the office.

(2) The smaller the crew and the longer the time taken, the better and cheaper will be the work.

(3) Country far from the base of supplies, especially where canoeable streams are few, will best be attacked in winter.

(4) Transportation of supplies is the great problem; a native boss sledman can obtain the best results from the haulers, but he must be trustworthy and interested in the work.

(5) The sample plat is preferable to the strip system in mapping and estimating large uncontrolled areas.

(6) A definite head of affairs with final authority must be within easy reach, to decide changes in plans, and direct the general course of the work.

Cowichan Lake Project Progressing

It is reported that next year will witness the initiation of logging operations on the fifty thousand-acre tract in Cowichan Lake district, Vancouver Island, B. C., acquired from the E. & N. Railway two years ago by the American Finance & Securities Company of New York. Mr. E. B. Kurtz, president of the company, after a visit to the limits, arrived in Vancouver recently. Ownership of the tract is now vested in the Empire Lumber Company, a subsidary corporation with a capitalization of $7,500,000. Mr. Kurtz, who is a prominent figure in New York financial circles, states that with the completion of the Cowichan Lake branch of the E. & N. Railway the Empire Lumber Company propose to build standard guage logging railways through their limits. Logging camps will be established at various points and the output sold in the open market for the first year pending the construction of a sawmill at Osborne Bay on the east coast of Vancouver Island. This plant will be built on the unit plan, it being the intention to ultimately increase its capacity to a total of 100,000 feet a year. The logs will be shipped to tidewater over the E. & N. branch now under construction and a spur several miles long will have to be built to furnish connection with the proposed mill.

Mr. Kurtz is confident that the company have secured one of the best tracts on the island. The timber consists principally of fir. Mr. Kurtz was met at Vancouver by Mr. W. E. Marsh, of New York, president of the Empire Lumber Company. Mr. Marsh has been identified with the lumber industry all his life. He will leave shortly on a trip to the limits. Mr. Kurtz stated that their investment on Vancouver Island would ultimately run into a good many million dollars.

Judgment Reserved in Lumber Dispute

Judgment has been reserved by the Supreme court at Vancouver in the appeal of the Wattsburg Lumber Co. versus the W. E. Cook Lumber Co., an action in which the plaintiffs recovered heavy damages for the loss of a boom. The manager of the defendant company had applied to the plaintiffs for the loan of some boom sticks and they were loaned on condition that the defendants brought their tug and moved a boom of logs from one point to another, a distance of about 500 feet. The boom was being moved when it got beyond the tug and was swept down the rapids of the left arm of Kootenty Lake and lost. The two points in the appeal are: "Had the parties applying for the use of the boom sticks authority to enter into a towing contract," and "Were they negligent?" They claim that the boom was swept away by the act of God, a wind springing up and carrying it away.

Alexander E. Sutherland of Vancouver, with Balfour & Parker of Toronto as his solicitors, has begun an action against the Skeena Timber Company, Limited, A. W. Ballantyne and Charles F. Ritchie, of Toronto, that may result in a contest for the control of the company. Mr. Sutherland claims that he sold a timber license, valued at about $600,000 to this company, receiving half of the stock. The balance was to be paid in cash instalments, in default of which other stock was to be transferred to him. He says he has received $20,000, but he claims 4,546 shares of stock and $25,000 damages. There is said to be 10,000 shares of stock of which Sutherland is said to possess 5,000, besides his claim of 4,546.

The Supreme Court has quashed the appeal in the case of the Brompton Pulp and Paper Company vs. Bureau. The jurisdiction of the Supreme Court was questioned by the defendants in the original case who claimed that the matter did not fall within the subjects limited in respect of appeals from the province of Quebec. Mr. Stuart, K.C., contended that the construction and maintenance of a power dam and the right of servitude to use the dam were questioned, and, therefore, rights to real property were involved and the appeal would lie. The court decided that the only issue was one respecting the amount of damages resulting from the construction of the dam, and as they amounted to $200 only, there was no jurisdiction and the appeal was quashed.

Col. A. D. Davidson, land commissioner and president of the Canadian Western Lumber Company, is reported to be perfecting an active colonization movement among the French-Canadian lumbermen from the Ottawa and Gatineau valleys to the province of British Columbia under the auspices of the Canadian Northern Railway, of which company he is also the land commissioner. At the Canadian Western Lumber Company's mills on the Fraser River, there are already 200 habitant families employed and it is said that many of their friends and relatives are making preparations to leave in the spring for the far west, where steady work and a guarantee of good schools and churches has been made by the promoters of the invasion.

The Retail Dealer and His Problems

The Meaning of Profit—Selling Flooring

What is Profit?

What is profit? Some business men who manage to make enough money to live upon carefully don't give enough attention to this question and it happens now and then that this type of man comes to grief when a period of depression arrives. An article by A. H. Jackson in the Merchant Trade Journal recently dealt with the problem in a general manner. The object of the article was to show where the profits of the country merchant have gone.

The article is intended entirely for the general merchant, but many of the suggestions made are applicable to operating a retail yard. As Mr. Jackson points out, too many merchants are given to computing their prospective profits on average and do not accordingly keep close enough account of the profits to be made from the sale of various commodities which they handle. In the lumber business particularly, few realize how much it costs to carry on their business. A profit of four and five dollars a thousand seems to be very liberal, but if it costs twenty per cent. to do business this supposed profit is entirely wiped out by legitimate expense.

We would commend a careful perusal of this excellent article and believe that a good many dealers will find much food for thought in his suggestions. He writes as follows:

"This, brother merchant, is the perplexing question with many. Where do the profits go? Thousands of merchants over the country are now taking or preparing to take their annual inventory. While this is being done most of these merchants are quietly pondering what will my profits be for 1910?

"How is it with you? Of course, you know exactly what your expenses have been, also your sales, and taking these two items as a basis and calculating your average gross profit at 25 per cent. you say to yourself, my net profit should be about so much.

"You set this amount in your mind and proceed to invoice. No doubt you have had this very experience in seasons gone by and the inventory showed a net profit much smaller than you had expected. This, to say the least, is a disheartening thing, and it sets you to studying where the balance of the profits went. You know what your sales were and your expenses and you feel confident that your goods were marked at least at an average gross profit of 25 per cent. on the selling price, but your profits did not hold out with this basis.

"You study and wonder why and where it went to, and finally lay it to a little waste here and there, or to one thing or another, then, without fully solving the condition that produced the result, you enter another year's business, struggling under the same fallacious conditions.

"For your own sake, for the sake of your family and for modern merchandising don't do it any more, brother merchant. It is an easy matter to know previous to the inventory very close to what your profits will be. But, first, you must give up the method of determining results by figuring with average gross profits to such a great extent. The fallacy of averages is deceiving more merchants to-day than any other point in their figuring. So many estimate that their average gross profit is a certain per cent. when it is actually not near up to that per cent.

"Now, you wonder why this is the case, and I will answer with one word—averages. If a man invoices his stock at cost and retail value the difference would be the total marked profit in the stock. Now divide this amount by the total retail value of the stock and you might say that the result would be the average per cent. of gross profit, but it is not, by any means.

"This average is reduced from a number of sources. First, and most conspicuous of these is the loss of profit by goods sold at less than the marked price. Now, say you are running a store of ten different lines of goods, this seeming average will again be cut down by the lines showing the smallest profit, as these lines will turn their stock faster than those carrying the long profits. Also, the staples (which show the smallest profit) in each line will turn faster than the fancy goods which show the best per cent. The fallacy of averages is not fully comprehended, as a rule, at first thought. Study the last two paragraphs over and from a point of your own experience. Perhaps it may assist in determining why some profits you had expected never showed up.

"They did not because they were never made. Now suppose this same stock of ten lines of goods is invoiced in the same manner, keeping each line separate, and finding the average gross profit on each line, you are very much nearer your correct average, but you are still far from reliable or comprehensive figures, as your average is made covering a long period, perhaps twelve months, as well as the other varying conditions already mentioned, having some effect.

"Did it ever occur to you how many merchants go through the year without knowing approximately what they are making until the close of the year? They have about a fixed expense, but if sales run up or down, they do not know what the result will be.

"Why it this? It is all from doing business by averages and the absence of an accounting system that gives comprehensive figures showing the actual condition at the end of each week or month as desired.

"Why not eliminate the averaging of things from your business as far as possible by putting your store into departments? It will require a little more office work, but the value of the extra information and satisfaction of knowing where you are at is worth the effort many times over. The department plan is the only way you can avoid averages to the minimum and presents the modern phase of merchandising.

"With the department system your most valuable information no doubt is gained by the facts brought out by figuring the retail value of each invoice. By a record of the retail value of the invoices of each department you are able to tell the marked profit in each department at the end of each week or month, or at any interval that you care to make a footing.

"You can readily see how, with your accounting divided into departments you have segregated the figures for the lines of goods showing different profits. Now by figuring the retail value of each invoice you have both the cost and the selling value of the goods put into each of the different departments. By footing these figures for each department at least once a month and then finding the per cent. of gross profit from these footings it is obvious how very close it shows the true per cent. Instead of taking the stock as a whole and figuring over a period of a year you have taken the lines separately and the figures covering one month.

"You have reduced the fallacy of averages to the minimum. Also when you know the cost, retail, and sales of goods, it is an easy matter to know very close to the value of the goods on hand, as well as the profits at any time. Perhaps you imagine all this involves a lot of complicated records, but it does not, if properly laid out. Of course, they are not automatic, and you must be willing to make a little effort each day to keep them up."

Along the same line of thought George E. Green has contributed a few thoughts for the Scout, which should be very carefully considered by the retail trade.

"I often work out a blackboard exercise. One of the great reasons why business is not profitable is that the merchant doesn't know what his margin of profit ought to be, and it along this line that we want to get together and endeavor to put our business on a good basis. We must figure what it costs to do business, how to figure our percentage to cover the cost so as to leave us a margin as remuneration. I ask: What is your expected gross margin of profit? The answer comes, 20 per cent. Then, what is your cost for doing business? Here is where they fall down. Some say 15, 16, 17 or 18 per cent. Let us strike an average of 17 per cent. How do you figure your percentage of profit? Do you put it on the cost or the selling price? Probably a majority will answer, "Oh the cost price." Take, for illustration, an article that costs $1.00 and sells for $1.20. Add 20 per cent. to the cost. Say it costs 17 per cent. to do business. That 17 per cent. is figured on the $1.20 you have taken in, consequently, 17 per cent. on $1.20 is 20 4/10, therefore you lose 4/10 of 1 per cent. on every transaction. If you want to make 20 per cent. on your sale price, you must add twenty-five per cent. to your cost price in order to come out even.

"We have persistently fought the mail order houses and the parcels post proposition. In the mail order case, we must recognize that the competition is here to stay, and our advice to the local dealer is to use, wherever possible, every means of legitimate publicity in order to let the various communities know they are doing business. The development of the mail order houses has been possible through publicity and has grown because the publicity has been practically on one side. The dealers in the smaller communities have not valued publicity for what it is really worth.

"The parcels post we have fought not only on the ground that it is disastrous to the retail merchant, but because even from the point of doing the greatest good to the greatest numbers, the parcels post will not work out. Bear this in mind, that the only person who will receive a benefit through the parcels post is the person who buys something away from his legitimate trade center."

Because of the present multiplicity of yards, we believe that it is ill-advised for any one to attempt to establish any retail lumber yards at points where there are two or more yards in existence. Careful investigation will disclose the fact that for every single point where the establishment of an additional yard is warranted by conditions, there are at least a score of towns where one or more surplus yards are competing for the limited patronage.

In offering this gratuitous advice, we are actuated by conscientious and unselfish motives. The more retail lumber yards there are in existence, the more possible subscribers there are for our journal. The producer also is temporarily benefitted in proportion to the number of buyers seeking to buy the material he manufactures. Any temporary benefit, or small profit which can be made either by the manufacturer, the wholesaler, or the retail dealer, does not warrant jeopardizing the future welfare of the lumber industry. If the retail lumbermen are not prosperous, those who sell them the material they handle, cannot prosper. Abnormal and fictitious conditions cannot prevail indefinitely, and a day of settlement is sure to come.

As a rule, it is to the interests of both the consumer and the retail lumberman to have legitimate competition in every community where the trade is sufficient to support two yards. The consumer bitterly resents anything that savors of monopoly. It is well known that the average farmer will go a long distance for the purpose of trading at a town where two or more merchants are in business, if there is only one merchant in the village where he would naturally go. There are a few one yard towns where the establishment of another yard is justifiable. It is also possible that even where there are three or more yards now doing business, the rapid increase in population and the trade which gravitates to that center will warrant the advent of another competent retail lumberman. In these isolated cases, it is essential that the company or individual adopt a very conservative policy in competing with the old established concerns.

Those who have had little experience as merchants, frequently make a mistake in presuming that the only way they can attract trade is to materially reduce the prices which have prevailed for the staple necessities in that community. The policy results in retaliatory measures, and the new merchant, or retail lumberman, finds that the value of such staple necessities is soon reduced to cost. Every competent merchant or retail lumberman must depend for patronage on his abilities as salesman, or some special advantage in location, the quality, the quantity, or the character of the merchandise offered for no permanent advantage can be secured by selling any staple articles at less than a reasonable price. To offset the loss or lack of profit from such sales, the dealer must increase the price of other material he handles.

We condemn, in unmeasured terms, exorbitant charges for lumber or building material. We do not believe in agreements between dealers, nor a division of patronage or trade. The laborer is worthy of his hire, and the retail lumbermen are entitled to a fair compensation for their time, labor, and the money they invest. The consumer is not benefitted permanently by any disagreement between the retail lumbermen. Usually, such contests end in both parties advancing prices, in order to recover some of the losses inrurred in selling material at less than its reasonable value. A staple market, with reasonable prices, is beneficial both to the merchant and the public.

Floor Facts for the Retailer

Certain facts and features pertaining to the flooring trade are discussed here for the benefit of the hardwood flooring manufacturer so that he may make use of them while acting as a vehicle to carry them home to the retail dealers in lumber and building material in his territory. There is a certain group of floor facts that the hardwood flooring manufacturer already has in hand and is trained in dispensing. Facts relating to the quality of a hardwood floor as compared to other material offering for the same purpose and to the essential qualities in manufacturing; facts relating to methods of laying and finishing off floors, it is not necessary to elaborate on in detail in this article.

The first point of importance in mind is the fact that the average retailer carries in stock a much more diversified line of pine and other flooring than is necessary. It is this very fact which often stands in the way of his taking on a line of hardwood flooring. He feels that it is adding too much to his flooring variety, so he puts in only a little or perhaps no stock of hardwood, but depends on using a catalog and ordering hardwood flooring from some nearby manufacturer when a customer wants it.

One retailer, who is among the most prominent if not really the most prominent man in his state in the retail lumber business, said once when the subject was under discussion, that he did not carry any hardwood; his stock was too large and had too many 'different kinds in it as it was and that he felt it would be confusing to increase it by a multiplicity of sizes in hardwood. He depended mainly on special orders when customers wanted hardwood stock and confessed that he let quite a lot of the hardwood flooring reach its customers through other channels.

The point this retailer should have grasped, and many others need it brought home to them, is the fact that they can carry a fair line of hardwood flooring without increasing the quantity or variety of the flooring stock in general. Indeed, hardwood flooring when properly regarded simplifies the matter of flooring stock, and it is this fact the manufacturers should carry home to the retailers in their territory.

With hardwood for the really high-class floors, there is no need for the retailer to carry six or eight different widths of Pine flooring and three or four different grades. The thing for him to do is to size up the situation in his community and cut his pine flooring variety just about in half. Many dealers could get along very well by carrying simply No. 2, 6-inch common and No. 1 common 4-inch pine flooring and adding to this two thicknesses and about two grades of oak flooring.

This would give less in the way of confusing variety of flooring stock than is carried to-day in the average yard, and at the same time it would put the retailer in a position to supply either an ordinary pine floor, a thick plain oak floor, or a sub-floor and an elegant top floor.

To get a more elaborate illustration on this point let us suppose there is a furniture store in a country town where a retail lumber dealer is also located. If the furniture store were of ordinary dimensions, it could fill all its available space with chairs by taking on some of every variety offered, for there is such a multitude of patterns of chairs that they would stock a good sized store without getting more than a set or two of each pattern. It would not be wise for them to do this, of course, and the wise merchant will conclude that just a few varieties of chairs, carefully selected to meet the needs of his customers and go with his other furniture offerings, would be the right thing for his stock. He would not be likely to confine those few varieties to one kind of wood.

So it is with the dealer in the flooring business. Only the dealer has, figuratively speaking, been putting in too long a line of chairs of one kind of wood. He may have spread out and added this grade and that size of pine flooring to his stock until he already has so many that the prospective customer is confused as to which he ought to use. The right thing to do is to reduce the variety of pine carried and also limit the variety of oak and select with care, after studying the needs of the community. Then boost these and their qualities so industriously that the customer will have made up his mind before he comes to buy that the thing the dealer has in stock is just the thing he wants.

With just two or three different kinds of pine flooring as suggested above, two thicknesses in oak flooring, that is the full 13-16 thickness and the 3-8 and about two grades, one has a fair stock for serving the retail trade with flooring in the proper manner. In this connection it is well to argue against too great a variety of widths as well as thicknesses in hardwood flooring, otherwise it may lead to the same trouble which exists in connection with yellow pine, that of confusion in variety.

Urge each dealer to decide what width will go best in his community. If it is a 2-inch width, then stick to the 2-inch width, both in thick stock and in thin. If it is a 2¼-inch face, stick to that width. If it is 1½-inch net face width, then let him adhere closely to that, urge it and talk its good points and keep his customers' attention so closely directed to its good points that they will not be inclined to ask for something different.

It is both possible and practical to handle a thing of this kind in a rational manner; it is only a matter of getting at it right. And it looks like now that the first step toward developing a much heavier trade in hardwood flooring through the retail yard is that of bringing home to retailers the fact that they already are carrying too great a variety in flooring; that they can reduce the variety, add hardwood flooring and at the same time simplify their work, give better satisfaction to their trade and be in better shape to control the situation.

Would it not be a good idea in this connection to put some husky able-bodied orator into training soon and get him thoroughly equipped with facts and figures and arguments and have him appear before the retailers' meetings next winter and spring, to present in convincing form some facts which would be calculated to increase the volume of hardwood flooring going through retailers' hands?—Hardwood Record.

It has been demonstrated that "with 57 per cent. waste paper, 22 per cent. straw, 5 per cent. jute and 16 per cent. wood fiber, a ton of artificial lumber can be made which is superior to, and cheaper than, the real article." What's the use of worrying about the timber supply so long as Sunday editions continue to be published.

Running the Shaper

New methods of doing work are constantly being worked out by ingenious mill men. In probably every woodworking shop in the country some operating method, some "kink," is in use which is not given in any manual of practice; but which, nevertheless, effects some real saving of time and money. The author has made note of a number of these, coming within his experience. They ought to help others. An exchange of ideas is always good.

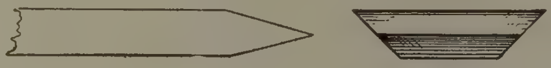

Fig. 1.

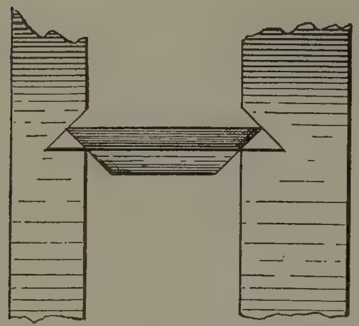

Fig. 2.

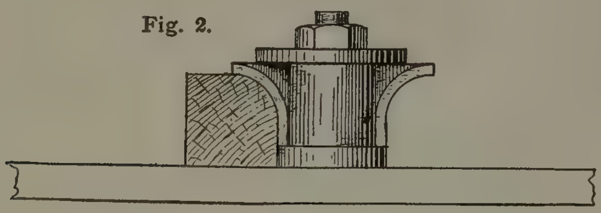

Fig. 3.

In working across grained stuff or stuff apt to splinter ahead of the knife, work backwards; which also helps, in the case of heavy material, to feed the stuff along. In making a cut on the shaper where you do not want to split off beyond the cut, use a cutting gauge, or sometimes wet the piece a little along where the cut is going to be made. In working circle work where you have to work right and left, instead of making two cutters, bevel the one both ways like Fig. 1, then put it in the head reversed as shown in Fig. 2.

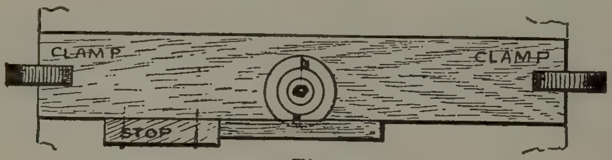

Fig. 4.

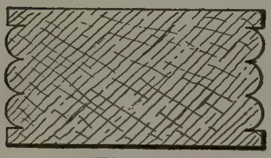

Fig. 5.

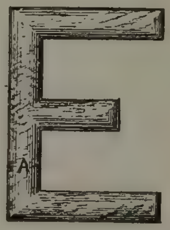

Fig. 8.

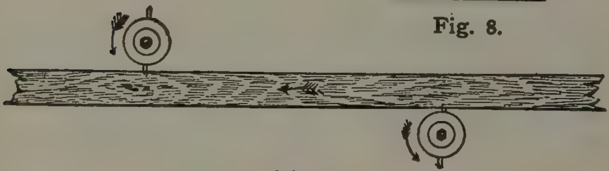

Fig. 6.

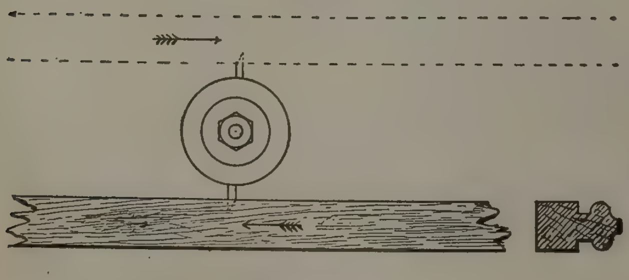

Fig. 7.

Many small shops that have no jointer can use the shaper for such by taking a worn out planer knife and cutting it off four or six, or whatever inches the spindle will take. Bevel the ends to fit collars and make a straight edge gauge to clamp on the table top; and a jointer is there—a high speed chap too.

Instead of turning store front corner posts two and three inches in diameter and eight, ten, and twelve feet long, square them up on the jointer and rip saw, and run them over the shaper four times. This makes the sticks nearly as round as turned ones and no bunches occur. Fig. 3 shows the scheme.

In making finger holes in soft drink bores, I use the shaper with much success, by putting a straight edge or guide board on with clamps, put in the shape cutter desired, projection, etc., nail a stop on the edge of board to place end of boxend against as shown in Fig. 4. Push into cutters gradually. The thing is easily done and nicely, too.

Here's one: I have seen both heads of a shaper working at the same time on a piece of stuff, each making a separate cut. It takes two machine hands to do this stunt, though, and make time. I have seen beaded moulding like Fig. 5 run this way between the heads as shown in Fig. 6. Of course it takes some good work on the part of the men, because you have a double shuffle movement.

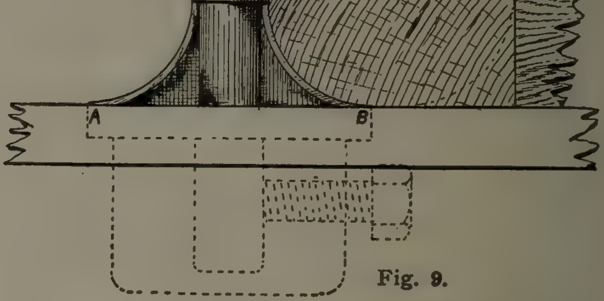

Fig. 9.

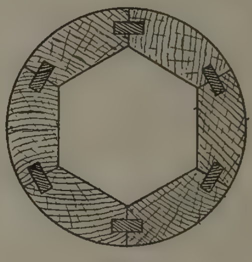

Fig. 10.

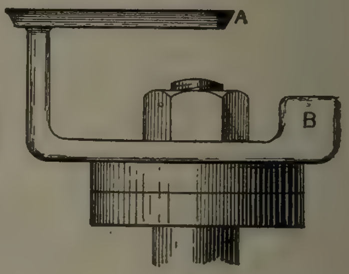

Fig. 12.

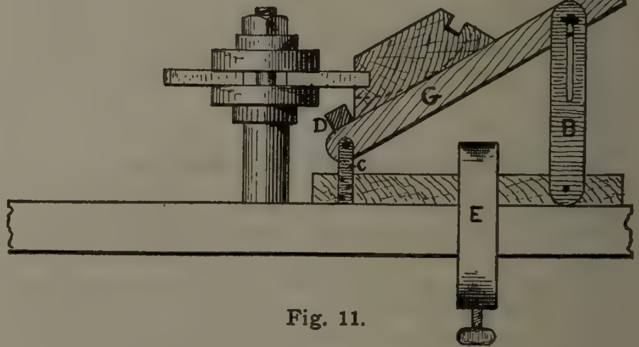

Fig. 11.

In running heavy or long stuff on the shaper, I always run in the regular direction, then instead of turning the piece end for end, put it over on the other side of the head and turn it the other way. The head always running the same way, of course. Fig. 7 shows the scheme.

A very good way to work a moulding machine and a variety moulder or shaper in conjunction with this is to use segment steel on the moulder with a cap; then the shaper man can use the same cutters in the shaper. This makes the straight and the circle moulding very nearly alike. It saves the shaper man making a new cutter or faking others; of course, the shaper should have a large pair of collars to receive the longer moulder cutters.

A very neat appliance in the shape of a cutter used to round wooden letters half round, like Fig. 8, is shown in Fig. 9. This cutter stem is put in the mandrel of the variety moulder so that the points A and B come up flush with the table top. The letters are piled upon the shaper face down (in order not to round the back while speeding) and held by both hands. Such a cutter, if properly ground and sharpened, will cut against the grain very nicely, the ferrule at the top is the only bearing, so you see you can run nearly up into the corner of a letter, leaving very little hand work. The cutters are numbered such as 14 and so on. Whatever the width the letter is at A, Fig. 8, is the width the cutter is from A to B in Fig. 9. This makes the section practically half round. It is a great help in this class of work.

In making staved columns I use the slip tongue joint, Fig. 10, and find it as good as any; all of them get their test from the outside elements.

My method of ploughing the staves is on the shaper, thus: I use a hinged board, clamped on the shaper table at both ends and adjustable so as to fit any angle, according to the number of staves. Two men or boys work this scheme; one pushes the staves through the trough, while the other fellow shoves them back for the other plough; a continuous performance. Fig. 11 shows all this. E is the clamp, B the adjustable angle holder or call it what you like, D is a small strip screwed on to the board G as a guide, C is the hinge, and G is the angle board.

I had a job of cutting 4½-inch holes through 5-inch oak blocks which were to be prepared for a building mover; to do this quickly I had a cutter forged out at the blacksmith shop, and put it on the top of the shaper spindle, as shown in Fig. 12, in which A is cutting edge, B is made heavy so as to get a balance. Of course I could not get this appliance down low enough to clear the table top, so had to screw a piece of 2-inch stuff on the shaper top, then lay the oak piece to be bored on top of that. Hold with an improvised lever and work hand wheel so that the cutter comes up gradually; soon the job is done; another on the table, and so on.

Carelessness and Ignorance in Planing Mills

By Milo Cawthorne

One would think that, at this age of progress, system, hurry, and with almost unlimited facilities for getting information on almost any subject, and an abnormal appetite for money, men in every capacity of life would be far in advance of what most of them really are.

Take the planing mill, for example. We won't get past learning at any age, but there are many things that are unknown to men whose duty it is to know, and for which there is absolutely no excuse for ignorance.

Taking charge of a shop with a capacity of 60,000 feet per day of ten hours, the first thing I saw was the flooring machine doing bad work. The stock came out wavy, first on one edge, then the other, and then on both edges, with an occasional space where the waves extended entirely across the board. The feeder was a man who had been with me long before. This was on Monday morning. I asked him why they were running stuff that way, and he said the foreman had never been able to prevent it; that the machine had "crazy" spells. Sometimes it would put out smooth work, then begin to run this kind for days at a time.

I asked him how often they changed knives on the bottom head, and he said about every ten days. I told him to draw the head and put on fresh knives. "Why, these knives are good and sharp, for I filed them just before quitting time Saturday!" I said: "Nath, do you mean to tell me that you use soft knives on the bottom head and run ten days without making a change?" "Yes." I picked up a piece of the flooring and put a straightedge across the back, which showed a strong 1/32-in. full in the centre. I showed him that not only would it be wavy, but uneven matching. His former work with me had been in the moulding room, and this was a new stunt to him. He said the old foreman had spent hours at a time trying to stop this, but could not; and when it runs nice and smooth he did not know why—hence those "crazy" spells.

In the first place, when a man gets to the point of foremanship there is no excuse for such ignorance as this. Second, the idea of keeping soft knives on for ten days without grinding would indicate laziness pure and simple. And, third, what in thunder did he have soft knives on for? There were plenty of hard ones, and good caps for them. Dull knives are invariably filed most in the middle, making them low, which, in turn, finishes the stock "high" or "full." When the under cut is first, it leaves an uneven surface to pass over the bed beneath the top cut; and the upper side of the board being uneven, it will vary under the pressure, first one edge, then the other rising from the bed. Not only will the edge that is up cut rough, but more thin than the one that is down hard. This condition causes an irregular travel between the tonguing and grooving heads, and the matching will vary, showing high and low places. In using hard knives on the bottom head for flooring, they need have but little, if any, back bevel, as they stay sharp longer, and are easily touched up with an emery stone.

Concerning the bevel that knives should have, only general rules for certain general classes of timber can be given. The best and only thorough way is for the foreman to make a number of practical tests, noting carefully the work after each change, and when the proper degree is found, stick to it. Really the best way is to make a metal template and hang it up by the grinder.

The kind of work also has much to do with the bevel that should be used. A lower degree may be used in running any single-faced stock, as the stock should be properly grained in feeding, but with double-faced stock, as partition, double-faced ceiling, etc., a shorter bevel must be used. In running stock for sash and doors, that is to be sanded, almost a radial-line bevel may be used, as it practically does away with torn grain; and the lack of that hard, smooth finish necessary on other work, is overcome by the sander.

There is another loose practice in a number of planing mills in the northwest—and probably throughout the country—that comes partly through negligence. It is the manner of feeding slash-grain stock. An association inspector told me he had found as much as eighty per cent. of slash-grain flooring run with the inside of the board to the face, lowering the quality a grade below what it would have been had the outside been run to the face. And when the foreman was taken to task, it was plain that he had no idea what the "inside" or "outside" of a board meant. I frequently meet regular planer feeders who know nothing of this. Here is more inexcusable ignorance. Slash-grain stock should never have the inside run for the face for any purpose, much less for flooring.

Though it seems a travesty to describe the inside or outside of a board, the inside is the face coming from next the heart, and the outside toward the sap, of a board that is cut from the log at right angles with the radial line, known as a "bastard" or "slash-grain." The inside grain will tear and rise much worse in machining than the outside, and if put in a floor with the inside laid up, it will soon begin to "tongue" and splinter; and it lowers the grade of material run this way. "Vertical" stock is just the reverse, having the inside and outside edge; and if the feeder will run the outside, or sap edge, against the rail as much as possible, it is not nearly so apt to "crawl" away from the rail.

While discussing the grain proposition, it may be of interest to those who contemplate or have already tackled the Pacific coast redwood proposition, to know that in running narrow stock, say 3-in. or 4-in., that is quite dry, more or less trouble may be caused by too much pressure on the feed rolls while running slash-grain. This wood is quite soft and the grain is easily broken loose by carelessly setting the feed rolls of a heavy machine down too tightly. Ofttimes feeders will let a thin board, or a board with a thin end, get past them, then set the rolls down to put it through—and then leave them down. It is poor practice in any case, but don't do it on narrow, dry, slash-grain redwood. If the stock is vertical, the trouble will arise from another source. If quite dry, it is easily compressed, and after lying for a time after machining, it will seek its normal condition to an extent, "swelling up," so to speak, and becoming worthless.

Speaking of hard knives, a correspondent of The Woodworker said, some time since, that hard knives put on a cylinder and run without using a jointer, will continually nick or chip, and gave as a reason that knives cannot be set so they will cut equally, unless jointed, and that the one doing the heavy cutting is the one that nicks.

I have seen both hard and soft knives put right on the machine from the grinder, without any other preparation. You can safely gamble that that fellow had nicks galore. The hard as well as the soft knife will have the "wire" edge when brought to a through-and-through grind, or to a new edge. Now, all this must be removed—and it cannot be done by "sawing" it across the corner of a board, either. We must resort to the whetstone. Of course, if the jointer is going to be used, whetting is not necessary, otherwise it should be used until you can draw the edge of the knife across the thumb nail without feeling it move; and when you do that you seldom develop a nick.

It makes no difference if I am using an old-style machine or not, I use the hard knife—moulding cutters and all—and they give me no trouble. I can also get better results by having a heavy carborundum stone handy and using it on the knives just before jointing; it keeps the back or bevel from getting so heavy.

Going back to the question as to how long a set of knives should run without grinding, I got a good story from an association inspector that I meet occasionally. While attending to his official duties in the stock shed, a car of flooring came out with the grain badly torn and raised. (By the way, this inspector is a planing mill man himself.) He went in, had the flooring machine stopped, and took a look at the knives. And of all the knives! To begin with, he said, the bevel had been worked down from a 15—25 to 10—20. He asked, "In the name of sixteen devils, how long has that set of knives been on without change?" The foreman said, "Thirty-two days. It is the only set I have."

It is just as true, or more true, perhaps, with a planer than almost any other tool, that sharp knives are true economy.—The Woodworker.

This 1911 Model of the

Linderman Automatic Dovetail Glue Jointer

Makes a Tapering Wedge Dovetail Glue Joint

A Glue Joint that proved by the technical test made at the Purdue University to be stronger than the flat or "V" joint or the natural wood. Its use then gives the positive assurance of the best results obtainable.

TO make a Glue Joint as strong as the natural wood it is necessary for the wood fibre by **close contact** and by **adhesive** to be knit together substantially as well as nature binds its wood cells. Warm lumber—warm glue—and a warm room gives the adhesive an opportunity to enter the pores of the wood—but absolutely perfect and effective pressure the entire length of the joint must be exerted to insure fibre contact—and the escaping of the glue to the surface of the lumber does not necessarily force the glue to enter the pores of the wood.

The basic reasons for the extra strength of the Linderman Wedge Dovetail Joint can be stated briefly as follows :—

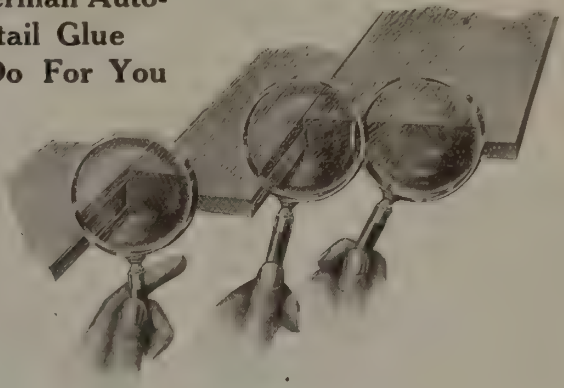
1st. Due to the shape of the joint—50 per cent. to 100 per cent. more glue and fibre surface.

2nd. The close fit of the sides of the dovetail form a pocket for the glue, preventing its escape, while the tongue and groove are gradually progressing to a fit—forcing, not merely permitting, the glue to enter the fibre.

3rd. The rub joint effect—as the tongue and groove wedge "home," that combs the fibre in the same direction, permitting a matted fibre union.

Canadian Linderman

What the Linderman Automatic Dovetail Glue Jointer Will Do For You



For the lumber manufacturers one of the most discouraging propositions is the disposing of narrow widths and short length stock so as to make a profit on it. Many manufacturers have found that by the use of the Linderman Automatic Dovetail Glue Jointer they are enabled to build up this narrow width into wide lumber and use it for their own products such as the manufacture of boxes, shelving, partition boards, and so forth, and quite a few of them who have no manufacturing plant sell them at a price varying from $2 to $8 per thousand more than what they had been heretofore able to obtain for the narrow widths.

For the box manufacturer there is no more profitable proposition than that of installing a Linderman machine and buying all narrow width, short length lumber and mill culls and converting them into one-piece ends, sides, tops and bottoms, at an average cost of from 50 to 75 cents per thousand board feet. This will enable the box manufacturer to buy his lumber from $2 to $5 a thousand cheaper and to put it into a package that is much superior to the ordinary box. In the 1911 Model of the Linderman Dovetailer, due to the tapering wedge attachment, it is possible for the box manufacturer to produce thinner stock which will make a lighter box, enabling him to compete with the substitute package.

We will be very glad indeed to send samples of the Linderman Joint and give further details to anyone who desires them.

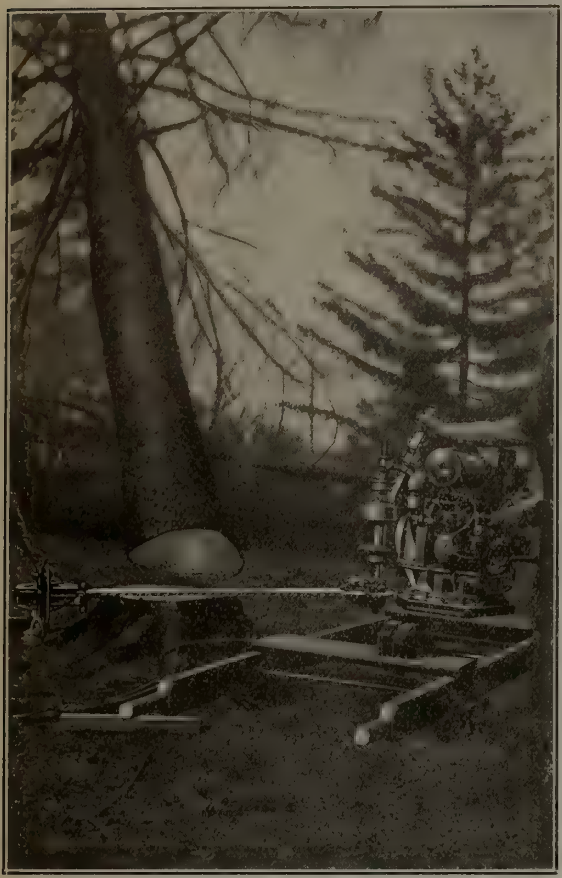
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The Endless Chain Saw



Tree Felling with Portable Saw

Before the invention and introduction of the endless chain saw the blade and teeth of saws were made in one integral part, so that the blade had to be reciprocated or revolved at the same speed as the teeth, with the disadvantage of requiring greater energy and less expedition in the work of felling trees or sawing up the logs and lumber. The construction of the International endless chain saw is apparent from an examination of the two illustrations herewith, one a tree-felling or stump-cutting machine and the other a log-cutting machine for reducing logs to lumber lengths, shingle blocks, etc.

With the endless chain saw the blade is stationary and the chain which forms the teeth moves,. Thus the minimum weight is moved and the motion is continuous and uniform, instead of back and forth, as in the old form of saw. The saw consists of a thin steel blade with a groove in its upper and lower edge, carrying a flanged sprocket wheel at each end, through which the endless chain runs. The chain consists of an endless band of steel links with teeth of standard form on one side, and the necessary projections or sprockets on the other side, which fit into grooves in the blade and receive power from the driving sprocket wheel at the pivotal end of the blade. The smaller saws are raised and lowered by means of an arched frame operated by rack and pinion and hand crank. The larger saws, from 4 up to 20 feet, are raised and lowered from the tower by means of wire cable attached to geared drums, hand-operated, the weight of the saw giving the required feed. Any form of power may be applied in the operation of these saws, but the most convenient for the portable machines is the gasoline or electric motor. The power required for the three-foot six-inch saw is seven horse power, and for the two-foot saw, four horse power. In the tree-felling and stump-cutting saw the blade is so arranged that it may be used at any angle and the saw may be lowered close to the ground and the felling may be done at either side. A 20-inch tree can be felled in 20 seconds and stumps cut at the rate of 120 in 10 hours. A six-foot six-inch cross-cut saw is now cutting cypress logs into shingle blocks near Abbeville, Ga., at a rate hitherto unattainable. These saws are also used on the edge of log pond, where the logs are floated to the saw and away at little expense, the saw cutting the logs in the water as readily as on the log deck. A 10-foot portable saw with gasoline engine has cut trees eight feet six inches in diameter at five minutes per cut with an interval of five minutes to move the saw for the next cut.

The portable felling saw outfit weighs complete about 500 pounds, and can be carried by three men. The trees when felled may be cross-cut into logs by turning the blade from horizontal to vertical position. In case of breakage of chain, it drops out entirely and only delays the work for a few minutes while replacing the damaged link. A spare chain is sent with each machine to allow for sharpening one while the other is in use. The power used for these machines may be detached and used for any other purpose desired. The saw may be used to cut cane, ice, etc.

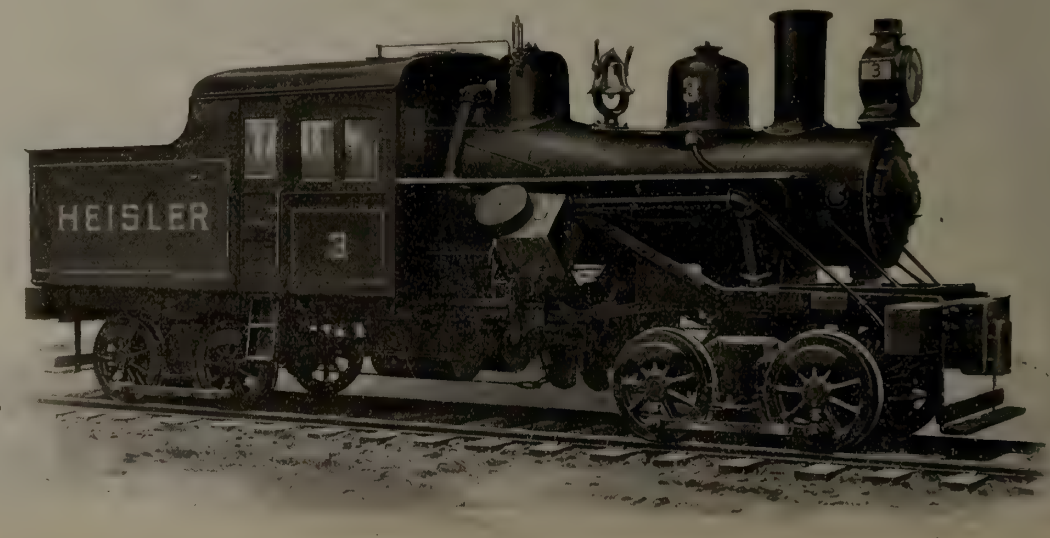
The endless chain saw is manufactured by the International Endless Chain Saw Company, 34 University Place, New York, and catalogues fully describing the saw and machinery may be obtained by addressing the company.

Geared Locomotives

The intending purchaser of a locomotive will find that there are three distinct types, and will do well to carefully consider which one of these is best adapted to the requirements in his individual case. The direct-connected steam locomotive, which is the type commonly used on all railroads, transmits its power by means of steam cylinders having their reciprocating parts direct-connected to the driving wheels. On account of its long and rigid wheel base this type of engine is not at all suitable for sharp curves, rough track, uneven roadbed, or steep grades. Owing to the small number of driving wheels in such locomotives the weight is distributed over a very few points and over a very short distance on the track. This necessitates heavy bridges, much heavier rails, extra ties and a thorough ballasting of the roadbed. The geared steam locomotive, on the other hand, is expressly designed to meet these conditions and will ordinarily be found to be much better adapted for use on private tracks, such as plantation, mining, logging and industrial railways, where the grades are often heavy, the curves sharp, the roadbed uneven and the track itself light.

The electric motor-driven locomotive, which is the third type available, will give the same tractive force or draw bar pull as the geared steam locomotive, but the cost of installing poles, wires, etc., and operating a central power station is usually prohibitive in cases where one or two locomotives are required. In most cases, therefore, where private industrial corporations require considerable haulage of material or product beyond the economical capacity of teams or traction engines the geared type of locomotive will be found to be the most economical. Not only is its first cost very much less for a given amount of tractive power than that of the direct-connected locomotive, but the cost of rails is often reduced one-half, while the number of ties is less, and important savings can be effected in the construction of bridges and in the ballasting and grading of the roadbed. It will also be found that for work on steep grades and sharp curves the geared locomotive is much more economical to operate and will give more satisfactory service, frequently hauling twice as many tons up a long grade as a direct-connected locomotive of the same total weight with the same amount of fuel.

These preliminary considerations have led a great many owners of private railways to select the geared type in preference to the other two above mentioned, and for this reason the Heisler Locomotive Works have made a specialty of designing and constructing geared locomotives. The illustration shown on this page represents a typical Heisler geared locomotive of diamond frame construction and straight stack. Locomotives of this type are made in all sizes, 42 tons and larger. The firm also manufactures locomotives of truss



Typical Heisler Geared Locomotive

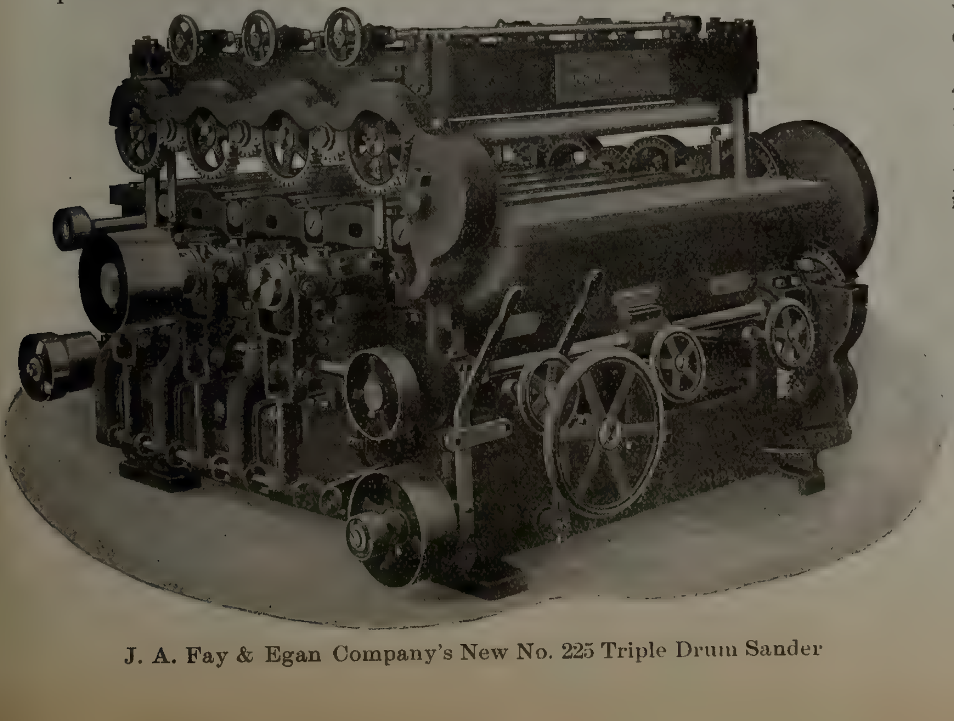
I-beam frame construction and with diamond stack in place of straight stack when preferred.

The general arrangement of the Heisler geared locomotive consists of a boiler mounted upon a steel main frame supported at each end by two swivelling trucks; a centrally located longitudinal driving shaft transmits power to the truck from the motor engine, having a single throw crank shaft which is located under the cylindrical shell of the boiler but free therefrom and bolted to the main frame. The driving axle in each truck is fitted with an enclosed and oil-submerged steel gear which is driven by the central shaft. The construction is such that all wheels are drivers, and the entire weight of the locomotive is available for traction power. The principles of this driving device have been adopted in modern automobile construction as the simplest and most efficient mechanism yet devised. Naturally, in an engine designed for heavy hauling, the gears in the Heisler locomotives are very massive, and in the 15 years since these locomotives were first placed on the market not a single gear has been reported broken. With a view to reducing the gears to the smallest possible number, for the sake of simplicity, efficiency and low cost of maintenance, the Heisler locomotive has but two pairs, each so arranged as to give a self-contained rigid support, proper protection from grit and perfect lubrication.

In the side view illustration of a Heisler locomotive shown herewith attention is directed to the construction and location of the motor engine on the main frame. It will be noted that this is entirely free from the boiler, while the well-balanced loading and central shaft drive permit easy change from wide to any narrow grade track or vice versa. In the catalogue published by the manufacturers of these locomotives every part of the mechanism is described and illustrated in detail so that an intending purchaser can understand exactly the purpose and function of each. The catalogue also contains numerous illustrations showing Heisler geared locomotives in actual use, and numerous valuable tables and other information of service to those who contemplate the construction of an industrial railway. For foreign shipment these locomotives, after being tested by their own steam, are taken apart and the various pieces marked to show their proper position, and to facilitate setting them up again all bright work is carefully protected and the various parts packed in strong tight boxes to prevent damage. Parts not requiring complete boxing are carefully wrapped and all boxes and packages are distinctly and prominently marked with the proper shipping marks and numbers, dimensions and weights. The manufacturers guarantee every locomotive to be in accordance with specifications, to be of the best workmanship and material, and accurately constructed to their duplicate system, and agree to replace within one year any parts that may show defects. For copies of this catalogue and additional information, address the Heisler Locomotive Works, Erie, Pa., U.S.A.

A New Triple Drum Sander

The accompanying illustration shows the J. A. Fay and Egan Company's new No. 225 Triple Drum Sander, a machine which renders hand labor and rubbing unnecessary and saves many hours' time and labor in changing paper, making adjustments, etc. The company claim that it is the only sander in three pieces, so that in case of accident to the drums, or when recovering, less than two minutes are needed to elevate the entire upper works high enough to remove the drums if necessary. There is no ncessity for removing the bed plates or disturbing the regular setting of the feed or pressure rolls.



J. A. Fay & Egan Company's New No. 225 Triple Drum Sander

The drums are made of hydraulic steel pipe. The shell is in one piece turned inside and outside and is therefore perfectly balanced and non-breakable. The drums are not forced into position therefore, and there is no consequent springing of the shaft.

The paper is held absolutely tight on the drums by their automatic take-up device so that the drum is not put out of balance when it begins to take up the stretch in the paper. It is suspended entirely on the shaft and does not depend upon spring pressures exerted against the shell of the drum.

The patented covering furnished with the drums is non-stretchable, firm enough to insure perfectly sharp edges and yet allow of a velvet finish. In working quartered oak and other woods of this description having hard and soft spots, the finish will be perfectly even. On account of the quality of the manufacturer's covering (the surface being absolutely true) the sanding paper is used evenly all over.

All the mechanism of the machine is exposed and easily accessible, saving an operator many hours a week by being able to watch and prevent cutting in the screws and nuts, thus preventing wear and insuring even pressure and good work all the time. New sandpaper can be placed on all three drums in from five to seven minutes.

With the manufacturer's oscillating mechanism it is practically impossible to produce waves and planer marks. All working adjustments are immediately in front of the operator and he does not have to leave his position to make such changes as are necessary. The four corner screws are mounted on ball bearings insuring easy movement for upper works and long life and quick adjustments.

The feed and pressure rolls are all made of seamless steel tubing being non-breakable and take a smoother finish than cast iron thus turning out better finished material. All bearings have reservoir self-oiling features.

Further particulars may be secured from the manufacturers, J. A. Fay & Egan Co., 465-485 W. Front street, Cincinnati, Ohio, who will send their Sander Catalogue on request.

An Efficient Surfacer

Among the many wood-working machines manufactured by Canada Machinery Corporation, Limited, at their three branches, located at Galt, Preston and Hespeler, Ont., their No. 218 surfacer stands pre-eminent as a heavy cabinet planer.

This machine has been designed particularly to meet the requirements of furniture, piano and high class cabinet work, and has incorporated in its design all the latest and best ideas for machines of this class. All vibration has been eliminated in the operating of this machine and the highest class of cabinet surfacing is turned out at a rapid rate.

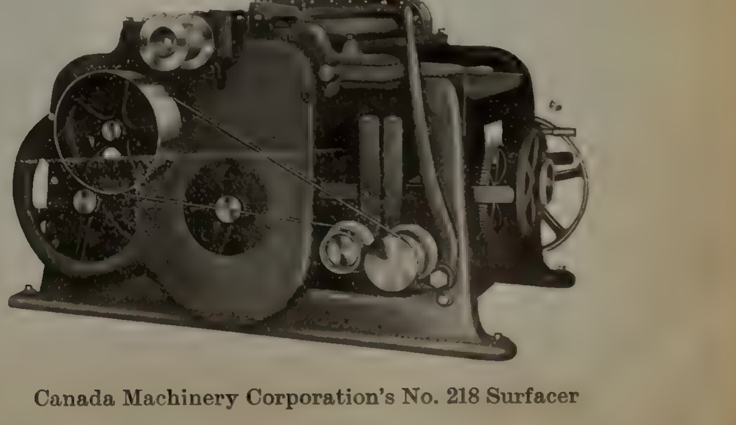
The chip breaker and pressure bar are of the latest type, working on a circle and admitting of the finest and easiest adjustment. The feed consists of four rolls, 5 in. in diameter, driven with gears cut from the solid.

The cylinder is made from high carbon steel, and runs in what is generally known as Whitney bearings, 2 5/16 in. diameter by 10 in. long. These bearings can be adjusted in a few seconds, so that the wear will be taken up evenly throughout their entire length.

The table, as will be seen, is exceptionally long, being 56 inches in length, and is made up of three pieces, raised and lowered on long wedges on each side. It is adjustable by means of a hand wheel clearly shown in the cut, geared in such a manner that a boy can raise or lower it. It is locked in position by a small hand wheel. The weights are on the inside of the machine and situated so as to be easily removed, and entirely out of the operator's way when working.

This machine is built in three working widths, 30 in., 36 in., and 48 in., and will take any material from ⅛ to 7 in. thickness, and deliver it clear of the machine.

Catalogues and information regarding their complete line of wood tools may be had on application to the head office of Canada Machinery Corporation, Limited, Galt, Ont.



Canada Machinery Corporation's No. 218 Surfacer

A Practical Device to Prevent Horses from Slipping

The capability and endurance of a horse can receive no more severe test than in the lumber camp. Rough, hilly roads, often mere paths, abound, and when in winter sleet and ice are added to make the conditions worse it is enough to try the courage of the strongest horse.

How to give the horse sure footing under such conditions is a problem, but the solution is simple. Red Tip Horseshoe Calks were made to fill just such requirements, and that they do their work is borne out by the statements of thousands of horse owners in North America.

Simple of construction, easy of manipulation and inexpensive, they fill a long felt want. Anyone, no matter how little experienced, can adjust a set in twenty minutes as shown in the accompanying illustration, and long waits for sharpening, losing time of both men and horses, becomes unnecessary.

Those who have not used this handy device would do well to send to the Neverslip Manufacturing Company, 25 St. Peter Street, Montreal, for their Booklet "A" which gives full information.

Users of calks should look for the Red Tip, the mark of the genuine Neverslip Calk, which will protect them from worthless imitations.

New Jeffrey Power and Transmission Catalogue

The Jeffrey Manufacturing Company, Columbus, O., U.S.A., have issued an excellent new catalogue on power and transmission, which is unusually complete and up-to-date. The catalogue lists a wide range of subjects and contains a vast amount of technical and valuable information. The matter is presented in condensed form and the complete line is listed, giving the entire information in a way that will make the book exceedingly valuable to the engineer in charge of an industrial plant, a mine, mill, or large factory where this class of machinery is used.

Besides listing dimensions and sizes of every part in this line, descriptive matter is included on the horse powers of steel shafting, standard methods of key seating, sizes and dimensions of couplings, hangers, pillow, blocks, counter shafts, belt tighteners, clutches, and quills.

A feature is made of the Jeffrey Improved Split Iron Pulley which may be readily clamped on the shaft without disturbing any other equipment, or many easily be removed from the shaft when necessary. A complete line of wood split pulleys and a very complete description and information on rope driving are also included. One of the features of the catalogue is the complete listing of the Jeffrey gears including spur, bevel, miter, angle reduction and angle miter.

There are many valuable details also in the rear part of the book including h.p. of belts, and the methods of calculating bending and torsional moments for shafts, which are invaluable to the engineering fraternity.

The Canadian office of the Jeffrey Manufacturing Company is at the corner of Cote and Lagauchetiere streets, Montreal.

The Latest in Transmission Machinery

"The Positive Line" is the title of a neat catalogue recently issued by the Positive Clutch and Pulley Works, 30-32 Lansing street, Buffalo, N. Y., which will appeal to all who are interested in the transmission of power. The catalogue is made up throughout of new material and describes, in a most interesting and practical manner, the excellent clutches and pulleys manufactured by the company. It also covers a complete line of hangers and pillow blocks. In addition to this the catalogue contains a number of useful engineering tables and formulas. It also describes the most recent developments in the transmission field and will therefore be of especial interest to progressive manufacturers. The Positive Clutch and Pulley Works have two well equipped factories, one at Buffalo, and the Toronto works, which are located at Aurora, Ont.

One of the most attractive stove catalogues produced comes from the well-known firm of Findlay Bros., of Carlton Place, Ont. The catalogue is splendidly prepared and will be greatly appreciated by the trade. An important section of the catalogue is devoted to the firm's camp ranges and heaters, which are becoming more and more popular with the lumber trade. Among the newest features of their ranges are the malleable lift rings to accommodate poles for portaging the range. This is a long felt want and will be greatly appreciated by the lumber trade.

The Thomas Pink Company, Limited, of Pembroke, Ont., whose factory was burned out several weeks ago, have started manufacturing again and are now in a position to fill all their orders.

U.S. Lumber Production in September

Shipments Slightly Greater than the Cut—Heavy Decline in Prices in the South—West Coast Conditions Unsatisfactory

The manager of the National Lumber Manufacturers' Association has presented the following report for the month of September:—

The report of the National Lumber Manufacturers' Association of production and movement of lumber for September, 1911, represents 582 mills, of which twenty-five showed no cut or shipments. The total cut of these mills for September was 781,500,000 feet; shipments were 786,200,000 feet, with a slight decrease of stock on hand.

On the face of it these total figures are encouraging, but when we consider that since the close of September prices have broken heavily in the South, and that there is no improvement on the West Coast, though some improvement in the market in some eastern and northern sections, it is evident that the adjustment of supply and demand has not yet gone far enough—that stocks are either too large or the spirit of demoralization still makes too free offerings, with a consequent demoralization of prices.

The report covers twenty-three states, practically all the recognized lumber producing states, except Pennsylvania, New York and New England.

Certain groups of states show well defined conditions. For example, Arkansas and Louisiana produced much less lumber than they shipped. This is due to a curtailment of cut, partly voluntary, but chiefly forced by labor conditions. If every southern state had followed this lead the yellow pine industry would not be in the condition it is to-day. But no sooner had a better statistical position been brought about by curtailment, chiefly west of the Mississippi river, than the east of the river mills took advantage of the situation, most of them maintaining full cut or increasing their output, leading to the decline and demoralized market experienced within the last month. Alabama produced ten per cent. more lumber than it shipped, showing how the market was crowded there, though Mississippi produced about seven per cent. less than it shipped. Generally east of the river the product was greater than justified by conditions, even though cut and shipments nearly balanced.

Rather an alarming condition obtains in the West. Every western lumber producing state cut too much lumber. California's excess of cut over shipments was 42 per cent; Idaho 48¾ per cent.; Oregon 12 per cent., and Washington 7¾ per cent. These figures should be modified to some extent by manufacturing conditions. In Washington and Oregon, for the most part, mills run summer and winter, as they do in the South, hampered somewhat by snows in the mountains. In California and Idaho, however, a large proportion of the larger mills are obliged to shut down during the winter. Consequently some piling up of stock during the summer and fall is allowable. The condition in those states is similar to what it is in Wisconsin, Michigan and Minnesota.

In Wisconsin, however, the cut was only 15 per cent. greater than the shipments and in Minnesota 33 1/3 per cent. greater. In the latter case the cut was evidently too large, compared with the current demand.

Notwithstanding the diverse character and values of the woods produced in different sections, they have a competitive effect on each other. The over-production on the West Coast, which unfavorably effects values there, also affects them in the territory east of the mountains. The over-production east of the Mississippi river in the South has led to an unhealthy competition west of the river. A sensible control of business by individuals, that control to be applied to their own affairs, would, of course, remedy the evils of the present situation.

The stocks shown at the end of September were only about five times the cut of the month. That should not be excessive, but under present conditions it is, and until the aggregate stocks are heavily reduced by rigorously restricting output, not much improvement is to be anticipated, unless, indeed, demand can be stimulated, as it will be by the proposed national advertising campaign, or until individual operators throughout the country wake up to the fact that they are practicing a useless and ruinous competition as between themselves, which could be avoided by individual conservatism and restraint.

The first official information of timber in the northern interior of British Columbia has been obtained by R. Trendor, assistant provincial timber inspector, who has returned from an overland trip, from Ashcroft to Prince Rupert. This information will be of value not only to lumbermen but to prospective settlers, since he took note not only of the timber but also the general features of the country.

Improvements in Wood-cutting Tools

By D. B. M.

In our anxiety to adopt new fads in machinery construction we are too ready to discard old ideas, good and bad alike. Many of the original notions about wood-working machinery have scarcely been improved upon, while other old features, cast aside for a time, have been restored to favor.

Twenty years ago about the only continuous-feed wood-working tool in use was the endless-bed planer. A few years later it lost friends and gained enemies until it began to adorn the second-hand machinery lists, and finally landed in the scrapheap, to make room for the planer with multiple feed rolls of large diameter and other supposed advantages. Lately, however, machinery builders are waking up to realize that the endless-bed has many advantages over the roll-driven idea.

The chain-feed tenoner, the continuous-feed jointer, face planer, panel raiser, cut-off saw, sander and sticker, are examples of some of the latest tools equipped with the endless-bed features, and who knows how soon we may go back to the endless-bed planer? For simplicity in operation, good work and vastly increased output, the machines referred to have demonstrated that this form of feed is one of the really meritorious recent improvements in connection with wood-working tools, and that it should be applied to all machines wherever possible.

Spoiled stock and defective machine work are due in a great measure to improper, jerky feeding devices. No matter how well a machine may be constructed otherwise, unless the feeding mechanism is positive and continuous, all other features count for little. If, in addition to improved methods of feeding, some change in the construction of heads and cutters could be devised that would prevent destruction of stock by chipping and tearing out, the operation of wood-working machinery would become a pleasant task instead of a continual source of trouble.

In the old white pine days almost any kind of cutter could be used, but western woods, such as spruce, fir, hemlock, etc., being of a different texture, are far more difficult to manufacture and require more refined treatment. Round heads, thin steel knives, jointing devices, back grinding, and many other ingenious and complicated expedients, have been resorted to with more or less success, especially on flat surfaces. When it comes to small mouldings, however, it would be difficult to imagine anything better adapted to chip and tear out than the ordinary head with the projecting piece of steel. Although these heads are usually surrounded by numerous cumbersome, awkward attachments, chipbreakers, etc., evidently intended to counteract the damage done by the cutters, their chief function seems to be to prevent the stock from going up the blow-pipe bodily.

Can anybody think of a better way to perform this apparently simple operation? On flat surfaces the cutterheads might be set at an angle across the board, so that the revolving cutters would not come in contact with the stock squarely against the grain, something similar to the old diagonal planer. Although molded surfaces would present many difficulties, yet in this age of advancement it does not seem unreasonable to expect some radical changes in wood-cutting tools. We who work in wood, having neither the time to study, the brains to design nor the money to build machines, can do little except tell our wants, agitate improvements and encourage the men engaged in solving our problems, by an occasional word of appreciation of what has been accomplished through the medium of the trade press.—The Wood-Worker.

Northern Hemlock Cut Increased

The Northern Hemlock and Hardwood Manufacturers' Association have issued the following statement of the cut and shipments of fifty-three firms during the month of October, 1911, as compared with the month of October, 1910.

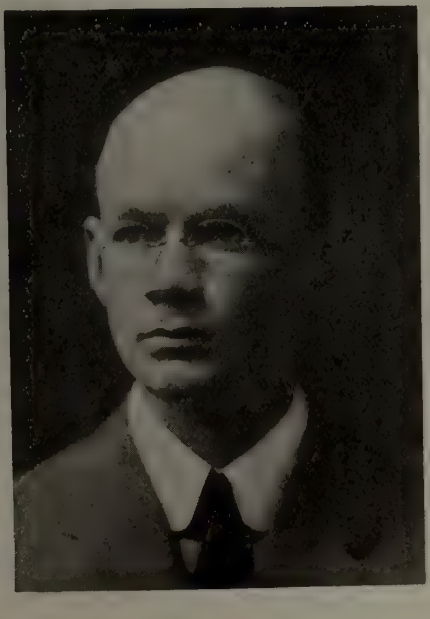
The following statement of the cut and shipments by the same 53 firms in October, 1911, compared with October, 1910, is compiled from the Association records.

	Cut, 1911	M Feet 1910	Shipped, 1911	M Feet 1910
Hemlock	35,629	19,583	33,341	31,897
Ash	395	403	902	352
Basswood	1,633	2,498	4,325	4,181
Birch	3,452	2,941	5,885	4,986
Elm	702	1,483	1,210	1,928
Maple	2,683	2,557	3,202	2,843
Oak	33	101	196	661
Mixed	884	575	2,511	1,477
All Hardwoods	9,782	10,558	18,231	16,428
Total	45,411	30,141	51,572	48,325

Increase in Hemlock Cut, 82 per cent.
Increase in Hemlock Shipments, 5 per cent.
Decrease in Hardwood Cut, 7 per cent.
Increase in Hardwood Shipments, 11 per cent.
Increase in Total Cut, 51 per cent.
Increase in Total Shipments, 7 per cent.

The exceptionally large hemlock cut in October was due to the heavy hardwood cut in the spring and summer which threw the hemlock sawing late into the fall. There is no reason to think that the total hemlock production this year has been greater than it was last year, and a large proportion of the stock now on hand is green.

An attractive certificate of membership in the Canadian Lumbermen's Association has been adopted by the association and is being mailed to members. The certificate is neatly designed and printed on a fine quality of parchment paper.



C. A. Lyford, Montreal

Judson F. Clark, Montreal

P. L. Lyford, Montreal

Lyford, Clark & Lyford, forest engineers, is the new name under which the well-known Montreal firm of C. A. Lyford & Company is now doing business. The members of this firm are: Judson F. Clark, C. A. Lyford, and P. L. Lyford. Mr. Clark and C. A. Lyford are also members of the firm of Clark & Lyford, forest engineers, of Vancouver. These two firms are at present conducting forest surveys aggregating over 500,000 acres. They report a rapidly increasing demand for their services.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

Spruce Wanted

We can use short spruce 4-4 and 5-4. Describe what you have to offer and lowest price delivered here. The Rathbun Company, Deseronto, Ont. 21-24

Wanted

250 to 350 M. feet B.M. of spruce timber required, in the round, to be cut the coming winter, and delivered next spring. For particulars apply to J. Sheppard & Son, Box 309, Sorel, Que. 20-23

Wanted

Cash paid for green clear maple axles, 4¼ in. x 5½ in., 6, 12 or 18 ft. long. If you can get out a car load or more, write us. Warren Ross Lumber Company, Jamestown, N. Y. 42-42

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Wanted

500,000 feet 4 in., 4½ in. and 5 in. Birch Firsts and Seconds for shipment as soon as sawn, green or dry. Quote best price on cars, giving amounts you can furnish. Box 353, Canada Lumberman, Toronto, Ont. 22-5

White Pine

WANTED—White Pine trimmer ends in any quantity and any thickness. Write, stating what quantity you have, what you want for them per cord f.o.b. cars your station, and any other particulars such as how piled, if bright, etc. Address, The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 20-23

Lumber Wanted

1 in., 1½ in. and 2 in. Black Ash; 1 in. to 4 in. Hard Maple; 1 in. and 1½ in. Soft Maple.
1 in. to 2 in. Basswood; 1 in. to 3 in. Soft Elm, and 1 in. to 4 in. Birch.

Send particulars to James Lauder, 501 Kent Building, Toronto.

Wauted—Box Lumber

Large consumer of No. 1 and No. 2 White Pine Box Lumber, desires to negotiate with responsible shippers, regarding stock for water delivery next season. Give shipping point, state quantity 4-4 and 5-4 can furnish with lowest quotations and other particulars.

Address, Box 374, Canada Lumberman, Toronto, Ont. 23-2

Wanted

Ten cars 1 in. and 1½ in. Dry Soft Elm, log run. Apply Box 370, Canada Lumberman, Toronto, Ont. 23-2

Wanted

two carloads 4-inch firsts and seconds, Hard Maple, dry, 6 inches and up wide, 10 ft. and up long, for immediate shipment. Quote price and point of shipment to Box 360, Canada Lumberman, Toronto. Ont. 22-tf

White Pine Logs Wanted

Wanted, sound, green, white pine logs (small second growth preferred) for immediate or winter delivery. State what quantity, where they are, and price by piece or by the thousand. Write The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 22-1

Birch Wanted

We want to buy Birch in all thicknesses. Log run or on grades. Will contract for winter's cut. National Lumber Company, Buffalo, N. Y. 23-2

FOR SALE—LUMBER, ETC.

Cedar For Sale

Square Cedar for sale; 1,000,000 to 2,000,000 feet, for next winter and spring delivery. Auger & Son, Quebec, Que. 22-1

Beech for Sale

For sale, two carloads Beech lumber, bone-dry, one and one-half inches, running high percentage clear stuff. B. Bell & Son Company, St. George, Ont. 21-24

Hemlock and Beech for Sale

About 100 M. 6-4 Beech lumber, dry; also about 100 M. 2 x 4 Hemlock, running 8, 9, 10 and 12. Thomson & Finley, Terra Nova, Ont. 23-23

For Sale

Pine—30 million feet estimated, close to Georgian Bay. Can be operated and driven at low cost. For particulars apply The Ontario Lumber Company, Limited, 20 Dowling avenue, Toronto, Ont. 23-24

Hardwood For Sale

We are prepared to cut under contract:—
250 M. to 500 M. feet Hard Maple.
100 M. to 200 M. feet Basswood.
Also some Black Ash, Birch, Soft Elm. Correspondence invited. The Pearce Company, Limited, Marmora, Ont. 22—tf

FOR SALE—MACHINERY, ETC.

Saw Mill For Sale

at Uhthoff Station, G. T. R. Capacity 25 M. feet, containing stationary boiler, 80 h p.; one engine, 50 h. p., and machinery outfit. Will accept $800 in full to close estate, as timber is done. Apply to W. B. Tisdale, Orillia, Ont. 17-t.f.-24

For Sale

One fifty horse power tubular boiler complete with front, grate bars, injector and smoke stack, and one thirty-five horse power engine, together with steam pipes and heater, for $250, f.o.b. cars. For particulars apply to C. H. Sheppard, Waubaushene, Ont. 23-2

Boilers For Sale

For sale, six 54 in. Tubular Boilers, 14 feet long, in good condition. Tested to 100 lbs. steam pressure, complete with all regular fittings and sawdust grates. Can be seen at Calumet, Que., or apply Riordon Paper Company, Limited, Montreal. 21-24

Extraordinary Proposition Log Cars

Russell 50,000 lb. capacity standard guage, automatic couplers, airbrakes, 26 in. wheels, strictly first class condition in every respect. Phenomenal bargain, immediate shipment. Write or wire.

DULUTH IRON & METAL CO.,
20-23 Duluth, Minn.

Equipment You Can Swear By, Not At

16 miles 56 lb. relay rail with angles, gross ton $25.00.
25 standard gauge 60 M. capacity log cars, guaranteed, $175. (Located near Toronto, duty paid).
42 Ton Shay, 10 x 12 cylinders, standard gauge, Port Arthur, $3,500.
31 Ton Shay, 10 x 10 cylinders, standard gauge, guaranteed, $2,300.

JONES PURCHASING AGENCY,
507-508 Andrus Building,
22-1 Minneapolis, Minn.

The Munn Lumber Co.

Whitney, Ontario

Whitney Saw Mill, fully equipped, three single cutting band saws and band re-saw with first class machinery throughout; nine steam boilers, 30 x 30, Corliss engine, machine shop, lighting plant, sprinkler system, refuse burner, blacksmith shop, etc.

1 Alligator Boat.
6 Pointers and Driving Boats.
1 Gasoline Launch.
Driving Outfit, including Warping Lines, Boom Chains, Pike Poles, Peavies, etc.
6 Camp Outfits, including Heaters, Cooking Ranges, Dishes, Cant Hooks, etc.
60 sets Heavy Log Sleighs.
6 sets Tank Sleighs.
1 only 50-ton Locomotive.
12 only 30-ton capacity Flat Cars, 37 ft. long.

1,500 tons 56 and 60 lb. Steel Rails.
100 tons 16 and 20 lb. Steel Rails.

We offer any portion or the whole outfit at a bargain. If interested write us for particulars and prices. 22-tf

Whitney, Ont., Nov. 8th, 1911.

Machinery For Sale

Carver, 4 spindle, Rohlman.
Cut-off saw, railway, wood frame.
Dovetailer, Boults.
Engines and boilers, various sizes.

Jointer, chair seat, Jenkins.
Jointer, 16-in. White.
Moulder, 6-in. Houston.
Mortiser, Smith.
Mortiser, Bit.
Planers, 24-in. single belted.
Sander, double 24-in. Perry.
Sander, three drum 42-in. Boardman.
Sander, three drum 42-in. Columbia.
Saw Gummer, Rogers.
Saw-mill, band, 63-in. wheel.
Saw and dado machine, Williamsport.
Variety Lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

For Sale

One 7 in. Planer and Matcher in good condition. Address, Box 359, Canada Lumberman, Toronto Ontario. 22-21

Machinery For Sale

We have the folllowing machines for sale at very attractive prices. They are all new machines of our own manufacture and are all ready to run:—

1 Combined Lath Mill and Bolter.
1 No. 1 Lath Mill.
3 Grand Triumph Shingle Machines.
1 Grand Mogul Shingle Machine, double blocker.
1 2-in. Steam Setter.
1 37-in. Vertical Water Wheel.
1 No. 71 Circular Saw Sharpener.
1 No. 40 Circular Saw Sharpener.
3 No. 35 Circular Saw Sharpeners.
3 No. 100 Band Saw Sharpeners.
2 No. 62 Band Saw Clamps.
1 Band Saw Shear.
1 14-in. Brazing Table.
1 No. 2 Circular Gang.
1 No. 0 Circular Gang.
2 Hanchett Circular Swages.

Gears, Pulleys, Sprockets, Chain, etc.

Full particulars on application.

William Hamilton Company, Ltd.,
23-24 Peterborough, Ont.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Position wanted as filer in a factory where there are band re-saws, first class references. Box 366, Canada Lumberman, Toronto, Ont. 22-23

Wanted

Position as Retail Yard Manager. Fourteen years' experience, can give best of references. Address, P. O. Box 356, White Lake, South Dak., U.S.A.

Commission salesman calling on Ontario trade, would like a connection with good manufacturer or dealer in Pine and Hemlock who can fill orders. Box 377, Canada Lumberman, Toronto, Ont. 23-1

An expert salesman and inspector with good connection throughout Ontario, at present employed, but will be open for a situation January first. Address, Box 365, Canada Lumberman, Toronto, Ont. 22-23

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Educated Swede, with ten years experience in the lumber business, competent bookkeeper and knowing English, French, German and Swedish, desires to change position. J. K., Canada Lumberman, Board of Trade, Montreal, P.Q. 22-23

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Two log scalers, having Ontario Government License. Apply to the Sheppard Lumber Company, Limited, Waubaushene, Ont. 22-23

Don't answer this ad. unless you are fully competent to accept a position as manager of Double Band Mill cutting from thirty to forty million feet white pine per year. Give experience, reference and salary wanted. Address Box 354, Canada Lumberman, Toronto, Ont. 22-24

BUSINESS OPPORTUNITIES

WANTED—Commission connection by reliable Yellow Pine concern who can furnish all items. Ship only first class grades. Box 358, Canada Lumberman, Toronto, Ont. 22-23

WANTED—A number of responsible mill men to contract for birch and maple for 1912 delivery. Either water or rail shipment. Apply Box 240, Canada Lumberman, Toronto, Ont. 20-23

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Circular Mill For Sale

For sale, practically new circular mill on Georgian Bay. Splendid shipping facilities. Suitable for cutting either pine or hardwood, and good market for all mill can cut for next five years. Apply Box 239, Canada Lumberman, Toronto, Ont. 20-23

Saw mill and timber limit for sale, capacity of mill 15 to 20 thousand feet per day, with lath and shingle mill. Timber enough to keep it running for two or three seasons. Price $5,000; inspection invited. A bargain for some one. Write W. J. Mohr, Barry's Bay, Ont. 22-23

Wanted

A manager for a saw mill in Northern Alberta, must be prepared to take stock to the amount of $10,000, or one having a saw mill with a capacity of from 50,000 to 60,000 a day who wants location; timber will last 15 or 20 years. Manager to take full charge from stump to market. Apply Box 369, Canada Lumberman. 22-1

Canadian Timber Limits

E. STEWART (Forest Engineer)

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609.

Wanted

A stock of logs to cut for the season of 1912, or a partner having from $10,000 to $15,000 to take an interest in a well equipped circular sawmill at Wiarton, for making lumber, lath, shingles and boxes, with lots of power to run all at once, or will sell the mill at a reasonable price. Railway and boat connection. Box 177, Wiarton, Ont. 21-24

For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.
11 M. ft. 1¼ in. good basswood short, 2 to 5 feet.
14 M. ft. 2 in. good basswood short, 2 to 5 feet.
50 M. ft. 1 in. M. C. Ash.
50 M. ft. 2 in. M. C. Ash.
GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale

Sawmill and Shingle Mill in active operation and thoroughly equipped with A1 up-to-date machinery in first class condition. Timber on all sides. Exceptional opportunity; $1,600 cash, $1,600 in 6, 12, 15 and 18 months. Can secure eighty acre cut of virgin timber, thirty yards from mill if desired. Write D. McNair & Son, Whitewood Grove P. O., Ont. 23-2

FOR SALE

Saw mill, capacity fifteen M. ft. per day. Two thousand acres timber, consisting of hemlock and hardwood. Mill limits located on Mary Lake, Ont. Timber scowed to Huntsville, G.T.R. Considerable timber to be bought. Reason for selling, the executors are winding up estate of the late W. Parker. For further particulars apply to F. H. & E. F. Parker, Parkersville, Ont. 20-23

Business Opportunity

WANTED—A man with $15,000 to $20,000 to buy and run a mill business in the Province of Quebec, with sufficient capital to buy every year 40,000 to 50,000 logs. Lumber may be exported by vessels to England or United States, or by rail to the United States. A wharf 400 feet long will be built in the locality by the government and could be contracted. Tenders asked. For particulars, apply to Box 346, Canada Lumberman, Toronto, Ont. 21-21

A Going Lumber Business

In the Republic of Panama

We offer for sale at a very low figure, one of the choicest mill and timber propositions in the Republic of Panama. It is a going proposition and consists of mills, railroad and equipment, logging outfit, buildings, boat, barges, etc., and a tract of the finest hardwoods to be found in that country, which will cut from 1½ to 2 billion feet. This proposition is located on navigable water. The entire cut can be contracted at good prices. This proposition is worthy of attention and will stand the closest investigation. Shall be glad to furnish further data on request.

J. W. ROBINSON,
Wells Building,
22-1 Milwaukee, Wis., U.S.A.

MISCELLANEOUS

I have a Newfoundland limit for sale about one hundred square miles, well watered and close to railway; price moderate; chiefly spruce and pine. Write B. T. R., care Canada Lumberman, B34 Board of Trade Bldg., Montreal, Que. 22-1

Hints for Packing Cases for Export

A wrinkle worth noting with regard to packing cases is mentioned in a United States consular report on trade in South Africa. Every shipper knows that the strain on a packing case falls most severely on the ends, and where the contents consist of small and heavy articles there is great danger that with rough handling the case may arrive at its destination in a damaged condition. To avoid this, some American manufacturers put double ends to their cases, and arrange these so that the grain of the wood in the two pieces runs in an opposite direction.

Increased Use of Odd Lengths

An investigation carried on last year by the United States Department of Agriculture, co-operating with lumber manufacturers in the South, to determine the saving that can be effected by using odd lengths of lumber as well as even, has begun to bear fruit. That investigation showed that a material savinv was practicable, and at a recent meeting of a Southern manufacturers' association the fact was brought out that a beginning has been made in putting the new plan into practice; and that an increase in the sale of odd lengths is anticipated for the near future.

It was formerly the custom, and generally is so still, to sell lumber in even lengths only. Waste resulted from cutting off the ends of odd lengths to make them even. A considerable percentage ends must be cut from even lengths to make the timbers fit. Some manufacturers of flooring successfully sell odd and even lengths, thus lessening waste in woods, at the mill, and in the construction of buildings.

Substitute for Mahogany

Few users of the beautiful wood known as mahogany realize that less than one-third of what passes for mahogany is the genuine thing. About forty million feet of so-called mahogany is consumed every year in the United States, while the cut of real mahogany is only about eighteen million feet. The government scientists who write about things like this say this does not mean so much that deliberate deception is being practiced as it does that the demand for true mahogany greatly exceeds the supply. The earliest use of true mahogany as a furniture and finishing wood began in 1724, and the available supply has been greatly depleted ever since. More than 20 mahogany-like woods are now offered as the genuine article, and several other woods are cleverly stained to imitate mahogany.

The forest service of the United States has just issued a monograph to inform the users of cabinet woods of the distinguishing difference between real mahogany and the best imitation now on the market. The trade name of this wood is "Columbian mahogany." It is so called because it comes only from Columbia, and it is not mohagany at all, but belongs to the monkey pod family, Lecythigaceae, and is technically known as Carinina pyriformis. Columbian mahogany and true mahogany are botanically unlike as an oak and a maple, but a superficial resemblance in the grain and color of their woods has made it possible to substitute the Columbian wood for the other.

How long this wood has been used in the United States it is not known. It has been exported from Cartagena, Colombia, to Havre, France, for more than 30 years, and there sold to immense cargoes as genuine mahogany. Practically all the Colombia mamogany now marketed is cut at points from one hundred to two hundred miles inland and shipped from Cartagena. The trunks of the trees are straight and cylindrical, with a diameter of from 24 to 70 inches, with an average of about 36 inches, and often with a clear length of 50 feet.

Use of Plywood

An English contemporary says that plywood has been on the English market for years and has been used almost alone for chair and stool seats. In its use for chair seats, plywood has had perhaps as successful a career as could be hoped for. It has competed with other chair bottoms and with the older types of wood frames such as have been used in meeting and school rooms.

Plywood for chair seats has been used almost entirely for bentwood chairs, which have come into large use within the last five years. Of late there has been a visible broadening in the trade in this wood and it has become clear that trade has possibilities of much importance to dealers in furniture woods.

In speaking further of the possibilities of its extension in the various woodworking trades, the article tells of a large, lofty apartment in an old English home which is being preserved as an example of English wainscoting. The walls are completely covered with solid oak and panelled, and at the top is a massive built up cornice. This practice of wainscoting walls with oak was formerly an old English style, at one time very common. The discontinuance of this feature of house construction was due to the cost of the wood and of the work of framing and wainscoting. With the extensive introduction of plywood squares and pan-fashioned style very probable. With this fact realized it would open up a new use for hardwoods.

In regard to the use of this wood for door panels, it is very likely that there will be some substitution as the new light face wood will take the place of the usual panels.

The new plywood is beginning to make its way into larger use and it looks as though its introduction into the United Kingdom is going to be an advantage to the timber trade.

Review of Current Trade Conditions

Ontario

Trade conditions in Ontario are slackening off a little on account of the approach of the holiday season. There are indications of a slight stiffening of prices on account of the early close of navigation which is leaving a number of the distributing yards short of stock. The same conditions apply also to the retail yards in many cases. Lumber that is located at railway points and which can be shipped throughout the winter will therefore, in all probability, be enhanced in value. Some of the Toronto wholesalers who were expecting stocks from the Georgian Bay district report that quite a percentage of it will be hung up during the winter, at the mills, on account both of the shortage of vessels and the early close of navigation. The month of November was an exceptionally strenuous one for the vessels on the inland lakes.

The general tendency so far as pine, hemlock and spruce are concerned, is upward. While there is not any noticeable advance, there appears to be a scarcity of certain sizes and lengths that will probably bring about an advance in price and possibly cause a sympathetic movement in other sizes and lengths. No. 2 and No. 3 pine lath and No. 2 hemlock lath are scarce. Prices are firm. Several large contracts for government dock and crib work are looming up in Toronto and are likely to make a good demand for a large quantity of hemlock.

Cold weather is reported from the Georgian Bay district and good sleighing is general. Several companies have already commenced their sleigh hauls and one company made a record, so far as it was concerned, by commencing the sleigh haul as early as November 22. Enquiries for hemlock are fairly numerous for this time of year. The approaching provincial elections do not seem to be having any effect at all upon trade. Since the Dominion elections, there has been a decided improvement in the movement of lumber of every kind. The most distinct feature of the trade at present is the tendency towards advance in the prices of mill cull pine. It is expected that they will gradually stiffen until the spring. Old stocks are being pretty well worked off and the cut is a little short of last year. In the Ottawa valley it is considerably short. It is probable that the difficulty in getting men for the camps will reduce the cut in the woods during the present winter. The larger operators have found it very hard to get men. A few are beginning to come back from the west now, but they are a little late to prevent a reduction in the cut as already there have been three months cut put in and they will soon begin to haul the cut now.

A sharp demand is reported in Southwestern Ontario for mill cull pine. Prices are ruling firm and there is a tendency towards advance. A similar tendency is noted in norway and red pine, piece stuff. The United States markets are developing a better demand for cull pine.

Eastern Canada

The demand for spruce at New York is not so active as it was a short time ago. An effort is being made to keep prices on an improved basis but some shipments are offered at a decline of about $1 from the higher prices which recently prevailed. There is a fairly strong demand for 2 x 9 with the price at $26. Boat orders have been bringing $24.50 but some stocks have been offered as low as $23. At Boston there is a firmer feeling in the demand for spruce and most of the manufacturers are looking for increased prices. Those who sell through dealers are asking $24 for frames and have secured this price in several cases. Offerings are light and prices should advance if even a normal demand continues. Retailers have been unwilling to order anything except small lots. A firmer tone has developed for random but the actual demand has not shown any increase. Prices of covering boards are firm and the demand is fair. Birch and maple at New York are holding their own. Plain oak is a ready seller. At Boston plain oak is quiet and quartered oak is easy. The demand for maple is not large but prices are steady. Hemlock orders at New York are more numerous but only for small quantities. There is a little more strength in the general situation but future buying is quite limited. At Boston, the demand for hemlock boards is firmer and prices are advancing. Stocks of dry lumber are decreasing and manufacturers are holding at firm prices. For eastern clipped boards, the asking price is $20 in some cases, but business in car lots at this figure is rare. Manufacturers are asking $19.50 for eastern stock and $19 for northern boards.

The Boston market for shingles is firmer and prices are higher in some cases. As high as $3.60 has been paid for good cedar extras but the bulk of the business is at $3.50. Clears are not offering in large quantity and prices are firm. The Boston market for lath shows a better demand and prices are fairly steady. The asking price for 1⅝-inch is $4 to $4.15 and for 1½-inch from $3.45 to $3.50.

Great Britain

The c.i.f. market for spruce deals continues firm and if any change occurs in the near future it is likely to be in the direction of higher prices. It is believed that a fair amount of stock is available for winter shipment. Freights continue firm and will probably have a distinct influence on the prices of liner parcels. The spot market at London is of a dull nature, as purchases for the season are practically complete and transactions for the new year are rare. A feeling of confidence prevails in the market, as the stock on hand shows no prespect of increasing beyond the market requirements. Receipts at London, for the week ending November 4, totalled 8,553 standards, as against 7,854 standards, for the corresponding week of last year.

At Churchill & Sim's recent auction sale 3 x 9, 3rd Quebec spruce brought £10 5s. For 3 x 11, 14 and 15 ft. pine, the price was £23. 3 x 11 Quebec spruce, 4th, brought £9, 10s.

A satisfactory trade is reported in softwoods at Liverpool though no great activity is noticeable in any particular branch. The spruce deal market continues firm and the present ruling prices are from £8, 5s. and upwards c.i.f. for ordinary specifications of 70 per cent. of 3 x 7 and 3 x 8 and 30 per cent. of 3 x 9 and upwards. The high cost of freight and the difficulty in securing tonnage are illustrated by the fact that a steamer was recently engaged at 48s., 9d. per standard, from St. John, N. B. On the spruce spot market, importers appear to be fairly busy, though this is possibly accounted for by the after effects of the recent strike. The demand at present seems to have fallen off and orders for any large quantity are scarce. There is a fairly active building trade. The case-making trade is busy and the prospects for it are good.

Stocks at Manchester are slightly greater than those of a year ago. Birch spot values continue unchanged with a fairly good demand all round. Stocks of planks are less than they have been for years, but the stock of logs is much greater than usual. Building operations at Manchester are decreasing, on account of the shortening of the days and the cold weather. There seems to be very little buying in progress and prices remain about steady.

The trade at Glasgow is moderately good and the improvement has been fairly maintained. Merchants show quite an inclination to lay in stocks and recent shipments have therefore been disposed of fairly well on an ex quay basis. The situation in spruce however, remains rather unsatisfactory and the competition of Riga deals is becoming acute and keeping down the values of Canadian goods. Yellow pine is in fair demand more particularly in higher grades of deals and sidings, stocks of which are light. High grade yellow pine has become very dear and substitutes are frequently taking its place.

United States

When one considers the fact that trade at this season of the year is largely of a hand-to-mouth character, it is evident that the quantity of business in progress in the United States is fairly satisfactory. Prices are being held quite well in view of the condition of the demand. The heavy storm which recently swept over the northern half of the United States from the Pacific to the Atlantic and which was followed by extremely cold weather had the effect of putting a stop very largely to outdoor work. The building activity and the resulting demand for lumber has accordingly decreased and the probabilities now are that the lumber trade, so far as it is affected by construction work, will not recover to any great extent during the balance of the year. The lumber trade is approaching a winter basis and the demand for yard stock has decreased. Most of the dealers have secured the bulk of the stock which they will need during the winter.

Chicago:—The receipts of lumber for the week ending Nov. 11 totalled 45,206,000 feet, as against 40,121,000 feet for the corresponding week in 1910. The total receipts for the year to date show a decrease of 410,822,000 feet as compared with the corresponding period of 1910. The shipments from Chicago, for the week ending November 11 were 16,622,000 feet, against 14,113,000 feet for the corresponding week in 1910. For the year to date the shipments show a decrease of 165,378,000 feet, as compared with the corresponding period of 1910. The receipts of shingles showed an increase for the week, but the total receipts and shipments for the year to date show a decrease, as compared with 1910. White pine products are in fair demand at firm prices. The yards will probably have about the usual supply on hand, for the winter trade,

SARNIA, ONTARIO

and the demand is just about what it was a year ago. There is plenty of low grade stock, No.'s 4 and 5 and prices remain firm, although the demand is letting up. A rather uncertain condition prevails in the hardwood market. Buying is much quieter than was expected, but an improvement is looked for after the first of the year when consumers have completed their inventories. The best demand is for plain oak and it is not unlikely that a scarcity of stock will develop this winter. There is a fair demand for quarter sawed white oak. Birch and maple are the most active among the northern woods. Basswood is dull and practically uncalled for. Hemlock buying for mill yards continues in fair quantity and it is reported that the input this winter will not be so much as last year. These conditions indicate that a stronger market may be expected next year. Yellow pine has been quiet during the last fortnight, the yards taking only what they need for immediate shipment. This is accounted for by the approaching inventory time and the uncertainty of prices. Red cedar shingles are in very little demand and production has been curtailed accordingly. Prices are low at $2.97 for clears and $2.49 for stars. There is a fair demand for white cedars and stocks of the better grades are light. Lath are strong at firm prices. Cooperage receipts are light but sufficient for the demand. Prices remain about steady.

Buffalo:—The northern pine trade has been fair during the past fortnight and some of the yards report a larger amount of shipments out, than in. Most of the yards have received their full supplies for the season and assortments are in good shape. The building demand has improved of late. The hardwood trade continues quite satisfactory for this time of year. The demand from the furniture factories has increased but is still on a rather small scale. Prices in general are well maintained. Oak, maple and birch of the better grades are especially firm. The demand for quartered oak is rather uncertain and inclined to weakness. The yards are well filled with hemlock lake stock, for the winter trade and assortments are fairly complete. Receipts have not been so large as a year ago and firmer prices are hoped for, although present quotations are low. There are indications of an improvement in the demand for shortleaf pine and prices are firm, especially in the lower grades. The building demand for longleaf continues unsatisfactory for this time of year. Prices are firm and the stock is well held. A fairly active trade is reported in shingles. Lake shingles have practically ceased to arrive and stocks are large. Prices continue low and show little change. The prospects of the slack cooperage business are rather dull.

Bay City:—There is a moderate movement in white pine. The receipts by lake during October were lighter than usual on account of unfavorable weather. Local mills and factories have been able to continue a fairly satisfactory activity. Box makers have sufficient contracts on hand to keep them running satisfactorily. Sash and door and similar industries are moderately active. Prices are steady. Indications are that a considerable amount of lumber bought for Bay City and Saginaw markets at the Georgian Bay ports will be held over there, during the winter. The best demand has been for coarse lumber. The movement of hardwoods continues active and the volume of business and the prices are satisfactory. Stocks of dry maple are shorter than a year ago. An excellent demand exists for beech and there is a good movement in basswood and birch.

Market Correspondence

Montreal Trade on Winter Basis

Montreal, Nov. 25.—With winter conditions prevailing, business has naturally fallen off, but considering the time of the year it must be considered of a satisfactory character, although here and there complaints have been made that the market is dull. A large amount of lumber has been rushed into Montreal in order to avoid the higher freight charges. With stock-taking so near at hand there has been no inducement to buy for immediate delivery, the tendency being to reduce rather than increase stock. As a rule, local dealers state they have no reason to complain of the general outlook and they are looking forward to a big business next year, basing their hopes on indications of heavy building operations and the general prosperity of the country.

Lath continues very stiff, while there has been a strong call for cedar railroad ties. Trade in hardwoods is reported good, with an increasing demand for plain oak and chestnut. Quartered oak, however, is slow. Dimension timber has been quiet again.

The head of one firm doing a large trade in spruce, in summing up the situation, stated that the domestic demand was very good towards the end of the year, but for the United States it was indifferent all along the line. Authorities over the border prophesy an unsatisfactory market for 1912 with prices ruling low.

The navigation season officially closed on the 25th and shippers to Great Britain are now very quiet. They had the usual busy time just before navigation closed, rushing lumber to the other side.

Since the last reports there has been a continued demand for all kinds of paper and pulp. In writing papers there is still complaint of poor prices, and in kraft papers, competition is very keen.

There is apparently a considerable reduction in the stock of news paper in the United States, and from enquiries made on this side it looks as if news will be scarce and prices much higher before the spring waters bring increased power for paper-making.

It is almost impossible to obtain ground wood for spot shipment, and manufacturers are engaged ahead very heavily at high prices. Water for grinding pulp in the Province of Quebec is still low, although there has been a slight improvement lately.

As winter conditions now prevail there is not much probability of any increased water supply. It is, therefore, pretty safe to say that quotations for ground wood will advance during the winter.

In chemical pulp the market has lately received a decided impetus with advancing prices. Winter will probably see a severe shortage in unbleached sulphite, while bleached is very difficult to secure.

Steady Trade in United Kingdom

A Fair Demand in Progress—Strike Influences Passing Away—Good Prices for Pine at London

Liverpool, Nov. 16:—In the London district and at the principal ports of the United Kingdom, business in the timber trade appears to have settled down to a steady run with a very fair demand. The rush which followed the strike period has subsided and the business which is now being done is of a normal and steady kind. The building trade is quiet in London and in the provinces so that the consumption of timber in this trade is now on its early winter scale. In the non-season trades, furniture making and packing-case making, and in the ship-building, coal-mining and soap-making industries which use much timber, the consumption of the different kinds of timber used is going on actively and on a large scale. Ths compensates somewhat for the falling off in the building trade for the time being.

At London, in the sales by auction, yellow pine and whitewood have sold freely at good prices. Spruce has also met with ready buyers and prices keep very firm. Floorings have been in good demand and the stock is now in small compass. At Cardiff the demand for deals and boards is moderately active. Sales of pitwood have been brisk and on a large scale and there is now a shortage of this wood.

At Birmingham, one of the more important of the inland centres of industry, the sales of yellow, red and white pine have been on a moderate scale but the demand for round wood and pitwood has been brisk and continuous. Local stocks of timber of these kinds have been much reduced by the steady and heavy calls made upon them. Prices are firm all round, in this market, and a good close of the year is being looked forward to with confidence.

St. Lawrence Parcel Season Ended

At Liverpool, interest centers on the closing of the Canadian import trade, from the St. Lawrence. With the sailing of the Virginian, of the Allan Line, on November 10, the mail service between Liverpool and Montreal was regarded as coming to a close for the winter months. This will put an end for the time being to the importation of the liner-parcels of timber from the St. Lawrence ports. The stock of Quebec and yellow pine deals at Liverpool is now small, but the consumption is only limited. Prices are very firm and rather more money is being paid for the best qualities of these woods. Quebec spruce is still in small supply, while the consumption of this wood is on a very fair scale. New Brunswick and Nova Scotia spruce deals have been in good demand, and stocks are within a moderate compass. In pitch pine the demand for sawn timber has improved but hewn timber moves rather slowly. Pine lumber meets with a good sale. Birch continues to sell freely. Logs have passed into consumption as they have come to hand. Planks have sold steadily and the prices of logs and planks keep very firm.

At Manchester, the consumption of pine and spruce deals has been moderate. Quebec board pine has been in good demand. Sawn pitch pine has sold more freely but a heavy stock of this wood is in hand. Pitch pine planks have sold on a moderate scale. Birch planks and logs have been in fair demand and stocks are well in excess of present requirements. Trade in the district is thriving

so that the prospects of the timber trade, so far as the demands from the timber using industries are concerned, are now good. Three-ply wood has lately been in large demand, the use of this wood having increased of late in the district.

At Hull, orders have reached the yards in a way which has been re-assuring. Yellow and red pine and spruce have passed steadily into consumption. At this town as at Manchester, plywood has attained a firm position and is in good demand. The wood has been in short supply of late owing to a delay of expected consignments in arriving.

Active Business at Tyne Ports

At the Tyne ports, ship-building and coal-handling are going on actively, so that trade in the district generally is good. This is causing a very fair demand for deals and boards, and a large demand for pitwood. The outlook for sawn timber in the district has improved.

At Glasgow, the ship-building industry continues active and is making satisfactory demands for deals, deck planks, teak and other wood for fittings. Railway-carriage and truck building are proceeding briskly and are causing demands for fairly large supplies of oak, ash, teak, elm, mahogany and other woods. As regards the general consumption of softwood in the Glasgow district, this is rather quiet. The building trade is making but little demand for timber but a fair amount of joinery work and of case-making is in progress, and is serving as a useful counteractant to the quietness in the building trade.

Cash Value of Paving Blocks

Liverpool, Nov. 15:—The revival of interest in wood as a material for street paving, which is now so noticeable in the United Kingdom, is bringing out points and facts of value to those who supply blocks for paving, whether of hard or soft wood. Quite a large number of tenders for supplies of wood blocks have lately been accepted by the London County Council, and may be taken as showing the value, at date, of such blocks. The variation in the prices for blocks of a given size noted hereafter, are mainly due to quantities of blocks having to be delivered at different points within the area controlled by the County Council, though in some cases it is owing to differences in the quantities required to be supplied. The following were some of the accepted prices: For creosoted deal blocks: 3 in. x 9 in. x 4 in., per 1,000, £5 18 8, £5 16 4, £5 15 8; for 3 in. x 9 in. x 4½ in.,£6 15 2, £6 10 6, £6 9 9 and £6 9 6; for Jarrah wood blocks, 3 in. x 9 in. x 4½ in., per 1,000, £11 1 0, £10 19 0, £10 17 0; 3 in. x 9 in. x 4 in., £9 16 10, £9 16 6 and £9 12 6; 3 in. x 6 in. x 3¼ in., £5 15 and £5 14 9. The large use which is now being made of wood blocks for paving by the London County Council is sure to lead to an increased use of such blocks in the larger cities of the United Kingdom, as London's example in cases of the kind is almost invariably followed by cities in the provinces.

Measurement and Acceptance of Hardwood

Liverpool, Nov. 16.—The subjects of accuracy in measurements in the buying of timber, fair averaging, proper allowances and rejections, have been in the fore front of trade topics in the United Kingdom for a long period. Representations on one or another of these topics have frequently been made between importers and merchants, and within the pale of the Timber Trade Federation, with a view to securing greater accuracy and equity in practice as between seller and buyer. The National Timber Exporters' Association have now the subjects named before them, and are intent on securing the adoption of an improved standard of practice. Proposals to that end were submitted by the National Lumber Exporters' Association at a meeting of the Hardwood Section of the Timber Trade Federation, at the offices of the London Chamber of Commerce, which were as follows:—

(1) In taking the thickness of all American lumber, same to be taken one foot from the thinnest place. (This rule has been adopted by Liverpool, and has been in use there for some time).

(2) In case not more than ten per cent. in plain oak and twenty per cent. in quartered oak, should be 1/16 of an inch scant in thickness, no notice to be taken and the parcel as a whole to be considered full thickness.

(3) Where shipments are found by the Port authority to have the superficial contents marked on each piece in figures, such figures must stand; or, alternatively any pieces with the measurements of which the port authority disagree, shall be laid aside for inspection, shippers paying the necessary expenses.

(4) Where the variation in measure does not amount to more than one per cent. no claim for shortage is to be made, provided the lumber is measured full contents according to the Board rule.

This is understood to apply to one inch thickness and up, and

similarly it is suggested that in case of ¾ and under 1/32 scant, should be considered full thickness.

The clause of the foregoing which will prove the most contentious is No. 3. This, as providing that where contents are marked on each piece the figures of such marking must stand, presumes, of course, the accuracy of the figures given, a presumption which the latter part of the clause clearly indicates will be open to challenge, and probably will be challenged in many cases.

The clause specifically provides that in the case of measurements with which the Port Authority may disagree, the pieces concerned shall be laid aside for inspection, "shippers paying the necessary expenses." This proviso will certainly not be acceptable to shippers. They will not be the dissenting parties, but will be required to bear the expense of placing pieces of timber on one side and of inspecting and measuring the pieces to which the port authority may take exception. The Authority will recognize that it is to their interests to take as few exceptions of the kind as possible, and, on the other hand, importers and shippers will take every precaution to insure that the figures marked on pieces of timber are accurate. Yet even this will not eliminate the possibility of error, and the likelihood of the figures on some pieces being challenged and of pieces having to go back for inspection. Clause 3 has, accordingly, given the hardwood dealers something to think of. It is possible that they may accept it in the spirit of the good old trading principle that "There must be give-and-take in business," though one can hardly expect them to do so.

British Columbia Logging Conditions

In the logging line things are slackening off for the winter, some of the camps have already closed down and most of those that are running are preparing for the winter close-down. All the mills are well stocked with logs and there is quite a surplus in the hands of the loggers. Good camp run of fir logs are sold at about $8.00, cedar from $6.00 to $10.00, according to quality. Nice clean run of shingle cedar is offered here at $6.50 per M; spruce is scarce at about $9.00. The outlook for the next season's trade in the Northwest is so doubtful that the mills here are not buying in excess of their immediate demand, and unless there is some change in the situation logs will not advance in price until well on into next March.

The Northern Hemlock and Hardwood Manufacturers Association have sent out the following report on Dry No. 3 Hemlock:—

Reports from 78 firms in response to the inquiry of November 14, regarding stocks of dry No. 3 Hemlock are summarized as follows:

On hand now ....38,418,000 feet.
On hand this time last year ....71,737,000 feet.
Decrease—46 per cent.

A few firms are pessimistic as to the outlook for the market on such stock, but most of them say that the prospect is good. Some additional comments are:

"Very much improved within the past 60 days."

"Think scarcity of this stock will mean an advance."

"We feel like holding our No. 3 for better prices."

"Better than we have seen it for the last three years."

"We are turning down orders almost every day."

"Brighter—More inquiries for No. 3 Hemlock of late."

"We sold our No. 3 Hemlock for not less than $7.00 last year, and are refusing orders now unless price nets us $7.00 here at the mill. We see no reason for quoting less than $7.00 on No. 3 Hemlock as No. 5 pine is netting us not less than $7.00 here at the mill."

"We will not have enough to take care of our mixed car trade."

"All our new cut is sold to be shipped as soon as dry."

"Stock way short of supporting our regular trade."

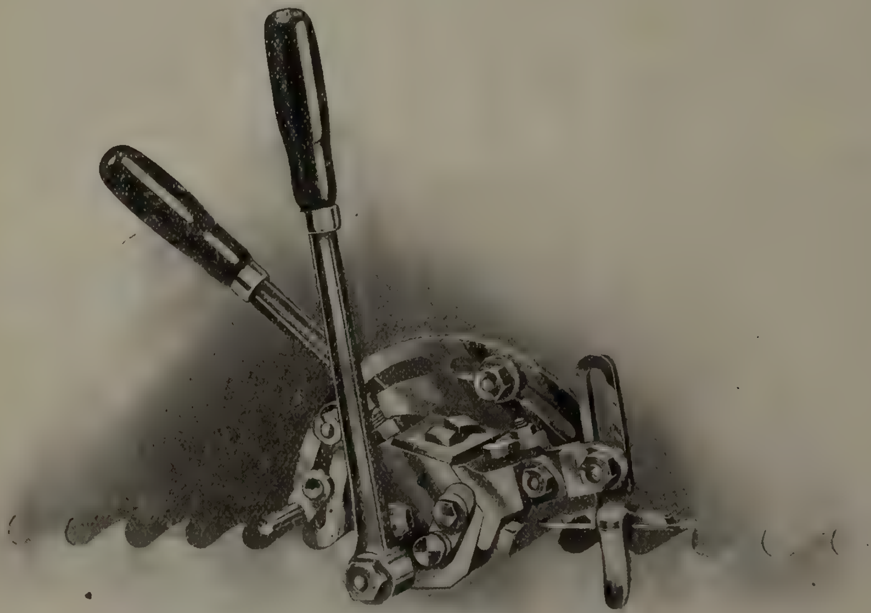
"We are holding stiff on No. 2 and 3 and some of our customers seem to be feeling that we are advancing rather rapidly in No. 3 stock, but believe that this is warranted."

"Very much improved."

"We are also pretty well cleaned up on No. 4 and 5 pine and 1 x 4 ft. tamarack, of which we had about 500 M ft. We are getting about 50 cents more for 1 x 4 tamarack than we were four weeks ago."

"We are quoting $7.00 on No. 3, and there seems to be quite a demand for same."

"It pleases us to state that we have received from $1.00 to $1.50 per M more for our No. 3 this year than we did last and present indications lead the writer to think that No. 3 hemlock as well as pine will be in good demand in the future owing to the fact that there is no dry stock available at the present time and a large demand."



The

Filing Room

Something New

For nearly 20 years the Hanchett Band Saw Swage has been on the market. There are today nearly three times as many Hanchett swages on the market as any other swage. There are over 14,000 of them in use up to this date. They are long lived too, for many of the very first ones made are still in daily use. We have now made an attachment or die lever stop whereby the eccentric die may be adjusted to not turn past the anvil or to turn past the anvil as desired. This attachment will fit on any of the older Hanchett Swages. It is neat, solid and compact. Send for Catalog No. 2.

EDGINGS

Ontario

A report from Powasson, Ont., states that the mills there belonging to S. T. Jackson, have been destroyed by fire.

Minnis Brothers' saw and shingle mill at Cobourg, Ont., was destroyed by fire recently, with a loss of about $6,000.

The stock of F. A. Scott & Son, sawmill operators, Ottawa, has been damaged by water. The loss is covered by insurance.

Louis Fiegehen's sawmill in Collingwood. Ont., was recently destroyed by fire. The loss amounts to about $4,000. The mill will be rebuilt at once.

Messrs. Bartram Bros., Limited, Ottawa, Ont., have increased their capital stock to $50,000, to meet the demands of their largely increasing trade.

An office and store room will be added by J. Kaufman, Berlin, Ont., to his planing mill. The building will be two storeys, 30 x 30, concrete and pressed brick.

William Elbery, Fenelon Falls, Ont.. who operated his mill for a short time last spring on custom work, is having the mill overhauled and put in shape for more extensive operations next summer.

The sawmill. planing mill and other buildings belonging to Mr. Robt. Konkle, Beamsville, were recently destroyed by fire, at a loss estimated at about $10,000. Mr. Konkle intends to rebuild at once.

The Department of Public Works, Ottawa, receive tenders until November 29, for the supply of B. C. fir and white oak timber for the use of the dredging branch. at Victoria Island, in the Ottawa River.

A small sawmill will shortly be erected near Port Bruce, Ont., for the manufacture of lumber from timber on the farm of Messrs. Stevens Bros., which has recently been purchased by a Windsor, Ontario lumberman.

A report from Dutton, Ont., states that James Dent, of Thamesville, who purchased the timber on the Wiley Estate has leased a site from the Pere Marquette Railway Company, on which a mill will be erected at once.

The Hydro-electric Department of the city of Hamilton, Ont., are receiving tenders until noon, December 5th, for the supply of about 400 wood poles. Specifications may be secured at the office of the city engineer, City Hall, Hamilton.

It is reported that the W. C. Edwards Company, Rockland, Ont., intend to erect two new sawmills. The buildings are to be of concrete flooring with metal roofing, steam power and heating, electric lighting, and asbestos covering.

The New Brunswick Pulp and Paper Company, Limited, have received an extra provincial license from the province of Ontario, their capital for use in Ontario not to exceed $40,000. Mr. E. N. Armour of Toronto is Attorney for the company, in the province of Ontario.

It is reported that J. D. Shier & Company, Bracebridge, Ont., are considering the advisability of establishing a chemical plant at Bracebridge, Ont. There are large quantities of hardwoods in the neighborhood that would supply such a plant with raw material for many years to come.

A wood-drying kiln filled with lumber belonging to Beverley & Hillock in the rear of 91 Richmond street west, Toronto, was partially destroyed by fire recently, entailing a damage of $300 to the lumber and $200 to the building. The kiln is owned by George Clendennan and is fully covered by insurance.

The North Shore Contracting Company, Limited, Sault Ste. Marie, Ont., have been incorporated with a capital of $500,000. The objects of the company include the building or acquiring and conducting of pulp and paper mills and to acquire timber and timber lands. The provisional directors are: H. E. Talbott, Dayton, Ohio; G. H. Mead, Dayton, Ohio; and S. Warren, Sault Ste. Marie, Ont.

Mr. A. Ludgate, Pembroke, Ont., is in Prince Rupert, B.C., in the interests of the Kitsumkalum Lumber Company, which recently secured a tract of timber land containing about 500 square miles near Kitsumkalum. Mr. Ludgate will spend the winter in the bush preparing a report upon the property. The company, it is reported. will erect a mill in the near future. The president of the company is Colonel H. Mackie.

It is announced that a syndicate, headed by Charles Meredith & Company, stock dealers, Montreal, have obtained control of the Spanish River Pulp & Paper Company. Mr. H. B. Mackenzie, manager for Meredith & Company. and Mr. R. L. Innes, of The Dominion Canners, Hamilton, have been elected directors of the Spanish River Company in the place of Messrs. C. A. McCool, of Ottawa, and O. B. Sheppard, of Toronto.

The Spanish River Lumber Company, Limited, Sudbury, Ont., have leased from the Grand Trunk Railway, the Point Edward yard near Sarnia, Ont., which has been held under lease by the Ontario Lumber Company for a number of years. They have stocked the yard with about five million feet of pine and hemlock and intend to work up a Canadian trade from that point. The yard is under the management of Mr. Harry Turnbull, who was for a long time with the Laidlaw Lumber Company, and afterwards a partner of Mr. Labelle's in the lumber business in Sarnia.

Grant-Holden-Graham Limited, the newly formed firm at Ottawa, Ont., whose incorporation was announced in the Canada Lumberman of November 15th, have started a wholesale manufacturing company and intend to carry on a jobbing business. catering principally to the requirements of contractors and lumbermen. Mr. Hugh Grant, president of the company, is a Transcontinental Railway contractor. Mr. A. J. Hendry, vice-president, late of Woods Limited, has had twenty-two years' experience in this business and has a wide connection among the lumbermen of the Ottawa Valley and surrounding districts. Mr. S. S. Holden has been factory manager for Woods Limited for the past six years, and will have the management of the new factory under his care. Mr. B. W. Graham, the sales manager, is widely known among the contractors and lumbermen in Eastern Canada, having filled a position with Woods Limited, as special contractors' salesman. The factory and warehouse will be located at 145-147 Albert street, Ottawa. The company propose covering Eastern Canada with their travellers, who will call upon the trade from Sidney, C. B., to Port Arthur, Ont. Their goods will be handled in the West by Messrs. Finnie & Murray.

Eastern Canada

Bruneau & Company, lumber dealers, Drummondville, Que., are reported to have dissolved.

The Chaleur Bay Lumber Company, Limited, has been formed with the object of manufacturing and dealing in all kinds of woodwork, pulp, sawing. wholesale and retail, at the village of Port Daniel, P. Q. The capital is $200,000.

Investment Realties Limited, Montreal, have been incorporated with a capital of $150,000, to carry on business as builders, dealers in timber limits, etc. The incorporators are O. B. McCallum, A. A. Magee and T. B. Gould, all of Montreal.

The saw mill of Joseph Mignault, St. David, Que., has been completely destroyed by fire, the loss amounting to about $6,000. The mill will be rebuilt at once and Mr. Mignault will require engine and boiler, iron pillars, steam piping, planing machine, steam pump. hose, etc.

The Chaleur Bay Lumber Company, Limited, Port Daniel, Que.. has been incorporated with a capital of $200,000, to build and equip mills, etc. The incorporators are P. O. Viall, Chas. R. Taylor, both of Port Daniel, and J. W. Vickerman, civil engineer, of Cleveland, Ohio.

The Lachine Land Company, Limited, Montreal, Que., has been incorporated with a capital of $100,000 to carry on business as builders and contractors and dealers in timber, hardware and other building supplies. The incorporators are A. H. Elder, G. V. Cousins and P. F. Brown, all of Montreal.

The work of establishing a plant for the Pejebscot Lumber Company, at Martin Head, St. John County, N B., is progressing rapidly. The new booms were expected to be in position by Dec. 1. The erection of a new mill will be commenced in March. Robt. Connelly, Great Salmon River, N. B.. is manager.

An option is reported to have been secured on the Miramichi Pulp Mill, at Chatham, N. B., by representatives of Sir John Millbanks of England. Carl Riordon, of the Riordon Paper Mills, Montreal, and Chas. Read visited the plant recently to report upon it. The liquidator of the former owners is Mr. Wm. Dick, of Chatham, N. B.

The St. Maurice Construction Company, Limited, Montreal, Que., has been incorporated with a capital of $25,000 to carry on business as general contractors, to acquire timber limits, mills. lands, water privileges and to deal in all building materials. The incorporators are J. E. Aldred, Howard Murray, J. C. Smith and Thos. McDougall, all of Montreal.

The (Penn) Newfoundland Company, Limited. having for its main objects milling, lumbering, pulp and paper manufacturing, in Newfoundland, has been incorporated under the Newfoundland Incorporation Laws. The incorporators are: Messrs. R. W. Newman, Williamsport, Pa.; E. U. MacCracken, Ralston, Pa.; E. J. Dexer, Ralston, Pa.; and W. B. Stewart, Williamsport, Pa.

A transfer involving the sale of thirty thousand acres of timber lands is reported from Amherst, N.S., whereby an American syndicate composed of Perry Black, Edgar Fillmore and I. J. Soy, secured the timber lands owned by Charles and Davidson Hill, near Truro, N.S. The Hill lumber areas have been looked upon as among the finest timber producing properties in the province. The syndicate expect to cut not less than six million feet this winter.

The Roberval Paper Company, Limited, is being promoted with a capital of $1,500,000 in preferred stock and $1,500,000 in common stock, with the object of erecting mechanical, chemical, pulp and paper mills, and also acquiring timber limits on the Ouiatchouanish River. P. Q. Mr. A. Du Tremblay, the president and manager of the company, has obtained from the municipality of Roberval a bonus of $10,000, and an exemption from taxation for 15 years.

In order to cope with the sparse water supply the E. B. Eddy Company, Hull. Que., has decided to make some very expensive improvements to its power plant at the Chaudiere Falls. Engineers have been preparing plans for the last two months by which the company will secure double the power that it has now with the same quantity of water. The proposed outlay is in the neighborhood of $500,000. The Ontario Government is coming to the rescue of manufacturers along the Bonnechere River in calling for tenders for the building of a dam at Round Lake, one of the upper sources of the Bonnechere. This will also help the paper and pulp industries of Ottawa and Hull, as the Bonnechere empties a big volume of water into the Ottawa.

Western Canada

The Goose Lake Grain and Lumber Company, Regina, Alta.. has increased its capital from $150,000 to $200,000.

G. R. McColl, Winnipeg, Man., wholesale and commission dealer, is reported to be succeeded by McColl-Seymour Lumber Company.

S. H. Greenwood & Sons, lumber and implements, Elkhorn, Man., are reported to have sold the Fleming branch to H. Kirby & Company.

McDonald McLean, 428 Salsbury Drive, Vancouver, B. C., will erect a frame sawmill and barn to cost $1,700 at the corner of Rupert and 13th avenue.

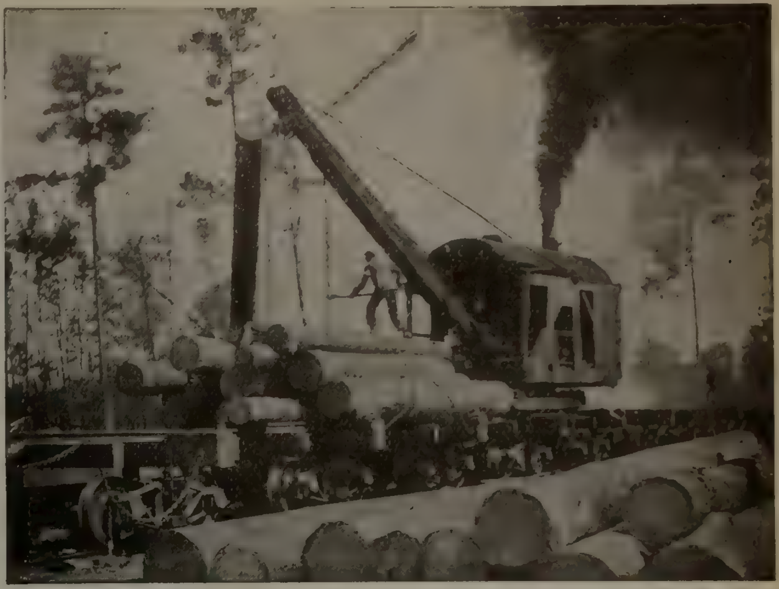
The Bellingham Bay Lumber Company, Vancouver, B.C., has been incorporated with capital stock of $500,000. B. M. Farris is Attorney for the company.

The Federal Lumber Company, Vancouver, B. C., has been incorporated, with a capital of $50,000. J. H. Lawson, Jr., barrister, is attorney for the company.

J. Hanbury & Company, Limited, Vancouver, B.C., have been incorporated, with a capital of $1,250,000, to carry on business as general lumber and timber merchants, etc.

The Council of South Vancouver, B. C., have granted to F. S. Birrell on behalf of the South Vancouver Lumber Company, permission to erect a mill on the Fraser River.

The Coquitlam Lumber Company, Limited, Coquitlam, B. C., has been incorporated with a capital of $10,000 to carry on business as timber merchants, sawmill proprietors and lumbermen.



The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

WE will make especially low prices on the following Dry Stock for immediate shipment:

COMMON and DRESSING
WHITE PINE
(NO BOX)

50 M ft. 5/4 x 8-in. and up 12/8-ft.
60 " 6/4 x " " " "
250 " 8/4 x " " " "
65 " 3 x 4-in. " " 6/11-ft.
50 " 3 x 4-in. " " 12/18-ft.

Has to be moved to close an account. Bone Dry. Let us give you further particulars.

DISSTON SAWS

ARE THE STANDARD BY WHICH THE MERITS OF ALL OTHERS ARE JUDGED

A SAW TO BE SUPERIOR IN EVERY RESPECT must be made of a steel of such peculiar quality and texture that will "take" the hardening and tempering to the greatest degree, giving the highest temper, retaining the necessary toughness and elasticity which admits the springing of the points of the teeth in the setting and at the same time being so hard that it will maintain the set and cutting edge the longest time. The blade must be ground an even thickness on the entire tooth edge, properly tapered to a thin back for clearance and the teeth of such shape as to enter into and cut–not tear–the wood.

These are the Principles on which Disston Saws are Built

Berlin Box-Factory Tools

TALK No. 8. A VERTICAL BOX FACTORY RESAW MAY

The simplest machines are most efficient because expert operation is not required to secure full capacity.

This Vertical Band Resaw, our "341," is simple to the last detail and is therefore popular.

In box factory systems where a vertical using a six inch blade can be used at all, the 341 will be found an efficient Resaw, because of its simplicity and its ability to stand crowding.

We have had dozens of letters from users of this machine and not one has contained a fault finding sentence. Nothing but praise has been given this resaw since we first brought it out.

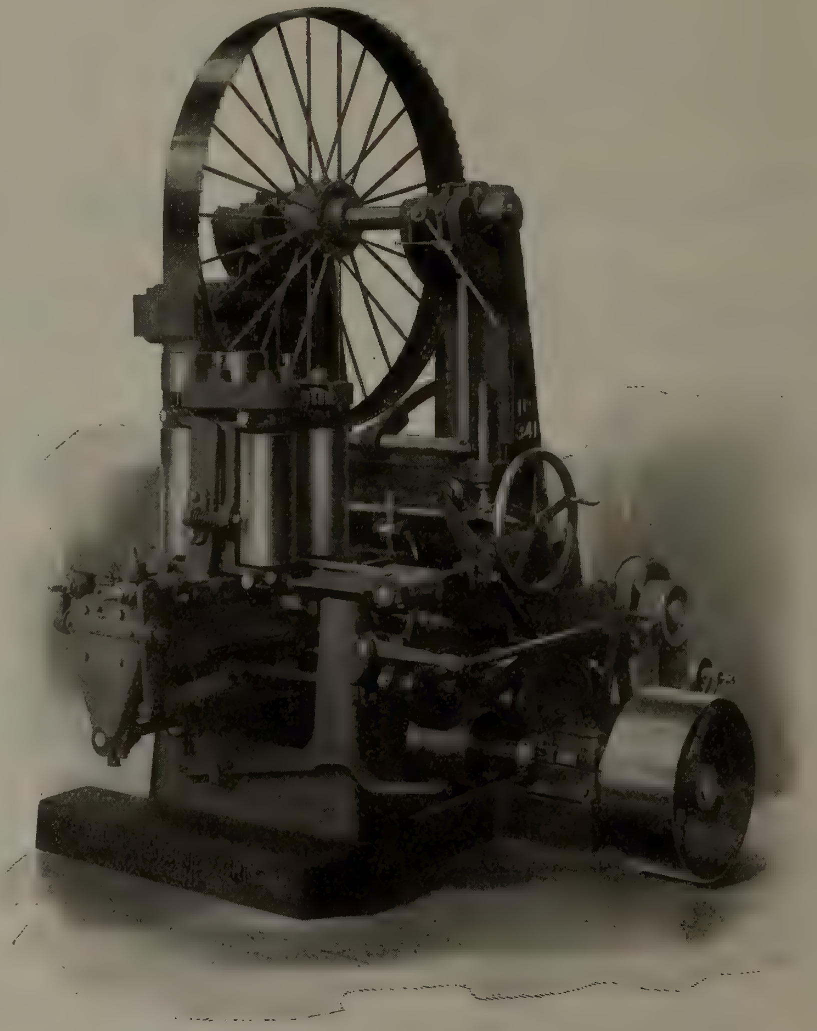
One superintendent speaking of his "341" says : "We started it on its first run with a green man operating, and several without experience have handled it since, but we have never had the least trouble."

You know of Band Resaws with which you wouldn't dare try that. Don't you? And you know, too, that the average new man in charge of the average Band Resaw with its levers and hand wheels here, there and on every side of the machine, would be so balled up on the ordinary run that he couldn't quit the job fast enough.

And the average factory can't depend on having the same man to operate any Resaw for any length of time. It's a heap safer to have a machine that the average man can run to its capacity without having to learn the job.

So the simplest Resaw becomes the most efficient in the box factory because an expert is not required to work it up to full capacity.

And the capacity of "341" is not small either. In fact, no resaw with 54 in. wheels and carrying 6 in. blades has a capacity equal to "341."



It is a closely coupled-up machine, allowing the use of a short stiff blade. This feature, together with the power given the feed rolls through the new Berlin Variable speed device affords a capacity not equalled by any Resaw with rolls friction driven.

That is a combination possible only on a Berlin Band—feed rolls heavily housed with plenty of power, and a short saw to take whatever the rolls present to it.

The Berlin Variable feed drive for the rolls has proven itself the most efficient device in use for the purpose. It stands alone in its ability to carry sufficient power to the rolls so that there is always a steady feed no matter what is going through.

Users of friction drive make the mistake of applying to large resaws a feed roll drive equal only to the light work of small Band rip saws. We discarded frictions as soon as we found a better device. Other makers still cling to the old, inefficient way.

The 341 is built Berlin way in every detail, from the one-piece base to the all steel wheels, the solidest base, and the sturdiest, lightest running wheel built.

Every feature is simple and efficient. There isn't a detail on the machine to puzzle any practical man.

It is working and giving satisfaction from Maine to Frisco, from Winnipeg to New Orleans, in Australia and in Europe. But the 341 has never fallen down on the job.

If a band Resaw with a 6 in. blade of the type described would fit into your system, ask for details of the 341. There's a circular on it awaiting your request.

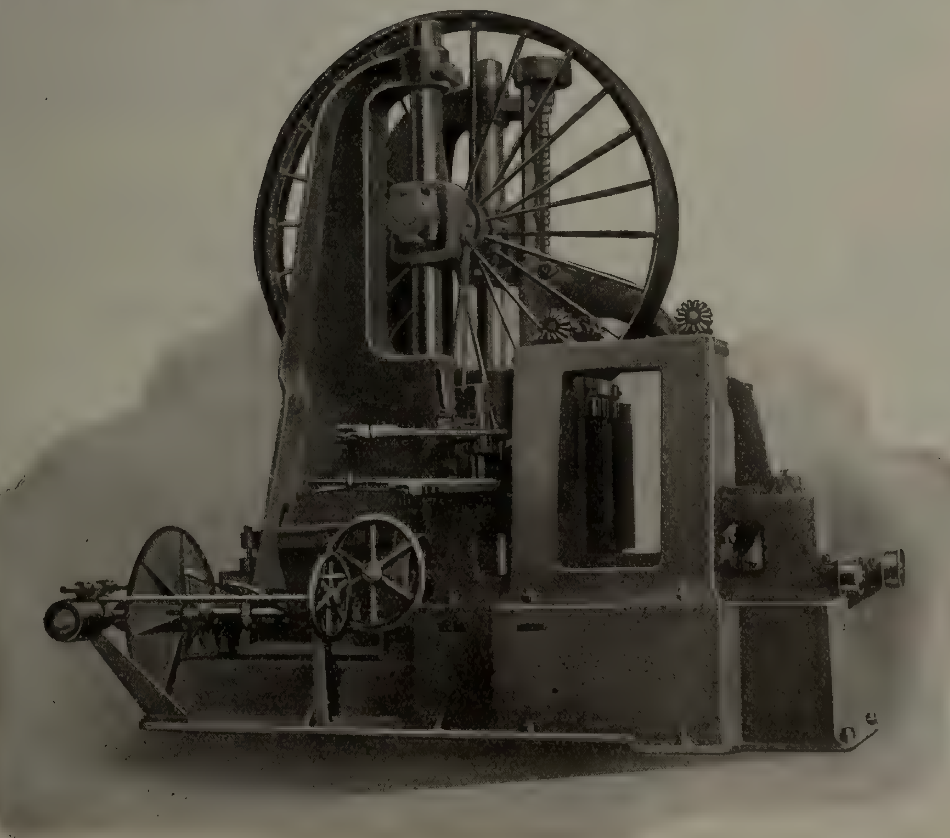
IT IS A MISTAKE TO

Install a Light Band Resaw



A 7 FOOT CLARK BAND RESAW

Just as many men are required to operate a 60" or 66" resaw using 6" or 8" saws as are required to operate a 7' resaw using 12" saws.

The band resaw illustrated herewith is capable of a continuous daily output of from fifty to sixty thousand feet of 1" and 2" lumber, every piece of which is perfectly manufactured. This band resaw in connection with transfers and return rolls will raise the output of a single band mill from twenty-five to fifty thousand feet daily and will increase the daily cut of a double band mill from fifty to sixty thousand feet, depending upon the size cants or timbers passed through it. It is a powerful and extremely rigid machine and weighs 28,000 pounds.

We build the heaviest and most complete line of saw mill machinery in the world. Better ask for catalogs.

HOW MANY ? FT. PER MINUTE

Plain Facts

150, 250, even 500 feet per minute are claims you've had dinned in your ears for quite awhile.

The question of speed has been settled—was settled—three years ago when the American No. 77 came out.

No matcher on the market will turn out more lumber "profiled" or otherwise than the No. 77—*that fact the trade is familiar with.*

We have never made extravagant claims as to speed, because it's silly—the mill man is no fool. He knows how fast it is possible to handle the material. If he's quick at handling the stock, then, 200 or more feet on the No. 77 is no trick. We usually put into our ads 150 feet and upwards per minute—because the practical limit at which the average man can handle the material is not far above 150 feet.

There are hundreds of 77's in the country today to verify our claims and *that's the real test.*

Take the style siding shown here. It's perhaps the most difficult form of two-drop to cut. The No. 77 does it—is doing it—in mills all over the South at 150 and 200 feet per minute.

The No. 77 is a growth—fundamentally it's the same as it was three years ago; but the vigilance of the man who designed it is still upon it, and it stands today without a rival.

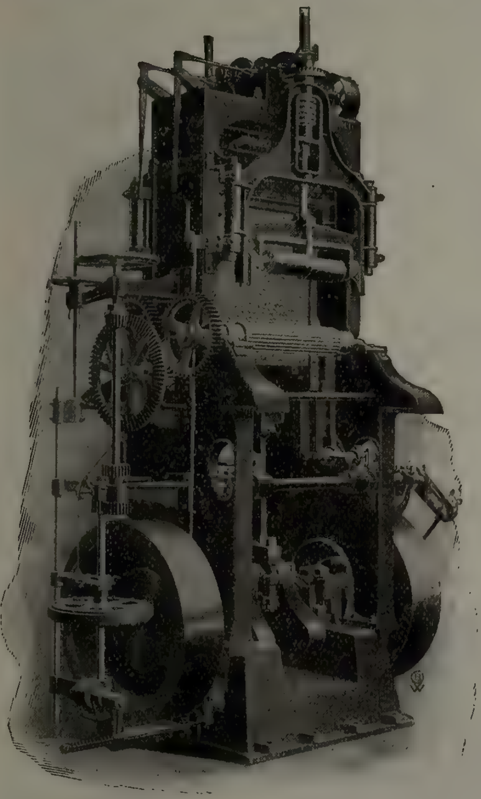
No Waste Here



A Wickes Gang will not over-slab. We wish no band or circular sawyer ever did! They are working for a record; so many hundred logs or so many thousand feet per day. So it's hustle! Let her slide! You know the pressure, and so why blame them if slabs that should have been boards go merrily on their way to the burner.

Take the pressure off by putting in a Wickes Gang. Let its multiple saws do the work more cheaply.

Let the Gang do the slabbing on two sides of the log. These two sides, at least, will yield you all the boards they contain, for

THE GANG CAN'T OVERSLAB

Timber Estimates

With increasing values in timber land, accuracy in estimates of standing timber is all important. We are practical foresters and make all estimates according to the most approved methods, assuring the smallest margin of error. We furnish forest maps showing the character and location of timber and the average stand in each, as well as the topography; also the blocking of townships in one mile blocks, a most necessary piece of work in the economic operating of timber lands.

A Large Paper Company's Opinion of Our Work

Great Northern Paper Company,
Spruce Wood Department.

Bangor, Maine, Dec. 24, 1909.

Dear Sirs,—

Your work in blocking and estimating of approximately forty thousand acres, owned by the Great Northern Paper Company, this summer, was most satisfactory. The results of such work are unquestionably of value to us in handling timber lands.

Very truly yours,
F. A. GILBERT.

We survey wild lands for the renewal of lines to prevent encroachment and to get actual acreage, the old surveys often being faulty.

We appraise for present and future worth—of particular importance to Bond and Banking Houses in connection with purchases and sales.

Our Booklet F, "Applied Forestry," will prove of interest. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

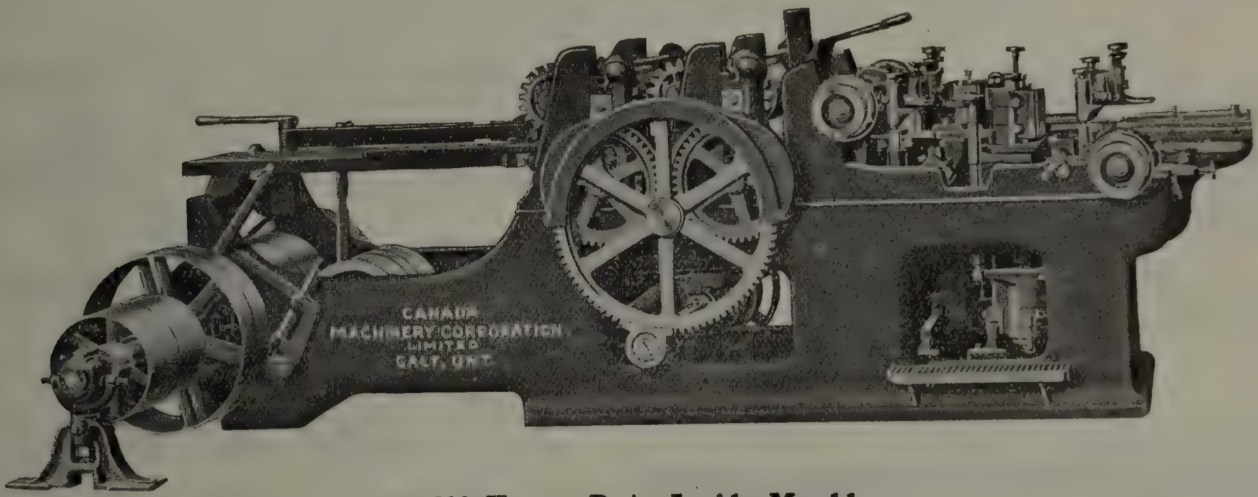
No. 300 Heavy Duty Inside Moulder

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.



No. 300 Heavy Duty Inside Moulder

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

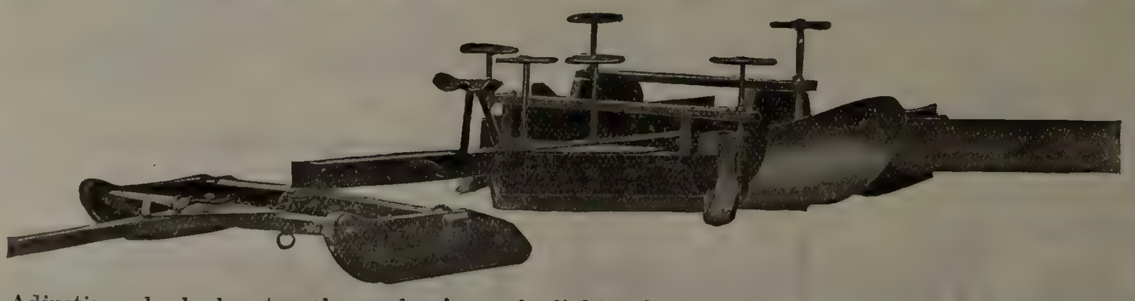
"Brazel Patent" SNOW PLOWS

Known in every Camp from the Atlantic to the Pacific as the most satisfactory Snow Plow made.



Combination Model, Lumberman's Snow Plow, can be used either with or without Rut Cutter.

One man to operate. Adjusting wheels close together make change for light or heavy work in an instant. Wings placed to throw snow 9' wider than sleigh track or narrower if desired. Height of Mouldboards prevent snow falling back on track. **Brazel Plows** cut 6" wider than logging sleighs, roll snow outside track and away from roadway. Cut off knolls, fill up holes and leave a perfectly level road. Cut off dirt and manure from an ice road leaving a clean roadbed. Roll up and push entirely away from the road, 12" of loose snow each time the plow passes over.

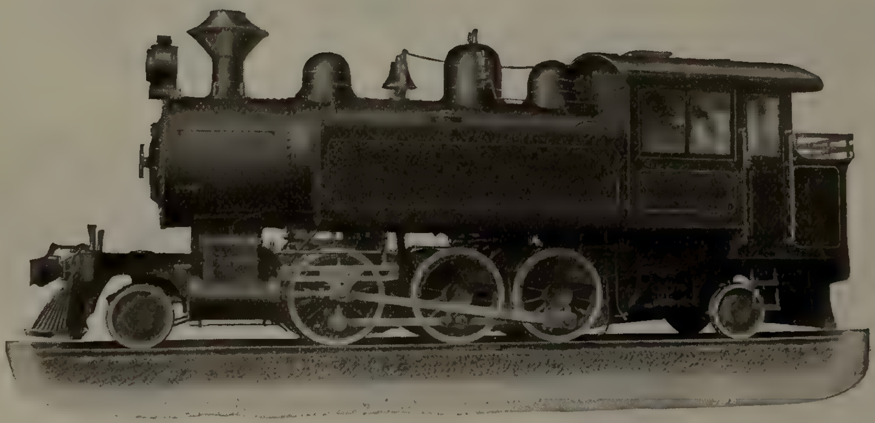
INDUSTRIAL LOCOMOTIVES



Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

Perkins' Shingle Machine

Hand Feed

THE FRAME of this Machine is Cast Iron heavily ribbed. All parts securely bolted together.

TO GIVE saw lead shift the screws in rear and front of arbor bridge pot box. No danger of heating box or disturbing alignment of frame in so doing.

TO TIGHTEN main drive belt turn the nuts on outside of L shaped standard fastened on to foundation skids. This draws the machine away from the line or counter shaft. Machine must be placed on and fastened to a level and solid foundation, one that is straight and out of wind.

BALANCE WHEEL PULLEY. Experience teaches that a pulley of this design enables the machine to be driven full capacity with a belt two inches narrower than where the balance wheel is omitted. It also maintains a more uniform motion, as the intermittent strain thrown on the arbor and driving belt in the act of sawing is overcome by the momentum of the mass of metal in the balance wheel. Pulley is turned inside and out, securing a perfect running balance. A Removable Cast Iron Cover keeps all refuse and sawdust out of the pulley.

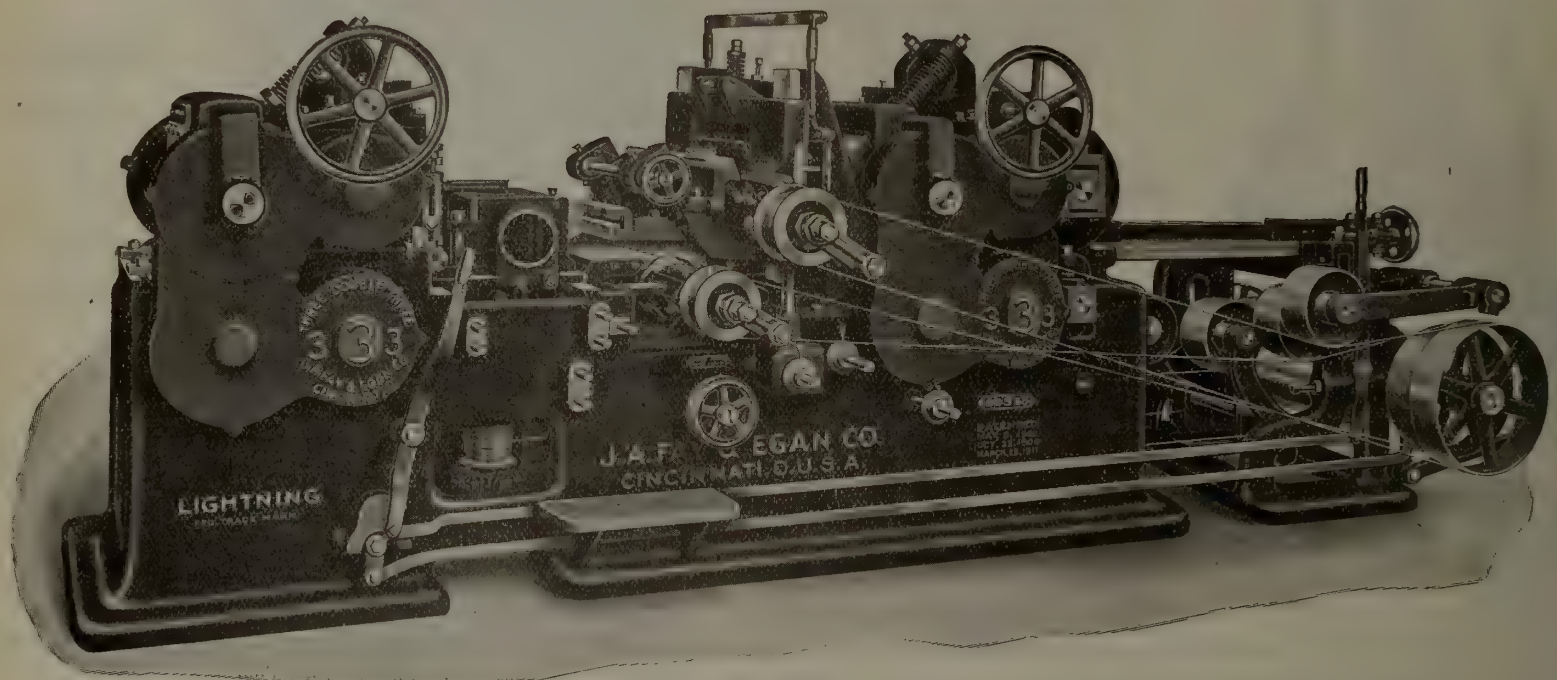
333 The new addition to the LIGHTNING LINE



NO. 333 "LIGHTNING" PATENTED PLANER AND MATCHER

The aim of the successful mill is to produce the highest grades possible at the lowest manufacturing costs. The mills that are achieving this aim are those using the new **FAY & EGAN No. 333 Planer and Matcher.** This new addition to the **"Lightning Line"** is at the least calculation 25 per cent. more efficient than anything here-to-fore attempted along this line. We can demonstrate this to you conclusively, ***first,*** by showing you the twenty-eight new and exclusive features embodied in this machine; ***second,*** by samples of work done, for instance, No. 117 siding made at 200 feet per minute, with profile attachment; it's smoother than any No. 117 ever made before at 100 to 150 feet per minute, and ***third,*** by the mills now using the new No. 333.

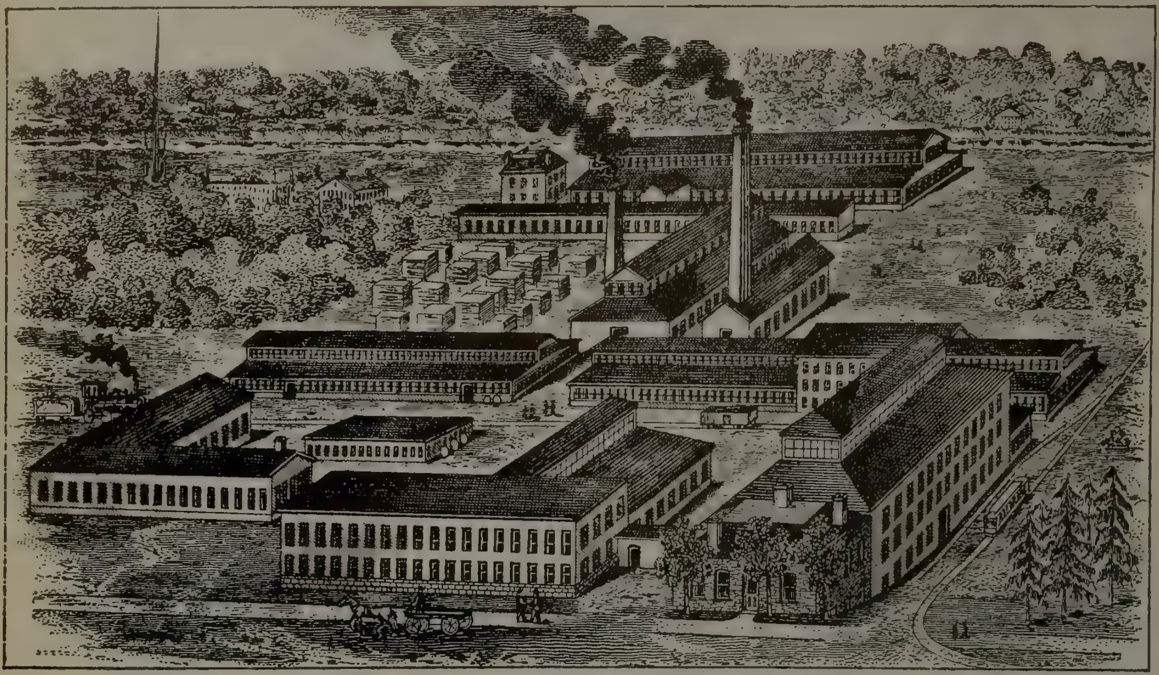
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made



The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

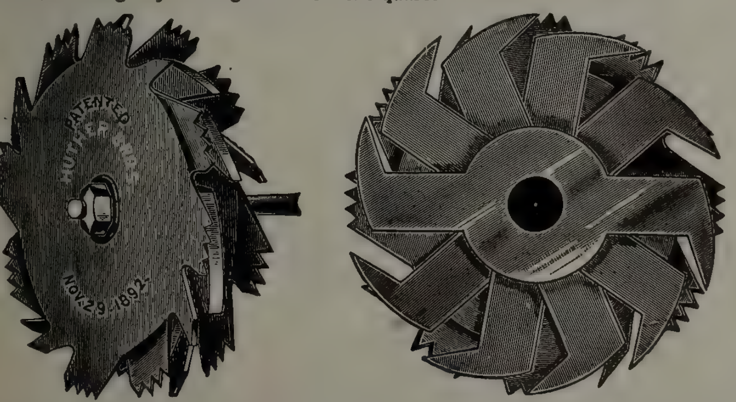
HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from one quarter inch to 2 inches or over



PATENTED
HUTHER BROS.
NOV.29.1892.

Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense.
HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturer of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

Note the malleable lift rings to accomodate poles for the portaging of the Range. This is a handy feature only found on the Favorite Shanty Range.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

32" — 2 saw edger for portable or light stationary mills

THIS edger combines more of the important points in the machine, than any other edger of its size on the market. It can be made to suit either a right or left hand mill, by taking out four bolts and turning the top of the machine around, which does not disturb the mandrel. The top rollers are self raising, and raise towards the rear of the machine. This makes it impossible for boards to fly back out of the machine. The end bearing may be removed, which allows the saws to slip off the end of the mandrel, without disturbing it in any way. There is a top roller, which is convenient for passing boards back over the top of machine.

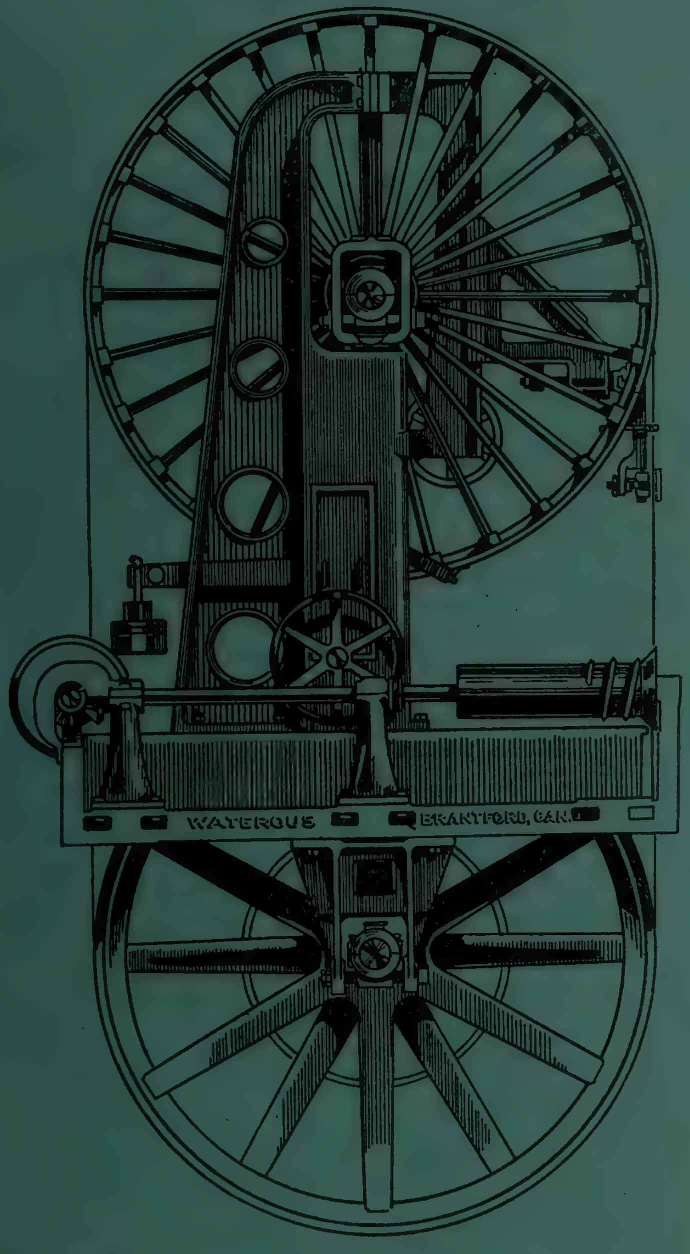
"WHY" and "HOW"

We Build a 7 ft. Band Mill



WHY—

Because there is a demand for a mill that will handle logs of fairly large diameter—that, is larger than can be cut on a Pony Mill—that will cut faster than the Pony and at the same time will be less expensive than the heavy 8 ft., 9 ft., and 10 ft. mills on the market at the present time.

The Waterous 7 ft. Band Mill fills these requirements in every particular.

It will take a saw up to 12-in. blade, will split a 36-in. log, has all the fast cutting features of the larger sized mills and yet represents a saving of several hundred dollars in initial expense, in up-keep in saws and in filing tool equipment.

Although containing all these fast-cutting features, we are able to build this, 7-foot mill cheaper than would be possible if we had not already done the expensive experimental work and tested these features out on our heavier mills. All you pay for is the cost of construction.

HOW—

The Waterous 7-foot Band Mill is built right and left hand for single or double cutting. **The frame** extends completely around the mill, is very wide and deep, carries on it all feed rolls, etc., to make the machine entirely self-contained. **Columns** are a combination of box and girder section, of graceful business-like design, have wide bearings on the frame and grip the mandrel supporting posts above and below the mandrel. The long recess in the columns permits an exceptionally long vertical adjustment of the upper wheel.

Both wheels are built on old designs that have proved themselves practically perfect in weight proportion and smooth running qualities. **Mandrel boxes** are adjustable in all directions, are extra long, babbitted with finest bearing babbit, and are chambered for water cooling.

Tension and tilting device and raising and lowering mechanism are those supplied on our heavier mills. They are completely enclosed within the columns where they are kept absolutely free of sawdust, slivers, etc. A large door in each column permits of ready overhauling. **The tension device** has been in use for several years and has proved itself second to none on the market. Every fulcrum point is double knife edged and weights are carried on self-cushioning springs which absorb sudden shocks and jars that might affect the saw. **The raising and lowering** is effected by means of a hand wheel and double threaded jack screw working in the bottom of upper mandrel supporting posts. Jack screws are connected to raise and lower upper mandrel in perfect line.

Both upper and lower guides swing exactly about the centre of saw blade, both are instantaneous opening, with wide space between jaws for quick removal of sawdust and slivers. **Upper guide** is particularly rigid, is provided with safety slide, has brass plug contact with saw blade and water lubrication. It is raised or lowered by a special **steam raising device** or by hand wheel and chain—both giving positive and rapid movement. Lower guide can be operated from front or rear of mill as desired. Live rolls are carried on the frame, a bevel ended worm roll as illustrated being supplied with double cutter, speed 400 feet per minute.

The bystanding cut made from the machine drawing itself, shows the graceful, clean-cut, business-like design of this mill. Every part is built to combine strength and rigidity, and the mill is put together by experts in this work. We **test every machine before it leaves the shop.**

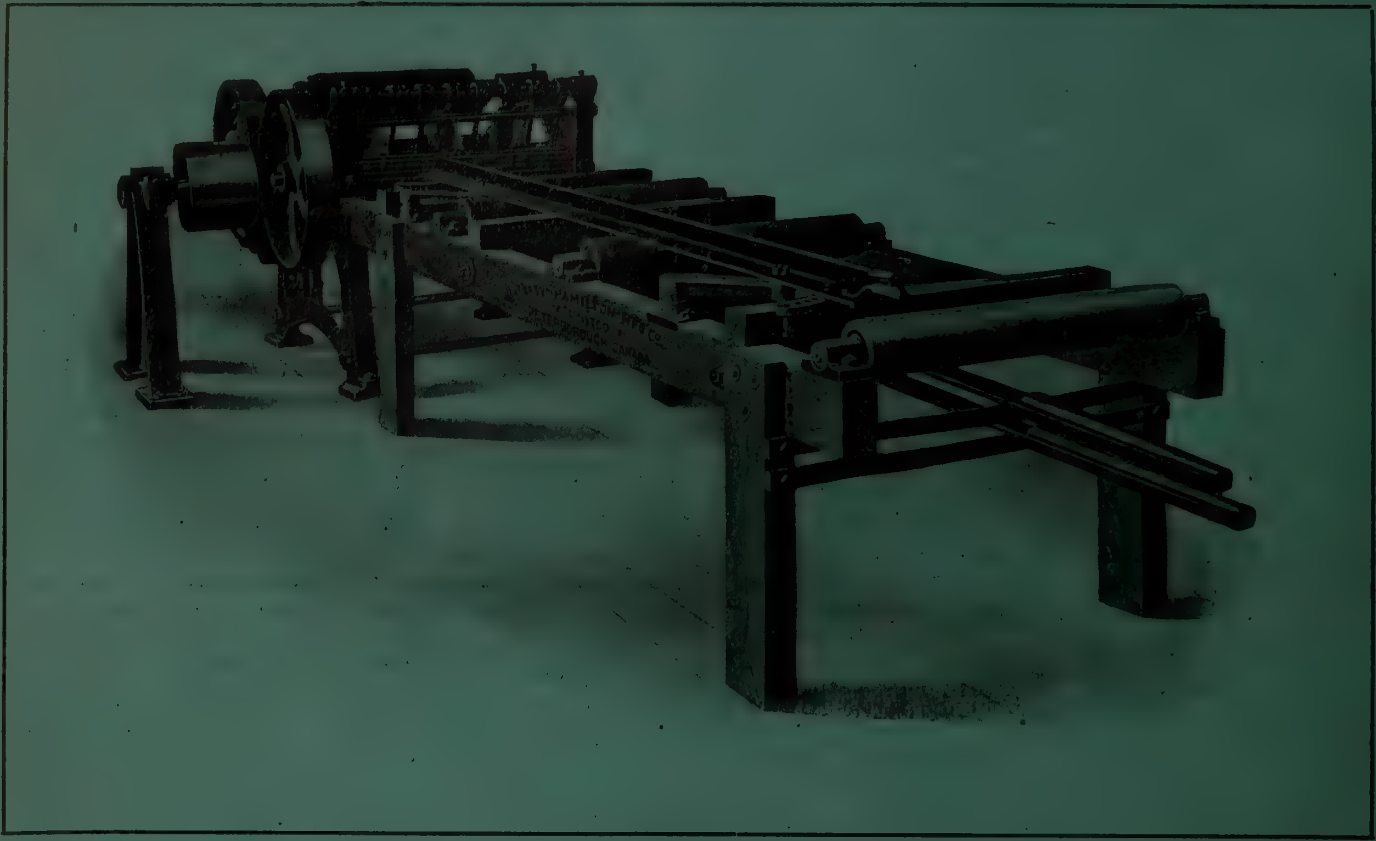
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

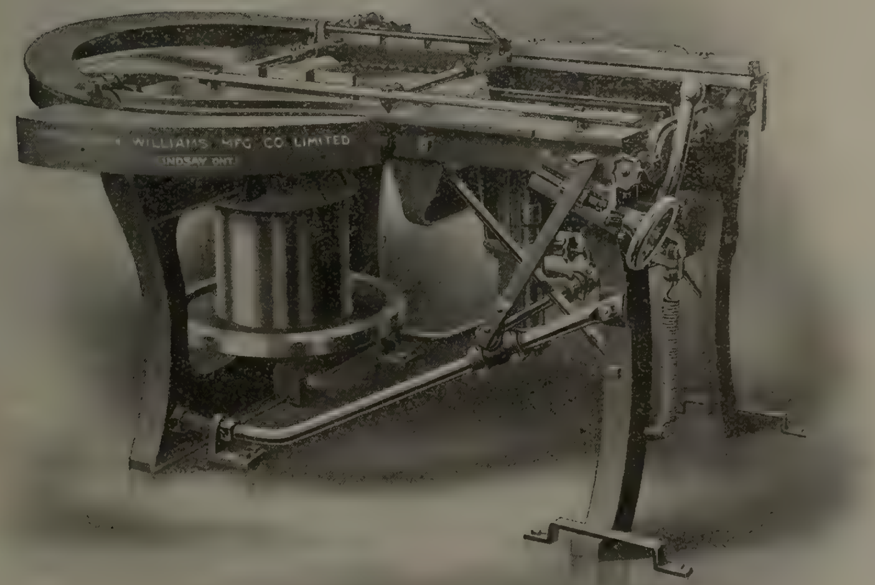
Write for Catalogue and Prices



Perkins' Shingle Machine

Hand Feed

THE FRAME of this Machine is Cast Iron heavily ribbed. All parts securely bolted together.

TO GIVE saw lead shift the screws in rear and front of arbor bridge pot box. No danger of heating box or disturbing alignment of frame in so doing.

TO TIGHTEN main drive belt turn the nuts on outside of L shaped standard fastened on to foundation skids. This draws the machine away from the line or counter shaft. Machine must be placed on and fastened to a level and solid foundation, one that is straight and out of wind.

BALANCE WHEEL PULLEY. Experience teaches that a pulley of this design enables the machine to be driven full capacity with a belt two inches narrower than where the balance wheel is omitted. It also maintains a more uniform motion, as the intermittent strain thrown on the arbor and driving belt in the act of sawing is overcome by the momentum of the mass of metal in the balance wheel. Pulley is turned inside and out, securing a perfect running balance. A Removable Cast Iron Cover keeps all refuse and sawdust out of the pulley.

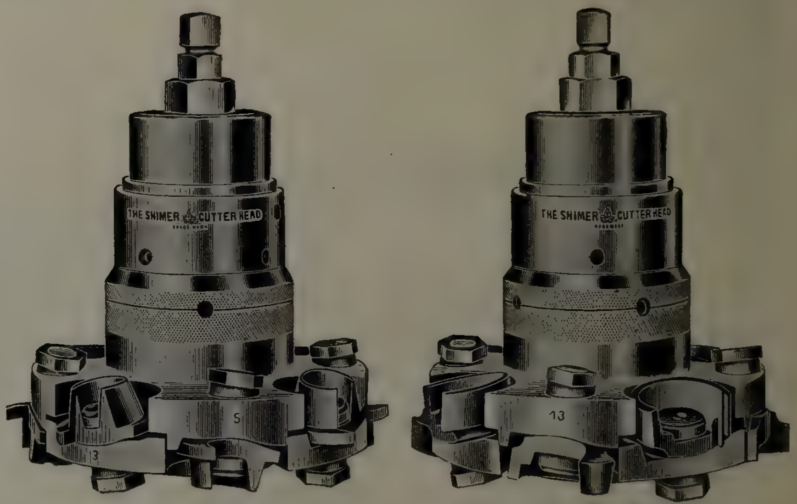
A Day's Run

—OF—

The Shimer Cutter Heads



on your matcher or moulder will convince you of their ability to produce neatly formed single tongue and groove flooring in sufficient quantity to make their use interesting. The cross-grain and the knot take better finish by reason of the alternate clearance cut, for making of which these tools embody special features.

The cutters work in pairs, dividing the cut into upper and lower series upon the head, operating alternately, thereby reducing the tendency to tear out the fibrous or knotty portions of the board. Their careful, systematic construction reduces the labor of keeping the heads and bits in perfect order, and in many mills they have been known to SAVE THEIR COST IN A DAY'S RUN.

May we show you by actual test what they can do for you? We send them to responsible lumbermen anywhere on trial.

SEE THAT YOU GET THE GENUINE. Look for the NAME and TRADE-MARK "THE SHIMER CUTTER HEAD" stamped on every Head we turn out. A dealer who would sell you an imitation means to deceive you—send them back and demand the genuine article with our guarantee for your protection.

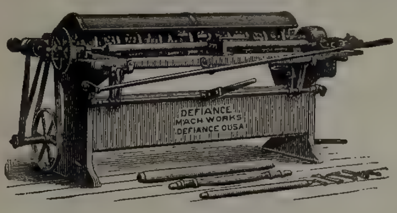
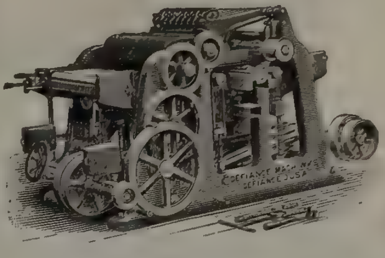
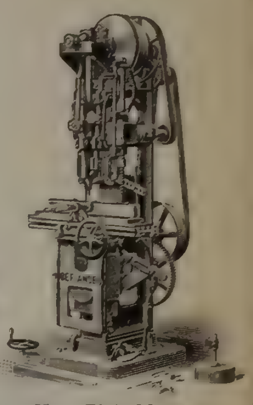
28" Band Saw



72" Handle Lathe



26" Double Surfacer



No. 6 Plain Mortiser

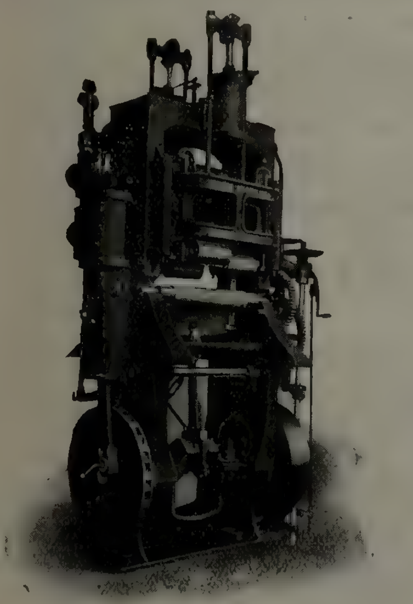
HAVE YOU

Crooked Logs?

Watch them on the carriage. See how much goes into slabs, how little into lumber.

Change the process. Slab them at right angles to the bend-thin uniform slabs. Throw them to the gang, flat side down, the bend horizontal. Guide them through the gang saws parallel to the grain and get all the boards there are in the log. The bent boards straighten out in the kiln and pile and are as good as any.

Thus a little brains, a little patience and a little waste timber are



COINED INTO MONEY.

MOWRY & SONS, - Gravenhurst, Ontario

How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits, Plug up the leaks—save time, money, *power*, by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for *saved energy*—**economy.** Built up of plies of rubberized fabric, cured and vulanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

GOODYEAR Rubber Belting

High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse-power transmitted is large and the demand for tensile strength is great.

Black Diamond Belting

Lighter in weight, lower in price than above, but same in *quality.* Great quantities sold to **Sawmill** trade. Hundreds of mill owners say it gives better service than any other belt ever used.

Red Cross Belting

The ideal belt for **Thresher. Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

Elevator Belts

We make a specialty of **Elevator Belts.** Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping, insures longest service.

IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember*

Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog to-night.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Vol. 31 Toronto, December 15, 1911 No. 24

Courtesy in Business

Scientific principles to-day govern the conduct of business to a greater extent than ever before. The lumber manufacturer aims to have a perfect organization, to know the cost in each department—woods operations, manufacturing, selling. The wholesale dealer knows, or should know, the amount to be charged against the purchasing end of his business, likewise his selling cost. If the expense in relation to volume of business becomes abnormal, investigation will be made to locate the cause. Perhaps an expert is called in. It is essentially the day of the efficiency engineer. The best organization, however, can be undermined by neglect of proper attention to what may be termed the simple details.

Lack of courtesy in correspondence, failure to appreciate the other man's viewpoint, incivility towards customers, will retard the growth of any business. How many law suits could have been avoided if the correspondence had been tempered with a little more consideration for the buyer's opinion until the facts were definitely ascertained ? The office man must necessarily rely on the report of the inspector, and inspectors are not infallible. With the best of intentions on the part of the management, shipments of lumber will be made which are not up to grade. If a disposition is shown to have a complaint investigated, the customer at once feels that he is dealing with a responsible party.

Courteous treatment of salesmen should be the policy of all institutions. The mill owner must at times buy machinery and supplies, the wholesaler and retailer must buy lumber. The buyer cannot have too much information about supplies and prices, and from the nature of his avocation the salesman is in a position to advise him regarding trade conditions and to keep him in touch with things in general. But apart from this consideration, the salesman is entitled to a hearing. To him should be extended the same treatment you would like your travellers to receive.

A traveller recently related his grievance against a wholesale firm. Entering their office and explaining his business, the acting head of the concern appeared, but his lack of courtesy and general manner were such that the traveller was glad when he had passed along to a more pleasant atmosphere in another office. "No time to listen to your proposition," was the extent of the consideration he received, and this in a manner calculated to attract the attention of the entire staff to what was perhaps thought to be an object lesson in business, but which was in reality a display of incapable management and immature judgment.

To be courteous does not require more time; it is a habit which should be cultivated.

Interpretation of Lumber Duty

The duty on United States lumber was the subject of a lively discussion in the Dominion Parliament a fortnight ago, and interesting developments may be expected. Honorable Dr. Reid, the present Minister of Customs, has placed an interpretation on the tariff law in respect to lumber different from that of the late Laurier Government, the result of which is that lumber planed one side and one end will hereafter help to swell the Dominion Exchequer.

W. E. Knowles, member for Moose Jaw, Sask., strongly protested against the imposition of a duty on lumber which previously was admitted free. He claimed that a combine existed among the lumber manufacturers and that the government had been influenced to make the change in the interpretation of the tariff law with the object of removing competition. He regarded it as a hardship to the farmers and homesteaders of the prairies.

Honorable Dr. Reid pointed out that the law had not been changed. The Laurier Government had admitted free of duty large quantities of lumber which under the Customs Act was dutiable, and he proposed that this should not continue. He had referred the matter to the Customs Board and upon the report of that Board had issued his instructions. It was a question of enforcing the law.

The Mountain Lumber Manufacturers' Association have come into the controversy with a denial of the statement that a combine exists in Western Canada. Mr. W. A. Anstie, the secretary, sent the following telegram to the member for Kootenay in the Dominion House:—

> A. S. Goodeve, M.P., Ottawa, Canada,—
>
> Western press dispatches state that the member for Moose Jaw charges in the House that a lumber combine exists in British Columbia, and that the manufacturers have closed down their mills for the purpose of advancing prices.
>
> Mountain manufacturers emphatically deny existence of combine or anything approaching one, and strongly object to such unwarranted allegations unsupported by evidence or proof. We would welcome full investigation by an independent commission, which would establish beyond question the absolute freedom of competition in the wholesale market for British Columbia lumber as well as the fact that the wholesale price is too low to return to the manufacturer adequate profits on his product.
>
> Mountain mills have been closed down and logging operations largely suspended because of the impossibility of British Columbia manufacturers meeting the slaughter prices of American manufacturers whose demoralized home market, caused by over-production, has induced their dumping lumber into Canada at prices below the cost of production.
>
> Nearly four thousand men are out of work in the interior of British Columbia owing to reduced logging operations, and the loss of trade is being daily lamented by grain dealers, cattle dealers and farmers of Alberta. The British Columbia lumber industry furnishes a most important section of the market for the produce of Alberta, and for the purpose of a political argument it is unfair to ignore the strong inter-provincial interest.
>
> American shippers have evaded Canadian customs regulations in the past and British Columbia manufacturers want a square deal in the future.
>
> W. A. ANSTIE.

The present government is to be commended for its action in affording Canadian lumber manufacturers the protection to which they are apparently entitled by the law. The privilege of shipping lumber planed on one side from the United States to Canada without duty is a big handicap to the Canadian trade, but when this is further emphasized by foreign shippers roughing the edge of the lumber which has been further manufactured by being planed on one side and one edge, in order to avoid the Canadian duty of 25 per cent., it would appear as a deliberate attempt to evade the law. During the year now drawing to a close the importations of United States lumber into Canada, and particularly into the Western Provinces, have been enormous, and the Canadian Government can find no justification whatever in assisting the disposition of the manufacturers on the other side to use the Canadian market as a dumping ground. Let us hope, therefore, that the investigation will result in affording immediately a little more protection to Canadian manufacturers than they have had in the past, and that eventually the lumber schedule will be revised in such a way as to remove the existing one-sided arrangement.

Industrial Relations in Canada

The bringing home of guilt to the MacNamara brothers cannot fail to have a well defined influence on both labor and capital throughout the whole American continent. Its most direct bearing, perhaps, will be felt in the United States, but in Canada also, if no farther afield, a very real impression has been made. The manner in which the labor unions espoused the cause of the accused men aroused a not inconsiderable amount of class hatred in the United States and induced a certain amount of unsettled feeling in this country.

Undoubtedly there were many working men who believed that the MacNamaras were innocent of the anarchistic crime of which they were accused and that they were the victims of a conspiracy on the part of capital to injure the reputation of labor unions. No more harmful fallacy than this could be entertained; no more mistaken idea could be conceived than that there was an organized plot on the part of capital to appress the laboring man.

The confession made by the accused men brings home this truth to labor organizations throughout the continent as no possible evidence in a court of law could do, and it may reasonably be hoped that these organizations will be aroused to purge themselves thoroughly of all identification with criminal measures of improving their ends. The revelations of this labor-union conspiracy will force the clean associations to a higher plane and effectually exterminate the remainder.

The law-abiding, constructive labor union is an institution that may be regarded as necessary to public safety, but the destructive, reckless society that produces such men as the MacNamaras is a menace that should and must be crushed like a viper. Such bitter enmity of those who work with their hands against organized society, and against all the institutions beneficial to the public at large which that society has created, is fraught with a danger greater than the civil war.

Generally speaking, both employer and employee in every phase of industry desire peace, and no words of condemnation can be too severe for such a crime as was brought home at Los Angeles. The history of industrial relations in Canada is happily free from any record of oppression on the part of capital, but there is a very real lesson for us in the drama that has been enacted in the United States. In the natural order of things there will come a time, perhaps, when Canada will be even numerically equal to the neighboring republic and long before this we may have to cope with far more complicated conditions than the present. Looking to that day, Canada's hope is to see that the basic principles upon which her industrial relations are laid down are on a just and equitable footing.

In the United States there has been afforded the spectacle of the collapse of a great structure owing to the weakness of its foundations. The spectacle is a deplorable one, but nevertheless Canada can profit thereby.

Export Rates and Car Shortage

At the annual meeting of the Montreal Lumber Section of the Board of Trade, held recently, Mr. W. K. Grafftey referred to several transportation matters which had been dealt with during the year, and stated that the association had been successful in obtaining export rates by the Canadian Pacific Railway for points on the Laurentian branch. The Railway Commissioners, by three to two, had been against the shippers in the dispute as to whether the shipper or the railroad should bear the cost of supplying stakes and fastenings for flat cars. The matter of allowances for track scale weights had also been considered, but the question had been adjourned with a view to arriving at an understanding with the railway companies; at the same time the question of placing weight certificates on advice notes, which the Association is demanding, will, it is hoped, be conceded. The car shortage question had also been taken up, and the companies urged to give a better supply so as to enable contracts to be filled on summer rates, or these rates extended.

Christmas
Greeting
with Peace &
Plenty for ✠
the New Year

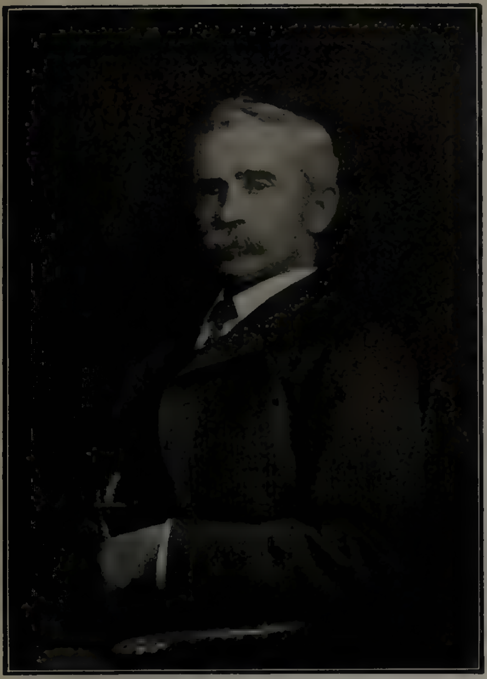
The most important matter before the association during the year was the defection of the wholesale trade and the manufacturers in the matter of sales direct to the retail trade and to contractors. In the past many manufacturers have sold to retailers and contractors at the same price as to wholesalers, while it was the practice of many wholesalers to sell to contractors and consumers at the same price as they sold to the retail trade. The manufacturers are being urged to co-operate with the association in protecting the wholesale trade. With the assistance of the Retail Association a better and more definite understanding on the question may shortly be arrived at.

The following officers for 1912 have been elected: President, W. K. Graffety; vice-president, G. W. Grier; treasurer, F. W. Cotter; directors, A. H. Campbell, J. H. Redfern, D. H. McLennan, T. J. Rutherford. Mr. Graffety was unanimously nominated for re-election as the association's representative on the Council of the Board of Trade.

Mr. Stevens, M.P., has introduced in parliament a bill amending the criminal code by providing penalties for the theft of logs floating in harbors or coastal waters. The present law only covers thefts of logs in inland waters.

The Trend of Lumber Trade Prices

Competition Between Spruce and Pine—Future of the Industry—Lumber Values Sure to Increase



Mr. W. K. Grafftey

"Lumber, past, present and future" was the subject of an address by Mr. W. K. Grafftey, managing director of the Montreal Lumber Company, Limited, and the president of the Montreal Lumber Association, before the members of the Builders' Exchange at their noonday lunch on November 29th. In the course of his speech Mr. Grafftey said:

"We are living to-day in a time of iron and steel more than a period of lumber, but at the same time lumber was a large factor in the building trade; it was not used in the same capacity as it was formerly, but it still held a strong position in commercial commodities. Mr. Grafftey recalled and paid tribute to the names of men who in the past had built up the Montreal building trade, mentioning Geo. Roberts, William Rutherford, A. McIntyre, R. Weir and Laird Paton. Comparing values of many years ago with those of to-day, he stated that what would bring twenty-five dollars per thousand feet then was now valued at seventy-five dollars. Thousands of dollars were absolutely lost by the bad manufacture of lumber, and man's incompetence often added to the loss.

As a city Montreal was going through rapid changes, and it was difficult to get reliable figures as to what lumber was used, but he estimated that in the city 140,000,000 to 160,000,000 feet of common lumber were annually used, the value being from 4 to 5 million dollars; finishing lumber of the same value was also consumed, so that one could see the importance of this industry to the city.

"We are using our natural resources at a rapid rate, and those who lived for 25 years would find it more difficult to obtain what they wanted than was the case to-day. He asked them to as far as possible conserve these valuable resources of the country. Most of this wealth was held in the hands of a very few men."

During the last few years there had been a sharp conflict between the use of spruce and pine. Twenty years ago spruce was not allowed to go into a building in Montreal, yet to-day it was the leading timber. Before very long, however, he believed that pine would go back to the place it held 25 years ago. He did not desire to run down spruce, but in his opinion it was a treacherous wood to place in the roof of a building. Mr. Grafftey was of opinion that not only should the plans of buildings be inspected, but the quality of materials which went into buildings should be inspected by competent men, and he considered it abominable that certain material was allowed to be used in the roofs of buildings.

The speaker referred to disputes which arose as to the quantity of material delivered, and said it was difficult to arrive at a harmonious understanding between buyers and distributors of material. This he was convinced arose from want of knowledge, and he instanced a contractor who had purchased a given quantity of pine and who believed that, after the job had been finished, he had not received what he had bargained for. The contractor had not taken account of the fact that the pine had to be planed, and that in the process of manufacture some amount had been lost. Then, too, an immense amount of trouble would be saved if architects, builders, and proprietors would really understand what certain terms in contracts meant. As president of the Lumber Association, he was often called on to adjust disputes about the quality of floors, and in one instance, where architect, builder, and proprietor could not agree, it was stipulated in the contract that the floor should be No. One. The proprietor was of opinion that this meant a floor of first class lumber—a very different thing from a No. 1 floor. On its being explained, the proprietor saw that he was asking for something which was not in the contract.

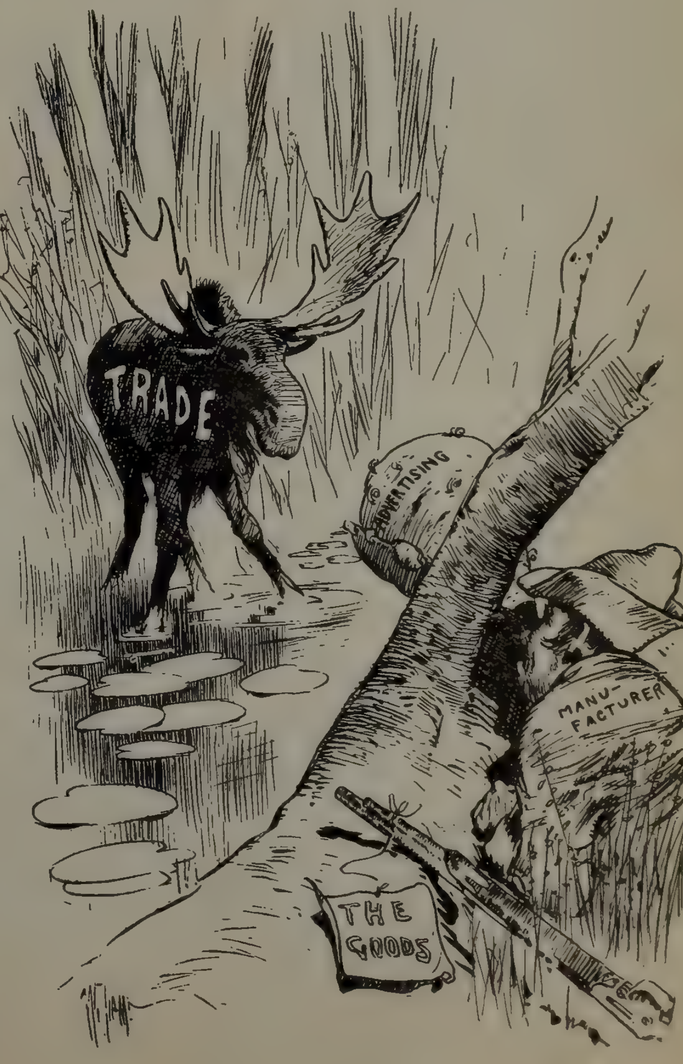
When in Toronto he saw notices in lumber offices to the effect that builders should see that proper entrances to the building were made. The explanation was that lumber merchants required their carters to obtain tickets on the delivery of lumber, but at times the builders desired that every piece should be measured and counted before they would sign the ticket—a very unreasonable thing to ask to delay carters.

Dealing with the future of the industry, the speaker said that as years went on the value of lumber was bound to increase. Some years ago it was thought that Russian pine would oust Canadian pine. Much of the Russian pine was imported into England, and he was speaking to a gentleman from Belfast interested in the shipbuilding trade, who said that although Russian pine was similar in appearance and texture to Canadian lumber, it was not so suitable for shipbuilding. There was nothing that could take the place of the Canadian white pine. It was necessary that we should conserve what we have left. The Forestry Association was doing good work, and were trying to establish telephone communication over great areas so that in case of fire they could obtain speedy help. As his hearers were no doubt aware, there was as much lumber destroyed by fire as was used for commercial purposes. The Legislature of Quebec had under consideration the making of a grant for telephones next year.

On the question of trade associations, Mr. Grafftey referred to the formation of bodies for different branches of trade. While he was strongly in favor of men getting together for the exchange of ideas, he deprecated 25 or 30 men meeting together and endeavoring to regulate the methods in which trade should be done. A great deal of irritation might be caused by men trying to regulate the whole trade. The members of the Montreal Lumber Association discussed various matters of interest to their business, but they did not feel they had the right to dictate what those in the Montreal lumber trade should do; they objected to a few men demanding that those in an association should not sell to anyone outside that body. An association of 25 men could not control the action of the whole trade. Mr. Grafftey concluded by saying he did not wish to be misunderstood—he was in favor of associations being formed, but he objected to members of the trade being dictated to.

On the motion of Mr. W. Rutherford, of William Rutherford & Son Company, Limited, a vote of thanks was passed to Mr. Grafftey.

The Duke of Connaught, accompanied by the Duchess of Connaught, paid a visit to the factories of the E. B. Eddy Company, Hull, recently and spent two hours inspecting the machinery and various processes of converting logs into paper.



The Call of 1912.

Causes Underlying Business Failures

Lack of Sufficienf Capital Always a Factor—Tact and Diplomacy Essential Characteristics —Few Failures, However, in Proportion to the Varied Interests Involved in the Business

It has often been proven in the lives of many of our best business men that they tried a number of occupations before they found the one for which they were best fitted. There are a good many, however, probably the larger majority, who are still working in lines of business and other occupations that have never found out they were best adapted for something else other than what they are doing. There are those, also, who feel they are not following their natural bent and inclinations, but circumstances have proven too strong for them, and they are doing what they can and making the best of it. There are but few men who make a special study of themselves with the view of engaging in the business that by temperament and capability they are really the best fitted for. The great majority of men are led into a business by circumstances and conditions that have had much to do in coloring their prospects for success; and not until they have been tested by the touchstone of experience do they learn their own weaknesses or strength in it. The rule of "cut and try" is one that is generally followed, and this has led to such aggregate results as to warrant the statement that nearly ninety per cent. of men who go into business for themselves meet with failure. It has often been remarked by those in the undeveloped stage that one kind of business is as good an another, so long as there is money to be made in it. This expression voices an idea which, to a certain extent, is typical of the progression that has made this country what it is, and what it continues to be.

The Moral of Business Failures

A great deal has been said and written on the subject of business failures, their causes, and suggestions for their prevention. The philosophy of them, however, is rarely thought of and sought for, but the real and underlying cause for the larger part of them is a lack of adaptability of temperament, and a special fitness and training together with a fundamental weakness of character. One of the material causes is often the lack of sufficient capital, but the possession of the essential qualifications, united with strength of character, will counterbalance any insufficiency of capital that a man may have to start with.

I have often thought of the many incongruous elements I have seen in the make-up of the different men I have known engaged in the retail lumber business. If the question was asked them why they went into the lumber business, the almost invariable answer would be, because they thought it a good money making business; and for this reason I have known some queer combinations in partnerships. A preacher and a druggist; a blacksmith and a farmer; a school teacher and an auctioneer, and so on, all through the list of occupations. Men would quit what they were doing, and with a few hundred dollars, go into business they knew practically nothing about. Of course, some of these combinations proved successful, because in those days it did not require either much capital or knowledge of lumber to open up and run a retail yard. Most everybody was buying lumber then, and the number of grades could be counted on one hand.

There has got to be, as a matter of course, commencement in the life of anyone to any line of business he may choose to enter, but few, as a rule, care to begin at the bottom to learn it; and this was largely the reason why for many years there were so many misfits in the lumber business. Those who stayed in it and attained the business sense and training they should have had at first going in, have learned something more of how to get business other than the cutting of prices and making war generally on their competitors.

Few Failures in the Lumber Business in Proportion to the Interests Involved

The statistics of the lumber business, I think, will show fewer failures in proportion to the interests involved that in any other, but this, I believe, is not owing to superior ability in conducting it, but from the very nature of the business itself; the protection offered by the lien laws, and the fact of its always being a staple and salable commodity, there being no remnants or shelf worn goods to auction off as in many other lines of business. These features of the business will always be a favoring characteristic and will undergo but little change in this respect.

But, in the future conducting of the retail part of it, there must of necessity be a change in the training and fitness of the men directly operating the yards, and this is due to the general change that has been in progress in the entire business world everywhere. Something besides the simple quality of being a "good fellow," or a "cheap boy" will be necessary to the successful running of a retail yard. If a man can't get business only by the cheap method of cutting prices, he won't hold his job long. It requires no skill or shrewdness of mind to get a bill from a competitor by the simple act of writing down a few figures that are below the total as offered by him; but it does require a personality and ability to get more for a bill than it has been offered for. This latter class of men are not to be picked up every day. What the great business concerns are always on the lookout for are those who are not only natural salesmen, but men who know the science of salesmanship. First-class salesmen are more in demand to-day than managers and, therefore, command bigger salaries. This is what is needed in the retail lumber business but unfortunately for it, it is too often the case that salesman and manager is combined in one, and a perfect combination like this is hard to find in a lumber yard, because such ability is in demand elsewhere and paid for accordingly. Line yard concerns think they can't afford to pay these prices, but there is where they make the error; and so they go on hiring managers and expect them not only to manage the yard, but be good salesmen as well. As a rule, however, they get just about what they are paying for, and but little beyond that. There is no denying the fact that outside competition in the lumber business is becoming stronger instead of weaker. And it is this contending feature that calls for a better quality of salesmanship in the local manager of a yard.

Must Depend Largely on Character and Ability

It is all well enough to consider and talk about associations and protection and all this sort of thing. These are well enough as far as they go, but the fact remains, however, that these contending, and strongly competitive conditions spoken of are something that are beyond our control, and it is up to the trade to adjust itself to meet and deal with them. And success or failure must, therefore, depend largely on the character, ability, and the essential training and fitness of the dealer himself. To one possessed of these qualities trade protection is a secondary matter with him.

Ready-made lumbermen will soon be among the relics of past methods in the retail business. The "pick-ups" in the trade will stand no show if they have only their own merits to depend on, and the best of backing will tire of them. Results are what the putters-up of cash are looking for, and close margins will not allow much to pay for the training and schooling of salesmen. If I were compelled to choose between a man of tact and a man of talent to run a yard for me, I believe I would take the former, although a combination of these two qualities would be preferable; but this is pretty rare to find in any great measure in any one individual. When you do find tact and talent strongly developed in one business man, he is among the kings of trade.

There is hardly any retail business that does not require more or less degree of tact in dealing with customers of the average intelligence, and it is this qualification, more than any other perhaps, that distinguishes the successful salesman. Of course, tact is a natural gift—everybody possesses it in some degree, but what we know as business tact is both natural and acquired, and comes largely from experience and observation, and when added to a temperament capable of quick adjustment to the moods, whims and caprices of other people, forms a combination that goes far to compensate for deficiencies of education in the more technical knowledge of the business. A man can be a first-class accountant and wholly capable in everything pertaining to the science of accounts, and still be a very poor hand to sell goods. I once knew a railroad rate expert who conceived the idea that he could engage in the grain business in a good country town and make a good deal more than the salary the railroad was paying him. He tried it for about three years, till he went "broke," and then he went back to the old business he was adapted and trained for, and he is now one of the recognized authorities on the intricacies of railroad rates.

Every Man Has His "Blind Side"

Every man has his "blind side," be he learned or ignorant, and I have sometimes had the notion that men of education had more "blind" angles than those of a more humble degree of knowledge. It is, however, more pronounced and easier to be seen in those who are pig-headed and obstinate. The tactful man is always looking for this side of every one with whom he has business dealings, or other intercourse, and he throws the "lariat" of persuasion over their heads and leads them where he wills. The tactful man is also full of resources. If he is selling lumber in the alleys of a yard and a customer comes for something he hasn't got in stock, he will sell him something else, and in the sale both are satisfied. The tactful salesman never rows against the current of opposing opinion, but he goes with it, and still keeps his own all the same. His smile of assent may be stereotyped, but the contrary minded customer never sees below the surface, as is the case with all obstinate and opinionated people.

The man of tact learns to deal with men in the concrete, rather than in the abstract; not as they ought to be, but as he finds them. As a salesman of lumber, his level is changeable, varying to suit the farmer, the professional and the business man. He pays as much attention to the old lady who wants a nickel's worth of lime for whitewash as though she was his prospective mother-in-law. He listens patiently and with absorbed interest to her recitation on her luck in poultry raising, which usually includes a reference to lousy chickens. He suggests the use of slack lime in such a deferential way that she gets a bushel of it and returns home and talks about the nice, pleasant fellow at the lumber yard, and how interested he was in the welfare of the farmers, and so obliging in his ways. She is sure that he has had a good bringing up at home, and so by a little tact in humoring this garulous old girl, a profitable trade may have been secured from this one farm.

Talent Versus Tact

Talent in trade is like a bird with clipped wings—its aspiration is to rise, but the propelling force is wanting, and its success in a business way is in direct proportion to the amount of tact allied with it in action. Talent alone is always wanting, but being stationary, never gets it. Tact goes for what it wants and secures it. Talent has a conscience, so has Tact, but he doesn't use it all the time. If a man prefers, and insists on taking "streaky clear" because it is free from knots, he lets him have it and leaves him to find out the difference for himself. Talent is a good buyer, but Tact is the best seller. Talent is careful about making mistakes, and when he does, it worries him. Tact makes them too, but is careful not to let anyone else know of it. He would rather be a loser, than to have his customer lose confidence in his accuracy. In either case, he knows he is the loser, so he keeps all such things to himself. Talent buys the stocks and figures out the bills, but Tact sells them and makes the money out of them. And this practically the principal relation which the manager of a line yard holds to the concern that employs him. He is not supposed to have control over the policy of the yard, nor buy the stock, or know what it costs—his business is to sell the stock at a profit and get the money. But, as before said, this is getting to be more of a different proposition every year, and hence, the necessity for a class of men to run yards who have more of the essential qualities of a salesman than those of the directing faculty. A certain amount of the latter is of course required, but the predominant ability needed most to-day in a line yard agent is that he possess the tact and resourcefulness to sell goods at a profit, and the tactful ability to collect his accounts with a minimum loss.

This is the class of men that capital is looking for most in the commercial world to-day, and the field is unlimited for the young man who possesses the tactful temperament and the will and patience to climb the ladder of a practical training.—By "An Old Retailer" in the St. Louis Lumberman.

Canada's Water Powers

The first inventory taken of the water powers of Canada has been just completed by the Conservation Commission, after two years' investigation. The report shows a total of 1,016,521 horse power developed from water power in Canada. The commission says: "General statements, implying that the aggregate amount of water power must be great because the total water area or water shed area is great, or because there are so many lakes and rivers, are generalities to be considered of very little definite value. One of the chief dangers of such generalities is to create in the popular mind a feeling of unwarranted assurance that even though desirable water rights are being granted by the government, yet there is so much left that no apprehension may be entertained regarding the amount of power rights being parted with."

The report states that the low water flow of the Niagara River would yield at the falls about 2,500,000 horse power, of which Canada has one-half. Franchises have been already granted and plans completed for development on the Canadian side of the river for about 450,000 horse power. "Instead of millions of horse-power being available, as has been sometimes stated," says the report, "it appears that about half of Canada's usable share of Niagara power has already been placed under private control."

In respect to the Chaudiere Falls, which drive the pulp and paper mills of the E. B. Eddy Company and J. R. Booth, the minimum is placed at 95,000 horse power. There is no remark made as to the electric energy used at the Chaudiere. The great Chats Falls, 40 miles up the Ottawa River from the Capital, is given a minimum of 150,000 horse power. The Long Sault, on the Ottawa, is given a possible development of 25,000 horse power, and with regulated water and canalized river 94,000. Dechenes and Britannia rapids are estimated at 14,000 horse power.

Canada is given an estimated water area of 125,735 square miles, as compared with 52,630 square miles in the United States. Ontario's portion is 40,354 square miles, exclusive of the Great Lakes.

An "Embarrassing Delay"

The Paper Trade Journal is waiting anxiously the result of the several conferences at Washington to learn whether or not the United States is to have free trade in pulp and paper, in its truest sense, or a modified form of it with Canada only. Commenting editorially, the Journal says:

"The Administration has made a sad mess of things, and has placed this country in the position of having its good faith seriously questioned. It is quite patent to every thinking mind that the delay in settling the question has not arisen because of any doubt as to what ought to be done, but because, no matter what is done, sharp criticism, if not something worse, will be visited upon the governmental authorities, and this, too, at a most inopportune time. And so, as it were, hemmed in between the devil and the deep sea, they hesitate to step one way or the other. No matter what the consequences of the original blunder may lead to, however, they cannot sit forever on the fence and it is difficult to see what can possibly be accomplished by putting off the evil hour other than to cause great annoyance and disturbance to business. The holding up of a mere section of the mercantile community, however, has apparently, from force of habit, become a matter of little consideration at Washington.

"The perplexities in this case have grown so great, and a definite conclusion is fraught with such serious consequences, that the Administration is casting about to find some possible way of shifting the responsibility, and the courts, which have often proved a source of ready help in trouble, may be found convenient in this case. They are not beholden to anybody for what they do, and, free from political and diplomatic contingencies, they frequently afford a desirable wind shield for the Ship of State and prevent it from driving on the rocks.

"As a matter of fact, however, this is not a question for the courts to decide, and a reference to them will create the impression that the United States is trying to shelve its responsibility. It will put the country in an unfair light before the nations of the world. What ought to be done, and what no doubt the Administration would be delighted now to do, would be to abrogate Section 2 of the "reciprocity act." This, of course, can only be done by Congress, but if the President and his advisers have the same influence now as they had at the special session it could be accomplished in due course."

Personal

Mr. Arthur Rushforth, of Liverpool, who has frequently visited Canada in the interests of the veneer industry, is again in this country.

Mr. W. J. Wories, managing director of Loeber, Limited, wholesale and export paper merchants and manufacturers, Amsterdam, Holland, was in Toronto recently, on business.

The Hon. G. H. Perley, M.P. for Argenteuil, the Ottawa lumberman, was entertained at dinner at Lachute, P.Q., on Nov. 1, by his constituents. The banquet was in honor of the admission of Mr. Perley into the Conservative Government as minister without portfolio.

Mr. S. A. Sabbatton has been elected a director of the Laurentide Company in place of the late Charles F. Smith. Mr. Sabbatton is the assistant manager of the company. The company declared a quarterly divident at the rate of 8 per cent. per annum, or at the rate of 16 per cent. on the old stock.

Mr. John Hendry, of Vancouver, B.C., president of the British Columbia Mills and Timber Company, has been on a visit to Montreal. In an interview on general conditions in the West Mr. Hendry stated that while the home market for lumber had been good, the export trade had not been of the best. Things, however, were looking up and he expected a revival during next year.

Consequent on the resignation of Mr. J. H. Poulin as secretary of the Eagle Lumber Company, Montreal, there has been a reorganization in the office arrangements. Mr. A. P. Beaupre, the general manager, who was in charge of the Mont Laurier mill, is now in Montreal in charge of the sales and purchasing departments, and will be succeeded at the mills by Mr. G. Villeneuve. Mr. T. E. Dufresne has been appointed secretary of the company.

The Band Saw

First Article of Series Specially Written for the Canada Lumberman by Hapsburg Leibe.

Introduction

It is only fair to say at the outset that my intention is not to attempt to make a capable filer of a novice by telling in an article how saws should be fitted. Instead, my express purpose is to set forth ideas and to give information that will help the man who is finding it hard to hold his position and give satisfactory results in return for the sound money he receives for his services. I shall be only glad if the older heads find anything that will be regarded as worthy of addition to their already goodly stock of bandsaw knowledge. At least, perhaps, they may discover a measure of interest in a comparison of methods.

For my authority to these dissertations to follow, I may say that I have myself fitted bands for a decade of years with marked success; I will add also that I worked up from the ground, and through my own efforts. My experience has been on saws from four to fourteen inches in width, the latter named, of course, in very fast mills.

In General

The growing scarcity of timber and the corresponding high value of lumber have driven the mill owner to the point where he not only asks, but demands, the minimum of spread in order to keep as much as possible of his timber from the sawdust pile, the fewest possible of miscut boards, and the maximum daily output in thousands of feet. To this end, great skill is required in the fitting of the saws—and in the actual work of sawing as well; but this article has little to do except with the filing room. Naturally, the man who can satisfy is the man who is going to hold his position longest; and, as naturally, the man with the skill is the man who is able to satisfy. It is a phase of the world-old case of the survival of the fittest.

How may one attain skill as a filer? There are no schools devoted to teaching the art—for it surely is an art; there are not even, so far as my observation has reached, correspondence schools that treat on the subject. So it is a trade isolated, standing alone, apart. To possess the skill necessary before one may call himself truly a capable filer, one must employ every stray bit of information that weighs well, which means that he should leave the chaff and save only the grain. And, brother, take it from one who picked up here and there or worked out for himself every particle of the knowledge that led to his success, the keynote that leads to the pinnacle is simply good, hard, conscientious, judicious work. That is the trade secret that you, mediocre filer, have longed for in order that you might vie with the fellow whose hours are worth a dollar each—work. And work, in this connection, means not only sweat and grime; it means energy in a mental capacity, an ability to catch things, to read with understanding what others have written, to listen to and remember what others are saying on the question of saw fitting, to watch the other fellow—who has mastered the tools with which you are cutting your fingers. And must depends on good judgment.

Judgment

Although this quality was named in the preceding paragraph, it will bear a little of elaboration. Judgment of cause and effect, let us put it, if you will. There are many, many factors to cause a band to lead, or to dodge at the end, or to dodge in the middle of the cut, or to have a tendency to evade knots or tough places at any point. When the latter occurs, judgment tells one that the saw is generally weak; when the saw noses out of the log on entering, judgment tells us that it is weak on one side. But judgment must be accelerated by knowledge when it becomes a question of why these things happen. Acquaintance with superficial conditions helps; but it is not all the equipment necessary.

Now, is one of the above named undesirable conditions, if it were to happen with you, the fault of one of the many factors that may cause it, or is it the fault of a conglomeration of those factors? Depends, of course. However, add knowledge to judgment, and the ability to work hard, and the trouble must be righted. Others have learned how; others may still learn how.

Concerning Tools

Not every young filer knows how to choose and later care for the two tools of which I shall have to say in the following three paragraphs. All tools, of course, come in for their share of importance; but the hammer and straightedge are most in use and therefore the most in importance.

There are many filers still hanging to the old cross face as a general panacea for all the ills of the blade as it lies on the bench under the straightedge; and of this I have no criticism to make. However, it has always been a belief of mine that I could do as much hammering and as good hammering with the straight-with-the-handle face as I could do with both; and because of that my favorite hammer for levelling is one that has one long pene, which runs parallel with the handle, and a round face on the other end. While it has never been a part of my methods to hammer for tension, even for the purpose of stretching a very small spot, I have often found small, round lumps that acted better in adjustment with the round than with the long face. And any hammer should be neither too heavy nor too light for the thickness of the saw on which it is to be used. If too light, the work of levelling will be too slow; if too heavy, the lumps and ridges will fall too quickly, and often go to the other side of the blade. Another bad feature of the unduly heavy hammer is that it may mark the saw.

So, too, will a hammer face that is too sharp mark the saw. While it is a job that requires being done to a nicety, the average man, if he uses patience and care, may grind his own hammer faces. Put a little oil on the freshly ground pene, and then strike the levelling block gently and squarely; this will show up on the block the shape of the face. It should resemble a long oval. As the emery wheel is prone to leave a rough surface, which will transfer its likeness to the saw with each blow, it is well to scour the hammer face smooth with a fine grade of emery cloth.

One should keep a perfect straightedge as a test gauge; and this should be kept sacred as a heathen's idol and used only for the purpose of truing up the straightedges in actual use. These are usually thin, and much dragging over the saw, on which there is always a percentage of grit, wears them out of line almost before one is aware of it. It is also well, but perhaps hardly so important, to keep test templates of the different circles of tension gauges used on the various widths of saw.

Light at the Bench

This is a thing that governs the degree of sawfitting more than many will be willing to believe at first blush. It is one of the finer points—but the man who studies the finer points is going to be the man who survives. If the light is brighter at one end of the levelling block than at the other, does it not stand to reason that the eye will see the lumps, and therefore the hammer hammer the lumps, differently? Or, if the light is brighter on one side than on the other, even, is not the same effect apparent? Especially will this latter have a marked bearing on the fitting of a two-edged saw. The hammering bench should be, by all means, facing the north or the south; if it is not, and if it cannot be conveniently changed, shades should be put up at the windows and so used to throw an even, neither too bright nor too dim, light upon the saw.

A light that is too bright will exaggerate the condition of the plate, and, nine chances out of ten, will mislead the filer into hammering his saw through. A thousandth of an inch, facing a bright light, will appear many times multiplied, which illusion, no doubt, is due more or less to the polished edge of the gauge and the surface of the saw. A light that is too dim will not show up, it is evident, the true condition of the plate, and is therefore also detrimental to good work. If, however, there is no immediate remedy for these undesirable conditions, the use of a thick straightedge will help to alleviate the former, while the use of a thin straightedge will work to the opposite.

Another place, while on this subject, that light has a bearing worthy of note, is the toothing clamp. If it does not come down equally, the finished points may be fitted a little to one side, which may be sufficient, especially if there are other things having the same overbalancing effect, to cause the blade to lead.

The Swage

Meaning, in this connection, both the tool that spreads the point and the finished point itself. As has already been called to mind, the minimum width of swage, in order to put as little of the log as is compatible with good practice in the sawdust pile, is a much talked of thing at the present time. However, it is a thing, this small swage idea, that may be carried too far.

As to the proper width of the finished point, the best judgment of the filer must be brought to bear. Naturally, the plate should have sufficient clearance to prevent its becoming heated by friction against the sides of the cut. In my experience, five gauges of swage in addition to the thickness of the saw, I found to be about right. Possibly on soft, fibrous, stringy woods another gauge would better the running of the blade. Even in wood as has just been described, five gauges of swage will clear the first run after swaging; the trouble comes in the second run, when the points will be slightly too narrow for good fast work. A new trouble arises now and then, too, when one attempts to swage after each trip on the wheels; which comes in the matter of teeth crumbling and corners dropping off because of the steel having been worked too much in the business of spreading with the swage and pressing back to a sameness with the shaper jaws.

The swage—tool—should be adjusted so that the point of the tooth will be drawn out full, strong, and forward to preserve the pitch, which will prevent grinding away so much of the face that the backs become hollow very quickly. As there are many good swages on the market and in use, and as their dies and anvils are different in both shape and adjustment, it is impossible to set forth directions for grinding and adjusting. The makers of these tools, however, will answer any letters written them asking for information.

Where both hard and soft woods are sawn on the same mill, if the logs may be separated so as to run a freshly swaged saw in the soft and a second run saw in the hard woods, the filer will have reason to be grateful. The swage will be found to about fit the work in each case.

The Mill

First, the track should be straight and level; then the lower wheel should be level and in line with the V-rail of the track; then the upper wheel should be in line with the lower; and the mill base should be level and solid. Accumulations of oil and sawdust on the wheels are frequently sufficient in weight to throw a wheel out of balance, and thus cause heating of the bearings, in addition to being hard on the running saw. The columns that support the upper wheel should never be allowed to become gummed, rusted, or tight in their working; if such a condition occurs it will result in a stiff tension arrangement, which will not permit the weight on the lever to take up the slack, or overthrow, of the saw, when it enters the cut, and will produce an effect commonly called "bullheading."

It is a great fallacy to suppose that a great weight on the tension lever will force a badly fitted saw to make straight lines. No amount of weight will overcome fault in the blade itself, and the result will be only heated bearings or fracture in the saw—or, perhaps, both. Enough weight, however, should be used to prevent the blade slipping on the wheels in the heaviest cut, which will always be sufficient to keep down undue vibration if the saw has been fairly fitted on the bench.

Wheels are prone to wear most on the front edge, largely because of the grit that the teeth loosen from the log. When they become worn, a little deeper crown in the back of the saw will do much to overcome this feature; but the proper method of adjustment is to have the wheels ground true. This should be done by one who is competent, as badly ground wheels are as bad in effect as badly worn wheels. And to grind wheels, say the authorities, is better than to turn them with a lathe tool.

Handling Lumber at Lowest Cost

A lumber dealer in a small Iowa town has a lumber shed which is somewhat different from the ordinary shed; it has reduced the cost of handling building material from the car to the shed to a minimum.

The ordinary lumber shed usually has a longitudinal driveway. In this shed, however, the driveways, of which there are two, run laterally. The entire building is so situated with regard to the railroad switch that a small track which is laid in the driveway passes through the building to a point near the railroad switch; then in the form of a semi-circle, into the other driveway. Thus, it is only necessary to run a small car along this track, to a point in front of the door of the car to be unloaded. The lumber or other material is then loaded on the small car and pushed into the shed to any desired position. This method of handling obviates the necessity of loading the material from the freight car to a wagon and then unloading the wagon into the shed.

A device for getting lumber to the piles upon the upper deck of the shed is also used. This consists of a movable cage upon which materials to be put up may be loaded, and, by means of a hoist, raised to the proper height and run upon the proper pile. This case may be moved at any desired point over the driveway and suspended from any convenient rafter or girt. A separate hoist for each of the two driveways provides equal means for taking care of all the different grades of material handled in the shed.

Uniform Grading Rules

Wausau, Wis., Dec. 1, 1911.

Editor Canada Lumberman:

Your series of articles upon the grading and inspection of lumber have been of much interest to me. The work which you are doing along this line is most commendable and I sincerely hope that it will be effective. On this side of the line we have found uniform grading rules backed up by a thorough inspection system one of the most vital features of lumber association work; without it we really cannot see how it is possible to produce a standard prdouct. If you could get them to do it, it might be helpful if some of your lumbermen would visit one or more of the associations over here and get direct personal knowledge of how our work is carried on. I am sure that any of your manufacturers who wish to get such information would be most heartily welcomed.

Very truly yours,
R .S. KELLOGG.
Secretary Northern Hemlock and Hardwood Manufacturers' Association.

Editor Canada Lumberman:

From a recent issue of the Canada Lumberman I notice that you are not losing sight of the question of uniform grading and inspection of lumber. A few months ago several letters on this important question appeared in your journal and it was a step in the right direction. Over the border they have the national rules for inspecting and grading hardwood lumber. They grade it 1sts. and 2nds, and No. 1, 2 and 3 common and sell it on grade. This is the legitimate way of doing business. Why not adopt it here in Canada?

Our hardwood lumber is principally sold log run or common and better. In the true sense, what does log run mean? It should be the full cut of the unpicked logs and contain at least 30 per cent. of 1sts and 2nds, with mill culls out. The same rule should apply to common and better, but in many instances the good end of the stock has been picked out and sold at a fancy price. The dealer who buys the common and better, or log run, whichever it may be, is paying a good price for what he believes will contain the 1sts and 2nds, but when he receives the lumber he finds that it contains about 99 per cent. of common and 1 per cent. of better. So he is stung and has to accept the goods with no claim on the shipper for damages or loss incurred in the transaction. Do you tolerate this way of doing business?

Then again, there is another evil practised by some: that is the raising of grades and invoices in transit. Recently I was called upon to examine a car of hardwood lumber which was bought for No. 1 common and rejected by the firm; and rightly so, for the grade was No. 2 common. The lumber was unloaded and a settlement made with a rebate of $5.00 per M. on the car load. Would the dealer have done this if his lumber had been up to grade? No; and yet he had a fair margin on his deal. This is only one case. How many more are there and how long is this dishonest practice to be tolerated by honest thinking men?

By all means adopt the rules of uniform grading and inspection of lumber for Canada.

Yours truly, HARDWOOD.

The Shay Locomotive

In the November 15th issue of the Canada Lumberman it was stated that Messrs. Bloedel, Stewart & Welsh, Limited, has acquired the holdings of T. L. Shevlin and the Gulf Lumber Company and were building five miles of standard logging railway from Myrtle Point into the timber limits, the railway to be equipped with one "Shay" geared locomotive and a number of donkey engines from the Vancouver Iron Works. We are advised that the Shay Locomotive was purchased from The Hofius Steel & Equipment Company of Seattle, Washington, who are the agents for that locomotive in British Columbia.

A New Toronto Wholesale Firm

The C. G. Anderson Lumber Company is the name of a new Toronto wholesale firm with offices in the Manning Chambers. Mr. Anderson needs no introduction to the trade, having been connected with the lumber business in Toronto for a number of years, first in business under his own name and then as Toronto manager of the British American Mills and Timber Company, Limited, of Winnipeg, whose mill stocks in Ontario he has now taken over. Mr. Anderson has a thorough and practical knowledge of the lumber business and during the years that he has been in business he has gained a reputation for square dealing and prompt business methods that promises well for the success of the new company.

The Hardwood Manufacturers' Association of the United States will hold their next annual meeting at the Hotel Sinton, Cincinnati, Ohio, on January 30th and 31st, 1912.

Estimating the Annual Depreciation

Of Mill and Manufacturing Plants—Forcible Criticism of a Practice Which May Cause Unexpected Confusion

By E. W. Pollock

The subject of depreciations on mill and manufacturing plants is one which deserves concerted attention instead of individual treatment, in order that each one interested may have the benefit of the experience of all the others. But before united action is taken to devise a universal table of rules, much specific and general information must be collected and compiled. There are doubtless many expert individual treatments of this subject, but no matter how meritorious they be, unless they line up with custom to some extent at least, they cannot be adopted.

Nearly everybody's books in the mill business show depreciation—always annually and frequently by months—and the matter is reputed to be very important. And yet it requires only a few minutes' hard thinking once a year and the balance of the time is ignored.

The bookkeeper only rarely is trusted to place the depreciation on the plant and yet the owner who does is reluctant to rely upon his own opinion. He feels that somehow somebody ought to produce a schedule or guide to fit the case and that the bookkeeper should take it and apply it without bothering him, the owner. Being a detail it ought to be spared his attention. The boss may or may not realize that a definite rule is needed for the detail man to use, and one way to establish such a rule would be by concerted action by such a convention or association as this.

At present any bright bookkeeper can take the depreciation account and perform all sorts of juggling tricks with the plant account, the sinking fund and the dividends. But if there were a well defined rule to use by all it would simplify the matter very much. Averages are needed and one or two cases will not suffice to establish a rule. There should be many fingers in this pie.

Correctly Estimating Depreciation

The annual statement for the government under the excise corporation tax law will soon have to be made again, after the end of the current year, and information on the correct way to depreciate will then be desired by many. Each manufacturer should be posted on what the others are doing on this score in order to be consistent in his report. More annual statements are to be made out in future years and it will not do to wipe out the plant with one or two "swipes" (no matter if it hasn't been very profitable for this year), nor will it look very nice to Uncle Sam when he gets to looking over and comparing these various statements you send in, to find you all so very positive and certain about depreciation and yet all so very different.

A fire insurance adjuster, after a fire, entirely disregards the owner's rate of depreciation and replaces it with his own figures. A possible purchaser of the plant reduces the facts and reduces the values to suit himself and totally ignores the owner's attempt to fix the real values. The owner himself is anything but sure that he is right. Who then is it that is demanding that an otherwise accurate set of books shall be spoiled by inserting this annual guess?

Probably half the bookkeepers, usually acting under instructions or perhaps from habit, charge off 10 per cent. a year for depreciation. In twenty years' time this will bring a $100,000 plant down to $12,100. If the bookkeeper is more conservative and only depreciates 7½ per cent. on the same plant his remainder after twenty years is $21,000, while at 5 per cent. there is $35,200 remaining after twenty years. The bookkeeper means this to cover wear and tear and also something over for business uncertainties of various kinds. I would not venture to say which, if any, of these estimates is correct, but I do know a number of millmen who refuse to tamper with their plant accounts in this way, and these are the men who ride in 6-cylinder cars and find making money in the lumber business one continual round of pleasure.

I have talked with many millmen about this matter and doubtless whatever opinions I have upon the treatment of the subject are an average of all the opinions which I have absorbed. Now, while the universal custom is to charge off an arbitrary rate per year for depreciation, I can say confidently that most millmen believe their plants to be as good or better at the latter end of each year than they are at the beginning. Yet in the face of that they charge off an annual depreciation. Now, to me this is an irreconcilable state of affairs. Just why or how a manufacturer is willing to inject into his books of account at the end of the year his opinion or guess, where all other figures are made specific and definite, has never been clear to me. If a mill has a 10-year cut of timber ahead, or a 10-year lease of the ground upon which the property stands, it is perfectly proper to charge off such an amount annually as will wipe off the plant account at the end of the term for which it is needed, but do not call this depreciation, for it is not. If the owner expects to operate indefinitely and if he keeps a plant working at 100 per cent. efficiency at all times, I think that it is unwise and leads to trouble to deduct anything for depreciation. They tell me that they charge off depreciation so as to be safe. They say they do not want to fool themselves. They declare that the custom in general use makes it necessary. To these statements I reply that the practice is unsafe rather than safe, that it fools the owners, and that the custom among sawmill men at any rate, who are always spending money to keep their mills as good as new, should be discouraged. It is certainly embarrassing after a fire to show an insurance adjuster your books, wherein you, yourselves, have charged off a big percentage of wear and tear on your machinery and buildings, and at the same time ask the insurance adjuster to pay you from 50 to 250 per cent. more than your book values!

Does Not Apply to Run-Down Plants

I am not addressing manufacturers who let their plants run down, because I do not believe there are any such here. These are scarce, indeed. A different rule is applicable to that kind. I have in mind one such mill over on the Sound, run by a man who has never put a dollar into the plant for permanent repairs since he commenced operating it. It belongs to an estate, and the family which owns it will some day get it back minus wear and tear. This is a rare exception.

The common use of the word "depreciation" is associated with wear and tear. But the fact that this element of erosion is only one of the many and that the others are much more important in comparison, leads me to the conclusion that unless we can devise a measure for the others it is folly to measure this one alone. A rule to measure wear and tear is maybe easy, but who is going to make a rate which will measure the loss in value occasioned by new inventions in labor saving machinery, by loss of profitable markets, by depressing freight tariffs, by rival products which displace your goods, by hard times and bad accounts? All these elements affect the plant values and are more important than wear and tear, and so, I say, why look for an exact measure for the least important when there is no possible way to measure the others.

Why Depreciation and No Appreciation?

And, again, why should we always have a depreciation account and never an appreciation account? Does not lumber and brick and iron advance as often as it declines and does not each advance make the plant more valuable?

It is the general belief that somewhere there is a schedule or a rate which could be applied to this subject, and that once obtained and so used there would be no further trouble. I have been searching for this rule myself for about fifteen years, and it seems to me now that if I ever get one I will have to make it myself. In my experience among manufacturing plants, I have listed buildings up to 100 years of age and I have seen buildings 20 years old and less which had become obsolete and useless. I call fifty years as a fair average for the life of a wooden building. The oldest engine I have found in use in the West was one of 55 years and the oldest pump 35. Both are still running to-day. The oldest wood construction I know of about a saw mill is 45 years, and I have listed a planer which was declared to be over 50 years old! Twenty-five years' life for woodworking machines is not unreasonable to assume if we must confine ourselves to one figure, though the average opinion of millmen is 13 years.

Attempts to Collect Data

I have many times been asked by millmen whose plants I was engaged in appraising to supply them with a table covering the annual rate of depreciation on each of their various machines. Insurance adjusters use as their authority an insurance writer, who has supplied them with only a slight amount of detail, and he says that a woodworking machine wears out 12½ per cent. the first year and 10 per cent each subsequent year. To get firsh hand data on this subject, I lately have been collecting data by correspondence among practical millmen. The answers display a surprising amount of interest in the subject and a surprising lack of definite knowledge, but the main feature revealed by the answers, which came out very emphatically, was this: That saw mills in operation are up as good as new at all times and are often better at the end of a term of years of constant use than when they were constructed.

Now, it seems to me that, under these circumstances, the millmen who continue to charge off an arbitrary annual depreciation on anything about their plants except, perhaps, painting, roofing, piles and stable equipment, all of which wear out very rapidly, are wasting their time and putting their book accounts into hopeless confusion. If you are bound to have a depreciation account, then open also an appreciation account, for times come in the history of every plant when for two or three years the prices of building materials and machinery in general and labor and freight rates on machinery and various other elements of cost advance to such a degree as to more than offset all the wear and tear that they are subject to.

One Way to Keep the Account

If you are so wedded to the depreciation idea that you must have it, keep it on an obscure page of your ledger and, after taking a good look at it annually, tear it out and start all over with a new plant again. Then when the insurance adjuster comes it will be time enough to begin to discuss depreciation.

When the trust comes to buy you out let them suggest and prove, if they can, that your plant is not as good as new. When you pass in your checks and your widow takes up the frazzled ends of your business, she will be better able to get what belongs to her if there is no depreciation account on the books. In other words, do not bother with the subject at all until some occasion arises for taking it up. It is not a definite transaction and does not deserve a place in your books of account. It is merely an opinion, and as such is not competent to enter upon your records. Do not try to create a sinking fund with the depreciation account. Keep on the plant as good as new all the time and say so on your books.

International Endless Chain

The production of the endless chain saw for felling trees, crosscutting logs, etc., seems to have been the most notable achievement in the lumbering machinery world for many years. Although still a comparatively new invention it has attracted widespread attention, and is likely soon to be recognized as one of the most important inventions in the industry.

Before the invention and introduction of the endless chain saw the blade and teeth of saws were made in one integral part, so that the blade had to be reciprocated or revolved at the same speed as the teeth, with the disadvantage of requiring greater energy and less expedition in the work of felling trees or sawing up the logs and lumber. The construction of the International endless chain saw is apparant from an examination of the two illustrations herewith, one a tree-felling or stump-cutting machine and the other a log-cutting machine for reducing logs to lumber lengths, shingle blocks, etc.

With the endless chain saw the blade is stationary and the chain which forms the teeth moves. Thus the minimum weight is moved and the motion is continuous and uniform, instead of back and forth, as in the old form of saw. The saw consists of a thin steel blade with a groove in its upper and lower edge, carrying a flanged sprocket wheel at each end, through which the endless chain runs. The chain consists of an endless band of steel links with teeth of standard form on one side, and the necessary projections or sprockets on the other side, which fit into grooves in the blade and receive power from the driving sprocket wheel at the pivotal end of the blade. The smaller saws are raised and lowered by means of an arched frame operated by rack and pinion and hand crank. The larger saws, from 4 up to 20 feet, are raised and lowered from the tower by means of wire cable attached to geared drums, hand-operated, the weight of the saw giving the required feed. Any form of power may be applied in the operation of these saws, but the most convenient for the portable machines is the gasoline or electric motor. The power required for the three-foot six-inch saw is seven horse-power, and for the two-foot saw, four horse-power. In the tree-felling and stump-cutting saw the blade is so arranged that it may be used at any angle and the saw may be lowered close to the ground and the felling may be done at either side. A 20-inch tree can be felled in 20 seconds and stumps cut at the rate of 120 in 10 hours. A six-foot six-inch cross-cut saw is now cutting cypress logs into shingle blocks near Abbeville, Ga., at a rate hitherto unattainable. These saws are also used on the edge of log pond, where the logs are floated to the saw and away at little expense, the saw cutting the logs in the water as readily as on the log deck. A 10-foot portable saw with gasoline engine has cut trees eight feet six inches in diameter at five minutes per cut with an interval of five minutes to move the saw for the next cut.

The portable felling saw outfit weighs complete about 500 pounds, and can be carried by three men. The trees when felled may be crosscut into logs by turning the blade from horizontal to vertical position. In case of breakage of chain, it drops out entirely and only delays the work for a few minutes while replacing the damaged link. A spare chain is sent with each machine to allow for sharpening one while the other is in use. The power used for these machines may be detached and used for any other purpose desired. The saw may be used to cut cane, ice, etc.

The endless chain saw is manufactured by the International Endless Chain Saw Company, 34 University Place, New York, and catalogues fully describing the saw and machinery may be obtained by addressing the company.

Jointing Small Saws

Nearly any good workman that files or uses a saw, if asked about it, would say right off the reel that he recognizes the importance of carefully jointing his saw before taking it off and filing. Yet the fact remains, even though they claim to recognize the importance of this, they continue to do in a careless, not to say reckless manner.

The useful practice is to pick up a piece of grindstone, piece of broken emery wheel, or something of the kind, rest it on something, and bring it up to the running saw until it engages the teeth and grinds them off a little. While being ground off the teeth cut a groove into the piece of emery or grindstone—the usual saw-jointing piece lying around has a regular series of these gashes cut in it—they go ahead using it, notwithstanding the fact that we know, if we but stop and think a minute, that these very gashes spoil the jointing. Say the saw cuts into a piece of abrasive. It is jointed on its corners and down the sides until really the jointing off is spoiled, so far as trueness is concerned.

The only way to joint a saw is to take something that is positive, hard and unyielding, that will do all the cutting, but that the saw will not cut a gash into. One of the most convenient, practical plans is to take a piece of flat file, say about 2-in. or 3-in. of the point end of either a 10-in. or 12-in. mill file, fit it carefully into a piece of wood, with a handle attached so that it can be brought up to the saw in such manner that it will cut the long points off the saw teeth, and do it positively. In attaching this piece of file to a block of wood for this purpose, keep in mind that you want it to cut. Therefore, turn the point end up, so that as the saw teeth strike the cuttings in the file they will do their duty, and not merely scrape—so that they will make a clean cut in reducing the long saw teeth points to a true circle.

When you do this, and do it carefully, you then have something dependable to work to, whereas the careless habit too many have of using a piece of emery wheel, broken grindstone, or other abrasive material, that the saw cuts into, is really prolific of as many errors of its own as it corrects in the circle of the saw.—J. M. in the Wood-worker.

At a recent meeting of the B. C. Tax Commission held in Fernie, interesting evidence was presented by Manager Duboise of the Elk Lumber Company. Mr. Duboise presented startling figures about the large amount of United States lumber which had been sold in the prairie provinces during the past season and suggested that some relief might be afforded by a reduction of the taxes levied upon lumber.

The methods of cutting veneers, either right or wrong, are as different as day is from night. Some of the greatest difficulties were recently discussed by a number of veneer men, some of whom argued that when veneer stock came from the knife uneven on the surface it could be made flat in the drying, while others claimed that it first had to be cut even in order to make it lie flat. As a matter of fact, the latter way is the only correct method, affirms the "Hardwood Record." The veneer is cut and scored in the centre during the process of cutting. The tendency of veneer is to diverge as it leaves the knife instead of moving in a straight line, the cause of this being due to an uneven cut at the knife, or an improper adjustment in the tension bar. On placing a long log in the veneer it will have a tendency to buckle in the centre, which cannot be noted by the naked eye. A hair's breadth will have the effect of cutting the veneer uneven, or if made in two pieces, will cause it to run crooked as it leaves the knife. The tension of the log increases directly in proportion to the length, consequently the tendency to buckle will be greater. The smaller the circumference of the log the more effect this will have. Thus as the knife gets down to the core, the more this tendency will be noted. There is but one satisfactory method of overcoming this tendency, and that is to adjust the pressure bar. Different logs vary so greatly that the pressure bar.

Logging Under Government Supervision

Forestry Principles Applied to Lumbering Operations in Western Canada—Methods of Disposing of Brush—Precautions Against Fire

The lumbermen of Canada have heard a great deal about conservation these last few years and have doubtless read much about how foresters would handle logging operations, if they were given a chance, so as to do away with the fire danger and prepare the forest for another crop by promoting the natural reproduction of valuable timber species. The lumbermen of Canada have now for the first time the opportunity of watching logging operations being conducted under regulations drawn up and supervised by foresters.

There are at present five different timber sales in progress on Dominion Forest Reserves, which are being handled according to the principles of forestry.

One of these sales, in the Englemann spruce and lodgepole pine belt of the Rocky Mountain Reserve, has been in force for several months.

One sale, on which logging is just now beginning, covers about fifteen square miles in the Riding Mountain Forest Reserve in Manitoba. The three remaining sales, on which logging will begin in January, are for tracts of green timber, chiefly spruce, with a mixture of jackpine, tamarack, birch and poplar, all in the Riding Mountain Forest Reserves.

A brief consideration of the regularities under which these sales are being handled will show that the lumbering industry has nothing to fear from such regulations as those drawn up by the Dominion Forestry Branch.

The amount of timber to be cut is estimated by a representative of the Department, and an upset price per thousand feet is set. This price varies with the quality, accessibility and marketability of the timber and is always fixed so as to allow a proper logging and manufacturing profit. The timber is then advertised for sale, all bidders are notified in full of all the regulations governing the cutting of the timber. The privilege of cutting the timber goes to the bidder offering the highest stumpage. There is no other payment beyond the stumpage; neither a bonus nor a ground rent is charged. The absence of these charges enables the bidders to figure more closely the price, they can afford to pay for the timber. They run no chance of paying for what they do not get.

The first condition under which the sale is made is that the timber shall all be removed within a specified term of years, a certain proportion being removed each year. The idea is that timber from forest reserves will only be sold to actual operators as there is a need for it, that the operator will be given long enough time to remove the timber, but that he will not be allowed to hold it for speculative purposes.

When small quantities of timber are being sold to the operators of portable mills it is required that the mill shall not be of less than twenty-five horse power, and that it be furnished with proper equipment including saw edger, trimmer, planer and matchers, and the carriage be well set and the machinery in a good state of repair. Where these requirements have not been insisted upon it has been found that the lumber has been butchered by the owners of poorly equipped and poorly handled mills, and that settlers who were dependent upon such mills for lumber have been compelled to accept very inferior stuff. Such a restriction as to equipment does not apply to a large mill.

It is always required that the cutting be confined to the area marked out by the officer in charge of the operation. This area is not defined by arbitrary straight lines such as land subdivision boundaries or timber boundaries, but is defined only by the nature of the country or the boundaries of the timber which it is thought wise to cut over. In a mountain valley the area would extend as high as merchantable timber reached. There would be no merchantable timber above the edges of the tract sold, as is so often the case on timber berths whose boundaries are defined by straight survey lines.

The purchaser is put to no expense to survey the boundaries of his timber. The boundaries are marked clearly by an officer of the Forestry Branch.

It is always required that stumps be cut with a saw and that no stump be left over eighteen inches in height. Of course, judgment is used in enforcing this regulation. If, however, stumps are left higher than the limit imposed when they might easily have been cut lower, they are counted and the operator charged double the fixed stumpage dues on the timber left in the stumps. This amounts to quite a lot on a large operation.

Where the logging operations are in green spruce it is required that no trees shall be cut except those marked for that purpose.

The marking is done by a forester whose aim is to remove all mature or defective timber and to leave for further growth all young thrifty trees. The most experienced men available are secured for marking as it is a task requiring great judgment. Trees are marked for removal which will of necessity be damaged by the falling of their neighbors, also those trees which are likely to be windthrown. Where the logging is more expensive a larger proportion of the trees is removed so as to reduce the logging cost per thousand feet. The aim in marking spruce in Manitoba is to remove all timber which is mature, and to leave only those trees which are needed for seed trees, are making a very thrifty growth or are too small to be utilized at present.

The contract requires that all timber must be utilized, that no merchantable timber be left in tops, lodged trees or scattered logs not picked up. The forest ranger in charge of the operation is required to scale up all timber so left and double dues are charged. This provision encourages careless operators to pick up everything merchantable, to vary their log lengths so as to leave no timber in the tops and results in leaving the ground much cleaner.

Where there are two or three species in mixture, such as spruce and poplar, the spruce being valuable and the poplar without a market the regulations forbid the use of spruce for skids, head blocks, road construction or the erection of buildings. The operator is allowed to take poplar for these purposes free of charge. This regulation has the effect of removing a portion of the poplar and making openings for further extension of spruce in the next crop of timber.

Disposal of Brush

The disposal of the brush after logging operations, because of the importance as a source of fire danger and because of its effect on the next crop of timber, is one of the points requiring the closest attention. One condition under which timber is sold by the Forestry Branch is that the brush shall be lopped and scattered or piled for burning according to the instructions of the forester in charge. In spruce operations in Manitoba where the snowfall is heavy the brush may be safely disposed of by lopping and scattering. This can be done when the trees are being cut into logs. The cost is not known but it is expected it will vary between 20 and 40 cents per thousand. A portion of the brush will probably be piled for burning, both to see what the cost is and to see what the effect will be on the spruce reproduction. Burning will probably be done by the forest rangers in the spring before the fire season.

It is stipulated that as little damage as possible will be done to the young forest growth, especially that of the most valuable timber species. The forest ranger in charge of the operation is instructed to see that in road building no young spruce poles are used, that roads are not constructed through clumps of young trees and that in skidding young trees are not damaged in any avoidable manner. The prevention of the destruction of the young timber, so far as is practicable is one of the best manners in which the Forestry Branch can secure another crop of timber.

All timber cut is scaled by the forest ranger before it leaves the mill. Because of the small average size of the log which would result in a fairly large over-run if the log scale were depended upon, the actual lumber production is measured, not the logs.

Every mill situated within a forest reserve must, before the beginning of the fire season be surrounded with a satisfactory fire guard. The operator is required to exercise constant supervision to see that fire does not start from his operations. If a fire does start in any way which threatens the tract he is cutting he is required to supply all his men for fire fighting without cost to the Government.

Judgment is used in the enforcing of all these regulations, and it is not expected that they will at any time result in hardship for the mill operator. Should any operator refuse or persistently neglect to work according to the spirit of the regulations, right is reserved in the contract to suspend the operations or revoke the contract.

Mr. Miller, of Miller and Seim, lumber dealers, Hampden, Ont., was a welcome visitor recently at the offices of the Canada Lumberman and Woodworker.

The Retail Dealer and His Problems

Making Customers from Prospects

How the Live Lumber Retailer Handles his List of Prospects, and follows them up personally

By J. T. Carpenter

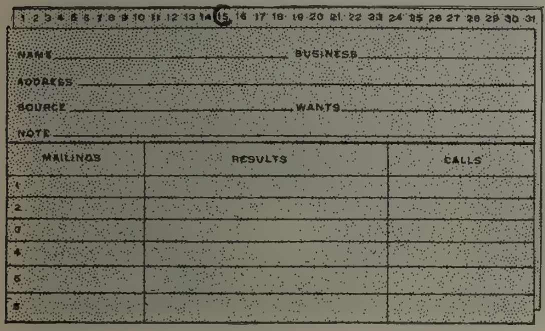
From the various sources upon which he draws, the lumber dealer may assemble each week, a handful of newspaper clippings, business cards and envelope-back memoranda bearing the names of prospective customers. He has reason to believe that these men are in the market for his commodities. He faces the problem of drawing them into his office and winning their trade.

To make these sales in the town of three or four or twenty lumber yards demands method. The memoranda should be assigned to the routine clerk, and a follow-up card should be placed on file for each name. These cards will bear the prospect's name and address, the source of the name, any information of a personal nature that might influence the order-getting and a note as to whether the prospect desires concrete block, frame construction, repair material, roofing, fencing or material for interior work.

Every card should indicate whether the prospect is a renter, landlord, intending builder of house or business structure, farmer or building trades worker. Each dealer must decide for himself how far he can profitably carry this classification. The more minute his division is, the more personal can he make his letters. In circularizing, however, every such change of copy is costly.

Different classes of prospects may be entered on cards of different colors; as repair prospects on blue cards, house builders on white and factory or store block builders on red cards. Various notching, checking and paper clip devices are also used for this classification. Choice among such schemes depends on the extent of the file and the dealer's personal acquaintance with his list. The smaller the business, the better the dealer's own personality can serve in place of memoranda and filing schemes.

Whenever a call is made, or a letter and piece of advertising are sent to a prospect, this fact should be noted on each card. The various circulars and letters should be designated by number, which, (with the date, and later, the outcome of the follow-up) can be quickly noted in the correct columns. Reference to these cards will then show just what circularizing has been done, and make it easy to avoid doubling on prospects which not only costs money, but loses sales.



Form I (front card): The card kept of every prospect who may be reached by the lumber company. Form II (back card): The file card bearing dates of the month by which prospects are followed up.

The date of the next follow-up may be brought to the file clerk's attention either by dated index cards or by paper clips.

Under the first arrangement, forty-three guide cards are necessary, one numbered for each of the thirty-one days of the month, and others lettered for each of the twelve months.

During the winter, very little use will be found for a follow-up. At the approach of the spring building season, however, the list ought to be revised and prepared for action. On February 15, for example, you may decide to circularize a list of one thousand names at the rate of one hundred a day, and to follow them up in ten days.

The prospect cards will now be sorted according to the desired dates of follow-up, should any names demand especially urgent treatment.

Should the dealer wish to follow certain urgent prospects, or should he plan, for one day, a letter to householders on repair suggestions, for another, a factory letter, and for a third, a note discussing the farmer's needs, however, it will obviously be impossible to maintain both the daily and the alphabetical classifications just described.

To meet this condition, file cards (Form II.) are used bearing the days of the month printed across the top. These cards are filed in strict alphabetical order. Cards for prospects who are to receive different circular letters will, as suggested, be of different colors. Paper clips will then be procured on which appear the name of a certain month. At the beginning of the spring campaign, February clips are placed at the top of the cards, over the days of intended follow-up. All the clips for the sixth will then appear in a straight line from front to rear of the file drawers, and an instant's attention will separate those of February from any prospects in the same line, to be approached on the sixth of March or April. After the addressing is done, the clips are moved to the sixteenth. March clips will of course be used for the next follow-up.

Regularity and Tact

This is the rule of any sales campaign, and the problem of prospect follow-up is the problem of selling. The dealer must know what his trade demands. He must be seasonable in his offers, his letters, his personal solicitation.

Frequently construction work is sighted, so important, so large or so urgent, that timely personal solicitation is demanded on the lumberman's part.

Lumber retailers have met with marked success in this follow-up of rural free delivery lists. This use of the country prospect list makes a geographical division of the cards desirable—an arrangement which in turn sacrifices the alphabetical order. The cards are filed in order of the prospects along the roads or routes followed by the dealer in making his trips, and the dates are indicated by clips, as described.

These five features of business-getting follow-up may well take the form of rules:

1. Keep the prospect list live—up to the minute.
2. Make your copy as seasonable and vital as your list.
3. Base your solicitation on real values and a real inducement for immediate action.
4. Give your prospect something to sign and mail; profit by his action while he is in the mood.
5. In your letter or circular, catch the personal tone and reach the mutual ground which the salesman has to attain before he can book the order.

Dealers are apt to grow careless and carry names which are hopelessly bad risks.

Seasonable copy is another strong point to be considered. Each month at the time of issuing statements, a single choice bit of advertising goes to each person on the list. Envelope-size folders, booklets and blotters are ordinarily used. The copy is never twice alike, and always emphasizes some particular department of interest at the time; window and door screens in April, storm sash in the fall, tobacco sticks and fencing in season.

The Comer & Searce Company, of Mooresville, Indiana, used the familiar clearance sale argument to hasten buying. They sent out circular letters telling of the annual housecleaning under way in their yard; of the bargains which had come to light in lumber, posts, roofing, doors and sashes. Display and local advertisements in the newspapers supplemented these letters.

And then to take advantage of this persuasive element, dealers have tried many enclosures. A sample paint card has been used, with a request to check the desired color; a specification blank asking data on which the dealer may base a bid, a post card requesting that an appointment hour be filled in, to discuss plans and estimates.

In all these devices, the aim is to bring the prospect into contact and co-operation with the merchant. If he can be induced to sign his name to a request, he will not forget the dealer and will be more approachable thereafter.

The personal letter which begins with a solution of the builder's perplexity over floor plans, or his difficulty in getting desirable material, is an excellent example of right follow-up.

This appeal to "your interest" is not limited to the letter, however. The follow-up used by an Oklahoma dealer in search of rural trade consisted of colored postcards which served to amuse the farmer's children and excite questions for the farmer to answer. Slight as it seemed, there was a point of contact.

Several dealers issue post card views of buildings erected from their plan books and of their materials. An Iowa dealer lists the well known business blocks in which his mill work was used. A Chicago dealer in fine interior woods names the palatial city hotels and banks for which he has supplied panels and doors. The appeal in all these cases is to the universal inclination to see results before we buy and to follow the judgment of the men about us.

Explanatory copy also has a strong personal appeal. Two little booklets entitled "From Tree to House," and "Next to the Bark," distributed by the Combs Lumber Company, were business-getters because they combined straight selling talk with a description of lumbering processes from virgin forest to polished wainscoting.

The Necessity of a Good Cost System

By Alexander T. Deinzer

The writer has read many articles of late treating on cost-finding. Associations are now being organized for the purpose of devising uniform cost systems. In view of the fact that but very few furniture manufacturers and planing mill men know what their goods are costing, and as the curse of the furniture manhfacturing business is this lack of information, I will endeavor to briefly suggest some of the important points to be considered when installing a cost system; also, what such a system should and must show.

One of the most dangerous pitfalls in every manufacturing business lies in either inability or unwillingness to know the exact cost of production. Competition is becoming keener every day, and a few cents, more or less, either way, may mean certain ultimate success or failure. There is no information placed before the manufacturer that is more important than an accurate computation of the cost of manufacturing each separate article which he sends forth into the markets of the world.

An actual cost system, to be trustworthy, must take into account all the factors entering therein; it must be a matter of judgment founded upon observation, and a constant vigilance on the part of those in authority. Unfortunately many manufacturers consider a cost system nothing more than a lot of "red tape," and insist upon keeping down office expense salaries. Some of the old-time manufacturers will tell you that they operate a wood-working plant and have no time for fancy figuring. Furthermore, they have been in business for the past forty years and made a success of their business. However, in many cases they will tell you that within the past ten or fifteen years they have made very little or in recent years have lost considerable money.

Years ago our forefathers received long prices for their manufactured goods, adding from 100 to 150 per cent. to the cost of material and labor, which well covered overhead, selling and margin. Can this be done to-day? Unfortunately, it cannot. Strange as it may seem, it is nevertheless true that in many furniture and other wood-working plants the manufacturer permits the salesman to guess the price on the new article manufactured, the manufacturer supposing that John, who is in touch with competitors' prices on similar patterns, knows what the goods will bring. Nine times out of ten John will name prices which will be to his advantage, for he is paid to sell goods, and if he can show up annual sales from $100,000 to $200,000, then he has more than made good on the job. It is an easy matter to sell gold dollars at 50c. each, but it requires a salesman to sell goods at a profit. The fact that the manufacturer does not know what his goods are costing is the reason of most failures to-day. Enough distance between cost and price is not observed.

Sir Thomas Lipton stated, when asked how to succeed: "There is no royal road to riches, and in a business as big as mine, no back lane. My methods are open and anybody can see them. My receipt for prosperity is: Work hard, deal honestly, be enterprising, exercise careful judgment, advertise freely but judiciously, and understand your costs." There are no secrets about cost-keeping; much is written and preached upon this subject every day.

I stated above that many associations are now being organized for the purpose of devising uniform cost systems. I know of nothing that will prove of greater value to the furniture and wood-working manufacturing trade generally. Benefits derived from individual concerns cannot be compared with results obtained from uniform association costs. It is well worth the time and money for manufacturers to meet, say, once or twice a year, and discuss the important questions confronting each and every manufacturer. Your competitor is not a bad fellow, and you will be surprised how friendly and willing he will be to co-operate if he is but approached in the matter. If your competitor is making money and is producing goods cheaper than you can produce them, learn the reason why; and this cannot be accomplished otherwise than by co-operation.

There is no way that so much can be done for an industry as through agitation of cost-keeping, and I believe that associations can, through this method, be the means of very greatly improving present conditions. A thorough knowledge of cost in all furniture factories would also be the means of almost entirely stopping the habit of copying designs, making them from one to three dollars less on a speculation. If you do not know what your goods are costing, what are you doing but speculating? Get all the information you can on cost accounting and read up on the subject. The highly intelligent articles appearing in our trade journals should be carefully perused by not only the manufacturer, superintendent and foreman, but by the workmen as well. Unfortunately, these papers do not receive the appreciation they so readily deserve.

It is not the intention, as has been stated, to outline a specific system for ascertaining factory costs, but to briefly mention what a cost system must show. Among the important things it should do: First, ascertain the cost per unit on each piece manufactured: second, record the amount of time spent on each operation or each order; third, show location in plant and the condition of work on each unfinished unit; fourth, show the amount of productive and non-productive labor, and for what the non-productive is used; fifth, show relative overhead and direct labor cost per hour, or per unit, in each department; sixth, show whether each operation is increasing or decreasing in cost, and, in its final analysis, whether you are making goods at a profit or loss.

In planning a cost system for your factory make the system as simple as you possibly can, so that every foreman and employee will readily understand it. Although excellent systems, both complex and simple have become general in the United States, yet many cost systems are so complex that, with the multiplicity of details, their real purpose is almost lost. Besides, they add an enormous expense to the product. Employees do not want to be antagonized with complicated systems. The man who puts in a cost system must have plenty of experience in a practical way, as well as theoretical knowledge of accounting. Unless he has full knowledge of all details of the business, it would be better not to install the system.

The basis of a sound cost system is accuracy in bookkeeping, a correct inventory and exact data for the cost clerks. Another thing in favor of a good system is that it has for its main object the determination of the efficiency of men. The system should tell you daily what each man has accomplished, who are your good men and who are your lazy men. It shows you whom to discharge and whom to promote. It also tells you whose wages are too high and whose wages are not high enough. You will learn what men to appreciate, as every man well hired is an investment for your company. Give your employees a square deal and you will protect yourself against strikes. When a man "does not make good," either discharge him or try him in some other department.

The Element of Humanity in Management

When you install your cost system make your superintendent and men see the new ideas. Many employees are never glad to see changes. Explain to them what benefits are derived from such a change, and that they are also benefitted thereby. Consider your men and handle them diplomatically. Unless your employees co-operate with you, it is useless to consider such a system. It certainly pays better to spend time in educating and training men than to spend time in tongue-thrashing. The modern manufacturing plant cannot afford the old-time foreman who mingles the functions of a spy with the functions of a mule-driver. Of late years it has been discovered that systematic training of the least intelligent workman pays as well as the training of the most intelligent. The human element is one of the most important factors of management.

Another factor of importance is that men be praised and encouraged now and then. Every person has his or her peculiarity of personality and temperament, and it is up to the manager, superintendent or foreman to become thoroughly acquainted with his men.

Do not load your men with duties. The fewer the duties that any man has to perform, the easier it is to find men who can perform the task well. After winning the confidence and co-operation of your man, next turn his attention to loyalty and enthusiastic service. Place at his disposal machinery and tools which will prove the most economical.

Accurate cost systems and scientific management have attracted more attention during the last year than any other subject. Manufacturers are appreciating that only through such methods can cost production be decreased, output increased, wages raised, labor troubles eliminated and the quality of the work improved generally. These subjects involve the investigation of many phases of work, tools, and even managers themselves.

Scientific managing is by no means foreign to the subject of cost-keeping. The subjects are closely related, and one deserves as much study and consideration as the other. The writer may decide to write more on the subject of scientific managing for some future number of this paper.

One of the methods of obtaining production time records is to use daily time cards. A job card record may also be used. When the so-called job ticket is used, it is well to carefully date each card, inserting hour and minute when commencing job, and doing likewise when job is completed. The mechanical time-recorder is one of the best schemes I know of for recording time, as by this method a dishonest employee cannot so readily "doctor" his card as when writing, as is sometimes done. Every employee should also insert his number on the job card. All cards collected should be checked against the time reported by the time-keeper. File all cards belonging to the job in one folder, for in so doing comparisons with previous jobs can readily be made, and the foreman or superintendent can trace any card without looking up the matter in the factory.

When drafting your form time card, do not make it too complicated. One of the common faults with time cards is that too much depends upon the accuracy and clerical ability of the employee. He does not usually appreciate the importance of the time records he is expected to keep. If you design a simple card he will gladly cooperate with you. This is especially the case with foreigners, who do not care to admit that they do not understand what is expected of them, and as a result the cost clerk receives information which is absolutely worthless. Many very highly-educated men are employed in wood-working plants, yet, as is the case with manufacturers of all lines, many are also employed who lack the training for such work, but, who, after all, are perfectly willing to do the square thing.

Herewith is shown a form of cost card which is very simple and can be applied to nearly any wood-working plant. I might suggest that different-colored cards be used for every department. In using this form the workman simply marks his time when commencing job, in proper place, and checks operation. When job is completed he inserts time in space indicated as finished date. The time can be computed by the cost clerk, who is, after all, a non-producer, hence the producer's valuable time need hardly be taken for this work. The same style of card (changing operations, of course) can be used in the cabinet, finishing and other departments.

When the cost of labor is well understood and properly carried on, we must next direct our attention to material used. So much has been written on this subject that the writer will not at this time state just how to determine cost of material, including waste, etc.

The overhead or burden should next be applied. A fixed percentage cannot be stated, and the overhead varies in all factories. The burden must include such items as general and operating expenses, salaries, office help, depreciation on plant and machinery, interest on money invested, repairs, power, etc. This percentage should be compared at least once a month.

Repairs on imperfect work must be taken into account. Open an account, "Repairs," and charge all productive labor applied on this work, likewise material, to this account. This account will no doubt prove of considerable interest to your superintendent and manager. As will be understood, this item must also be included in the overhead or burden.

Selling and advertising is next considered. This item varies with many concerns from 10 to 50 per cent. on amount of gross sales. Be a liberal advertiser and allow enough for this item.

One formula therefore for ascertaining cost is and must be: Cost to make and sell, plus profit, equals price; prime cost, plus direct factory expense, equals factory cost; factory cost, plus general expense, equals cost to make; cost to make, plus selling expenses, equals cost to make and sell; cost to make and sell, plus profit, equals price.

No matter what may be said or written, this is the only correct way to determine cost. The formula will remain the same, regardless of different expressions or phrases. Essential facts are what we must have, and they are included in this formula.—The Woodworker.

Credit Sales and Price for Contract Work

It may or may not have occurred to the average retail lumberman that he has more than a passing interest in the price at which contract work is let and for which he is furnishing the building material, says the Mississippi Valley Lumberman. It is as well known that the bulk of the retail sales of lumber in the country are made on credit as it is that this practice will probably continue in spite of the efforts and talk against it. And a very considerable portion of the lumber that goes out of the retail yard is for work being done by contract, and for which the contractor is the debtor. It is equally true that the average retail lumber dealer will say that it is this class of sales that yield him the smallest percentage of profit, because it is the kind of business on which there is the keenest competition. It would, then, seem the wise course that the retailer be informed of the price at which the contractor has undertaken to do the work for which he is furnishing the lumber. Of course, the dealer is protected by the lien laws; but it is considerable of a nuisance to file liens on every building for which lumber is furnished, and, in case of failure on the part of the contractor to meet his obligations it is expensive and annoying to undertake the legal processes nesessary to secure payment, to say nothing of the possible ill-feeling that will be engendered.

Conditions in England may be somewhat different from those existing in this country, but in general application there is probably much similarity. In a recent issue of the Timber Trades Journal, of London, the editor says, "Only the other day we noticed that a firm secured a contract at forty per cent. less than the highest tender. In contracts of to-day there is no such margin of profit to admit of this difference. Raw material for construction has a general parity of value, and the schedule of quantities cannot to any great extent be reduced, especially where the work is executed under the engineer's or architect's supervision. The standard rate of wages must also be paid. It is therefore inevitable that if the contractor without capital goes wrong it is the merchant who suffers, and to be precise, it is the timber merchant upon whom the greatest loss falls, giving his six months' credit, as in the iron, stone and brick trades the terms are monthly.

"Yet we find people who are able to obtain unlimited credit. Whether or not this arises from the internecine competition in the timber trade to obtain business, may be debatable; it certainly cannot be alleged that the timber trade in the main lacks a keen sense of commercial acumen. The question then arises, how is it possible for such rank outsiders to obtain unlimited credit. We are driven to the conclusion that it is the weak merchant, anxious to secure business, who takes risks which the established firms would shrink from. In many cases, the contractor, unable to obtain credit with the latter, pays (on paper) higher prices than would be quoted elsewhere."

We fancy that there are many points in this quotation from the English paper that will appeal to, and be recognized by, the lumber dealer on this side of the water. Not only in the matter of contracts, but in straight sales to the consumer, the dealer takes many chances. In old established communities the dealer has usually learned the paying disposition and ability of most of his natural customers, and loss is less likely. It has been frequently stated that customers of doubtful credit are charged more for their goods than those whose ability to pay is not questioned. Would it not be more logical for the dealer to charge the hard customer less, for, in case of loss the amount to be charged off will be less.

It certainly is the experience on this side of the water that contract bids for work will vary as much as forty per cent., and it is equally true that there is no such real variation in the cost of doing work that is well done. Under these conditions it would be well for the men who are to furnish the material to know something of the price at which contracts are taken. This would enable them to judge the ability of the contractor to make a profit on the work, and to determine their chances of receiving full pay for the material without the necessity of legal proceedings under the lien law. This, of course, in case there is any question of the financial ability of the contractor.

Mahogany

It was but a few years ago that mahogany was regarded as a precious wood, and was employed only in the interior of the very finest private houses, and for the making of the most expensive furniture. During the last few years there has been a wonderful development in mahogany importation and use, and it has become one of the foremost departments of the lumber industry.

The statistics of hardwood consumption indicate that to-day the number of buyers of mahogany in this country is exceeded only by those of oak, maple, poplar, basswood, ash, birch, chestnut and cypress. This is a wonderful standing for the "aristocrat of woods," with its higher prices, in competition with native forest products. Of course there is good reason for the popularity of mahogany. The importers of the logs and the manufacturers of the lumber have never advanced its price beyond a very modest profit, and it is relatively so low that it now makes little difference in price whether an office building is finished in mahogany or quartersawn white oak.

Another reason for the popularity of the wood is the fact that it is one of the few lumber materials that improve in tone with age. After much experimentation leading car builders of the country finish practically all their cars in mahogany as being the one wood that will stand the severe usage and hold its finish better than any other material.

Statistics of the Trade and Commerce Department, just issued, show that Canada's sales of printing paper to the United States for the five months ending August 31 totalled $739,359, as to $785,931 and $256,561 for the corresponding periods of 1910 and 1909. The exports of Canadian pulp wood to the United States for these five months' periods were in 1909, $2,817,291; in 1910, $3,393,552; and in 1911, $2,568,352.

Interest is already being aroused in connection with the new timber policy of the British Columbia government. This will be brought down at the session to be held immediately and will be perhaps the most important legislation of the session. It will be based on the report of the commission which reported a year ago, but too late to allow of the recommendations to be embodied in a bill for the session last January. Material changes will be made in the law. It is probable that some amendment will be made in regard to the method of taxing timber, though this will not be comprised in the timber bill, but will come down later, when the recommendations of the taxation commission, which has just concluded its sittings, will be considered.

CAMPBELL-MACLAURIN LU

Mills and Yards of the Campbell-MacLau

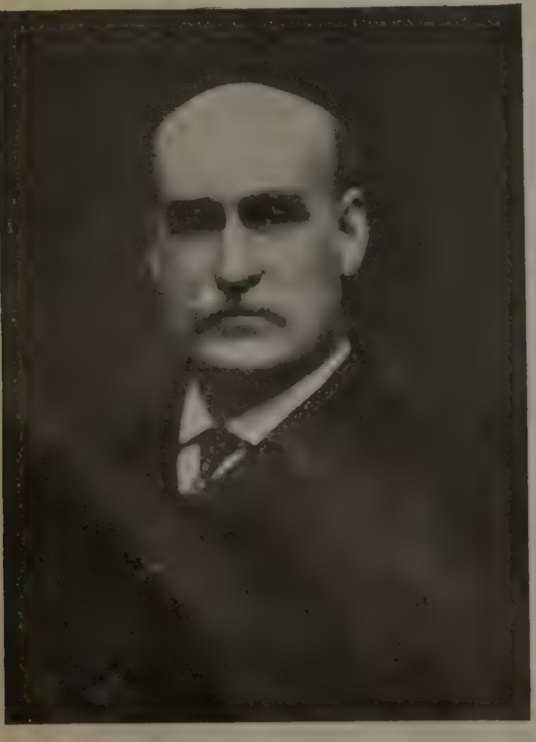
A Successful Lu

What has been Accomplished by
Co-operation—Spruce their Speciali

BEFORE giving a sketch of this company whose legend is "Everything in Spruce," but whose operations are not confined wholly to spruce, it will interest our readers to have in a summarized form the reasons given by Mr. Arthur H. Campbell, the Managing-Director, why the Company has specialized in spruce. Mr. Campbell says:—

"The general public have not sufficient technical and commercial knowledge of the different kinds of lumber to fully understand the many advantages spruce has for a great many purposes over other lumber whose place it could take. In fact, a great many of those fairly familiar with lumber and building operations have not gone sufficiently into the question to understand it fully.

"As a matter of fact, spruce is very rapidly displacing other woods in the market, and we are doing our share toward making the change."



Alex. MacLaurin—President

Quoting from an article by Mr. H. R. MacMillan in the "Canada Lumberman," Mr. Campbell showed that in 1909 spruce was the leader in the lumber production of Canada, as it formed 29.5 per cent. of the total, white pine 27.4 per cent., Douglas fir 12.3 per cent., hemlock 7.9 per cent., and red pine 4.4 per cent. Of the 965,000,000 lath manufactured in 1909 in Canada worth about $2,400,000, about one-half was spruce, and one-third white pine. The remaining fraction was made up of cedar, hemlock and Douglas fir.

In saying that spruce is rapidly displacing other woods," continued Mr. Campbell, "I refer more particularly to white pine, for flooring purposes, and Norway pine for joisting and timbers. This does not mean in every case that it is better, but it is at least equally as good and decidedly cheaper, and the reasons are commercial and economic. Taking the matter of lath, it is somewhat remarkable that there seems to be local preferences; thus in Toronto, Hamilton, London, Buffalo, Rochester, and some other cities, the preference is for pine lath although the price is higher, but on the other hand, in New York, Boston, Philadelphia and some other large cities, the choice is decidedly for spruce independently of the price."

"The fact is, in regard to lath it is rather a matter of individual choice, and this being the case it is remarkable that spruce is not more generally used in Ontario when it is as easily procured and much cheaper."

As Mr. Campbell's company is amongst the largest distributors of lath in Eastern Canada, handling not only spruce but white pine, red pine and hemlock, in many cases the whole output of large mills, he is in a position to give a somewhat conclusive opinion on the relative merits of the different kinds.

"In the matter of flooring, the choice between spruce and white pine depends upon the facility for obtaining and the relative prices. The advantage in spruce when obtainable is wholly in the price, and while white pine no doubt makes a better flooring, when spruce will meet the requirements of the case it is naturally preferred on account of the difference in price. Of course for under-flooring where there is no exposed surface, the advantage is wholly with spruce. In connection with the question of flooring, it cannot be impressed too strongly on the minds of users that spruce must be thoroughly dried, otherwise the shrinkage will be a serious matter and this is responsible in many cases for the opposition to spruce for this purpose.

BER COMPANY LIMITED.

nber Company, Drummondville, Que.

ber Organization

gy, Business Judgment and Staff
escription of Mill and Property

"In Montreal for flooring of factory construction spruce is used almost exclusively, the principal sizes being 2 x 3, 2 x 4, 2 x 5, 3 x 3, 3 x 4, and 3 x 5. It is generally planed four sides and beaded on under edge and laid on edge, making a ceiling for lower flat. The advantages of spruce for this purpose are its non-inflammability, its durability and its relative cheapness. These combined qualities are not found in any other wood, and as the amount used in work of this kind is very large—some Montreal factories requiring nearly half a million feet—the use of spruce means considerable economy as well as safety."

Passing from ordinary flooring for houses, etc., Mr. Campbell referred to a quality spruce has that makes it preferable to any other wood for flooring for traffic purposes, bridges, etc., that is that it gives a better grip to the horses' feet, preventing slipping. To illustrate this, Brooklyn Bridge is floored with spruce each year, this one quality outweighing its other disadvantages. It will interest readers to know that it takes about half a million feet 2 x 10 x 16 feet 6 inches to floor the bridge.

In frame buildings, especially in New England and Quebec, large quantities of spruce are used for clapboarding and novelty siding, and it is found quite satisfactory when properly painted. In Ontario the use is not so general, but is becoming more so, with equally good results. For inside natural wood finish for offices, etc., clear spruce is very attractive.

One other use of spruce in construction work is its peculiar fitness for scaffold plank and temporary flooring for buildings under construction. Its strength, lightness and wearing properties make it preferable to any other wood. The planks have not the objectionable splintering found in hemlock and some other woods. New York City each year consumes millions of feet of 1¼ and 2 x 9 x 13 plank for these purposes, which comes largely from the Ottawa Valley and other parts of Quebec, and is transported during the season of navigation by canal boats. The Woolworth Building in New York—55 storeys high—now under construction, will use 600,000 feet 2 x 9 x 13 for scaffolding and temporary flooring.

Passing from construction to other uses of spruce, Mr. Campbell said that manufacturers using boxes and crates find spruce cheaper, more durable and less easily wrecked than other woods.

In discussing lumber values Mr. Campbell had a word of praise for the manner in which the "Canada Lumberman" has upheld Canadian woods against the competition of Southern pine. All the arguments are in favor of Canadian woods—spruce, pine and hemlock—and still there are architects and contractors who for some inexplicable reason persist in specifying Southern pine for structural work, interior decorative work, joisting, etc. The price of the Southern pine is greater and its inflammability is a source of danger. An American architect might be excused for making this mistake, as he may not be familiar with the merits of Canadian woods, but a Canadian architect should know better.

Arthur H. Campbell—Managing-Director

Organization of The Company

The Campbell-MacLaurin Lumber Company was organized in 1907 under a Dominion Charter to carry on a general lumber business. From the outset a large part of the Company's business was the handling of spruce, and the conviction of the Managing Director, Mr. Arthur H. Campbell, that there was a great field for enlarged operations in the sale and use of

Geo. L. Ryon

De Witt C. Culver

Maurice Welsh

spruce, has been fully justified by the growth of the company's business from year to year. As already stated, the company does not confine its operations to spruce exclusively, but spruce plays such an important part in the output of the company that "Everything in Spruce" is recognized as its commercial slogan. The great bulk of the sales are spruce lumber, rough and dressed. Other kinds of wood, however, are largely handled, the preference being for "the particular wood that will suit the special purpose, even if a campaign of education is necessary to introduce it." They handle a large quantity of cedar shingles and are the sole agents for Ontario for Donald Fraser & Sons' New Brunswick cedar shingles, well known to the trade throughout Canada and the Eastern States.

When the company decided to build their mill after looking over the whole field, it was decided that Drummondville, Que., offered special inducements in location, transportation facilities and local advantages, consequently the mill was built in 1908. The Canadian Pacific Railway and Intercolonial Railway connecting with the Grand Trunk Railway, afford transportation facilities. The mill and equipment throughout are modern in every particular, with every facility for handling and dressing lumber quickly and cheaply. The machinery is of the latest and most advanced type. Berlin matchers and surfacers and Mershon's band saws are used. The motive power is supplied by Robb engine and boilers which are located 12 feet from the mill in an absolutely fireproof engine room having cement floor, brick walls and iron girders and roof. This construction with good fire appliances secures for the company a very low rate of insurance.

In securing a site the company bought a large space of ground to give sufficient yard room and building room to meet the requirements of years to come. The illustration at the head of the page shows that a considerable area is required for the stock carried.

The company's principal sales are made in New York City and State, the New England States, Ontario and Quebec. Since its organization the business has increased from year to year at a very rapid rate, and the success in the past augurs well for greatly increased success in the future.

In October, 1910, the company suffered a loss in the death of its Vice-President, Mr. Jas. D. McLaurin, treasurer of the Skillings, Whitneys and Barnes Lumber Co. It was largely through Mr. McLaurin's initiative and energy that the company was organized. He gave substantial encouragement to the enterprise and his unbounded enthusiasm helped to give the company its first impetus. Wherever Mr. McLaurin was known, and his circle of acquaintances was a very large one, he was extremely popular and will be long remembered for the encouragement and support he gave to young men beginning business. Mr. McLaurin was also associated with a number of large lumber companies in Canada and the United States.

DIRECTORS AND MANAGERS

The Board of Directors and Managers is as follows: Alexander L. MacLaurin, president; DeWitt C. Culver, vice-president; Arthur H. Campbell, managing director; George L. Ryon, director; Maurice Welsh, director and Ontario manager; Wm. J. W. Booth, cashier. E. D. McCallum, manager at Drummondville; E. L. Simard, Quebec representative; M. H. Gatchel, New York representative. The personnel of the Board makes it a remarkably strong one, as each member is well known in lumbering, commercial and financial circles.

Alex. L. MacLaurin—President

Mr. MacLaurin is a lumberman and the son of a lumberman. His father was Mr. John MacLaurin, who lived at East Templeton, Ottawa County, Quebec. Mr. MacLaurin received his education at the old Ottawa Grammar School. In 1868 he joined his father's lumber business at East Templeton, becoming a partner in 1878 by buying out the interest of Mr. Blackburn, the former partner. He retained his connection with the firm until 1886, when he went to Montreal, and with Mr. Robert Reford and others organized the Charlemagne and Lac Oureau Lumber Co., with mills at Charlemagne and Montcalm. In 1905 Mr. MacLaurin assumed the management of the Canadian mills of the Union Bag and Paper Company, comprising the Charlemagne and Lac Oureau Lumber Company, The Gres Falls Company and the St. Gabriel Lumber Company. Upon the organization of the Campbell MacLaurin Co. in 1907 he was made president. He is also associated with other companies in the following capacity: President British Columbia Timbers, Limited; President Quebec Timber Limit Holder's Association; President Laval Electric Company; Canadian Director, Yorkshire Insurance Co.; Director Maritime Coal, Railway and Power Co.; President Canada Electric Co. and President MacLaurin Bros., Limited, the well known lumber company of Montreal.

Arthur H. Campbell—Managing-Director

Mr. Campbell has three special qualifications as the responsible head of a large lumbering enterprise. He is a young man, he has a thorough knowledge of the lumber business and he is a lumber enthusiast. Mr. Campbell is a son of Mr. Paul Campbell, formerly of the firm of John Macdonald & Co., of Toronto. He was born in Toronto in 1874, and educated at Upper Canada College and Toronto University. During his two years at Varsity Mr. Campbell somewhat cheerfully admits that he distinguished himself more on the campus than in the class-room. He was Captain of the Varsity baseball team, and half-back on the rugby football team which won the championship of Canada in 1895.

After leaving Varsity, Mr. Campbell joined the staff of W. C. Edwards & Company at Rockland, where he received his initiation into the multiplex mysteries and problems of the lumber business. To the training received with the Edwards Company, Mr. Campbell attributes much of his success. He has great appreciation for Senator Edwards, whose methods and principles he has tried to apply to his own business. After spending some time at Rockland and Ottawa, he became salesman for the Robinson-Edwards Lumber Company and was made New York manager of this company, remaining there 10 years, during which time he established a large connection, so that when he left New York to organize the Campbell-MacLaurin Lumber Company, he was well known to the trade in New York City and State, in which places a very large proportion of the company's business is done.

Mr. Campbell has been successful in securing men of high standing and exceptional ability as salesmen and representatives. All who are identified with the company are men who have been

Wm. J. W. Booth

E. D. McCallum

M. H. Gatchel

E. L. Simard

associated with lumbering and lumber enterprises from the well known president to the latest addition to the selling ranks.

DeWitt C. Culver—Vice-President

Mr. Culver has been identified with the lumber business since 1886, when he began as travelling salesman. He has been associated with the Superior Lumber Company of Buffalo, and with the Skillings, Whitneys and Barnes Lumber Company, of Ogdensburg, of which company he is now general manager. He is also a director of the Strong Lumber Company of Orillia, George Gordon & Company of Cache Bay, Bartlett Lumber Company of Sheldrake, Michigan, and the Marine Transportation Company of Ogdensburg.

George L. Ryon—Director

Mr. Ryon entered the employ of the Skillings, Whitneys & Barnes Lumber Company of Ogdensburg, N. Y., in 1872 as a clerk. By sheer ability he worked his way through the gradations of cashier, book-keeper, and assistant-treasurer, until he is now treasurer of this corporation.

Maurice Welsh, Director and Ontario Manager

Mr. Welsh was born in Bobcaygeon, Ont., which Mr. Welsh states, is "the home of the good, the true and the beautiful." With a combination of these virtues and others of a more practical and commercial character, he makes a successful representative in the Ontario field. He was first associated with the well known and old established firm of the Mossom Boyd Lumber Company of Bobcaygeon. Upon completion of this company's operations in Bobcaygeon Mr. Welsh joined the Campbell MacLaurin Company as their Ontario representative in 1907.

Wm. J. W. Booth—Cashier

Mr. Booth was engaged in the lumber business with James Booth & Company, Dublin, Ireland, and came to Canada in 1904, joining the office staff of MacLaurin Bros., Limited. He became cashier for the Campbell MacLaurin Lumber Co., Limited, in 1907.

E. D. McCallum, Local Manager at Drummondville

Mr. McCallum was formerly associated with the Charlemagne Lumber Company at Charlemagne, and the York Lumber Company, at Gaspe. At the beginning of the company's operations at Drummondville, Mr. McCallum was put in charge and he has shown exceptional ability as manager. His relations with the employees and the public generally have been most pleasant.

Mr. Maurice H. Gatchel, New York Representative

Mr. Gatchel had his earliest experiences in lumbering with Mr. Thomas W. Smith, a prominent lumberman of Washington, D.C., whose employ he entered when 16 years of age. After 10 years' experience as secretary, inspector and yard manager, he removed to New York to represent W. M. Crombie & Company as salesman of Southern pine and Pacific Coast products. He remained with this company until he became representative of the Campbell MacLaurin Company in New York, in 1910.

E. L. Simard—Quebec Representative

Mr. Simard, like many another practical lumberman, got his first experience in lumbering with the Charlemagne Lumber Company. Subsequently he joined the staff of the McLean Company at Bonaventure, Que., and remained with that company until he became travelling salesman in Quebec for the Campbell MacLaurin Lumber Company.

Forest Surveys—What They Cost

By C. A. Lyford

The cost of a forest survey varies with the intensity of the methods used in collecting and working up the data. The cost of any survey should be proportioned to the value of the property surveyed. The intensity of method may generally be so adjusted as to make the total cost of survey approximate one per cent. of the stumpage value of the merchantable timber. This proportion should never exceed two per cent. and should rarely be less than one per cent.

Both cost and methods depend somewhat on local conditions. The cost not only varies with the intensity of method, but is also influenced by such factors as accessibility, compactness of area, presence or absence of initial base lines, prevalence of windfall, etc. Weather also plays a part in the cost occasionally, when the need for results is so urgent that the work must be prosecuted under unfavorable conditions, such as those occasioned by the Spring "break-up" in the Laurentian region of Eastern Canada.

The heavy stands of fir and cedar on the Pacific Coast, call for a survey costing on the average about $150 per square mile. Such a survey involves: A system of base lines carefully chained and leveled and not over one mile apart, on which are tied a system of parallel cruise lines not over 10 chains (⅛ mile) apart; additional cruise lines wherever they are needed to insure accuracy of detail; a complete and detailed tally of all timber on a strip one chain (66 feet) wide along all cruise lines; the accurate location between cruise lines of the boundaries between the various kinds and qualities of timber; complete levels along all cruise lines; careful leveling of all important water-courses; all to be worked up into maps, tables, and reports, the effectiveness of which can best be appreciated by examining samples of the finished results of such a survey.

For the pulpwood region of Eastern Canada and Northeastern United States, where the stand is light and the value per square mile correspondingly low, methods have been developed whereby an essentially complete forest survey may be made for from $30 to $40 per square mile. Such a survey is less accurate as to details than more expensive systems, the spacing of the cruise lines being 1-3 of a mile, but the data is made sufficiently complete to permit the preparation of reliable contour maps on a scale of 4 inches to a mile, with the various forest types and conditions shown according to a regular map legend. The timber estimate data is assembled by drainage units of 10 to 20 square miles each, and worked up into tables showing the amount of timber classified according to kind, size, and quality.

For cheaper surveys, some of the essential features of a complete survey have to be omitted. By dropping the contours and the detailed mapping of lakes and streams, the cost may be reduced to $25 per square mile, with a further reduction to $20 by increasing the spacing of the cruise lines to ½ mile, or to $12 by increasing the spacing of the cruise lines to 1 mile.

Sanding Fine Furniture Stock

Requires a sander with adjustments easily and quickly made, and with all operating parts so simple in construction that keeping them in perfect alignment does not require expert attention. Every working part has been simplified for this reason on

Berlin Triple Drum Sanders

No other sander has carried this idea so far as the Berlin, because no other builder recognizes that simple adjustments increase the efficiency of a machine.

Ask for Sander Booklet

Take the Drum Adjustment for instance. Each Berlin Sander Drum may be adjusted separately or all of them simultaneously by means of the same hand wheel. Thus drum adjustment is made far more accurately and in less time, than where there are three hand wheels necessary.

With the one handwheel all drums may be raised equally at the same time, then the separate drums properly adjust for correct proportion of the cutting. With three separate hand-wheels all adjustment is a matter of guess work until several pieces are run through to test the setting of the drums.

Even if a new operator were to make poor adjustments of the drums, good stock need not be ruined by taking too deep a cut. He has the reverse at hand to back out the stock. This same lever starts and stops the feed instantly. No other sander built has this feature.

Another exclusive feature of the Berlin is the feed control lever. With this lever three changes of feed speed are obtained as well as starting and stopping. Feed changes on other sanders are made by changing pulley sizes for the different speeds.

Adjustment of feed rolls, press rolls and drums for aligning are simple and quick. It requires only the loosening of set screws and turning up or down the bearing screws to secure perfect alignment. Moreover once aligned they remain so.

No sander part receives harder wear than the oscillators; but this is easily taken care of on the Berlin. The adjustment collars are kept in place by set screws. If any wear occurs in the oscillator box a set screw is loosened and the collar turned so that all lost motion is taken up. No other oscillator part requires adjustment. The oscillator box is cup shaped and will retain oil up to the shaft bottom. Better investigate further.

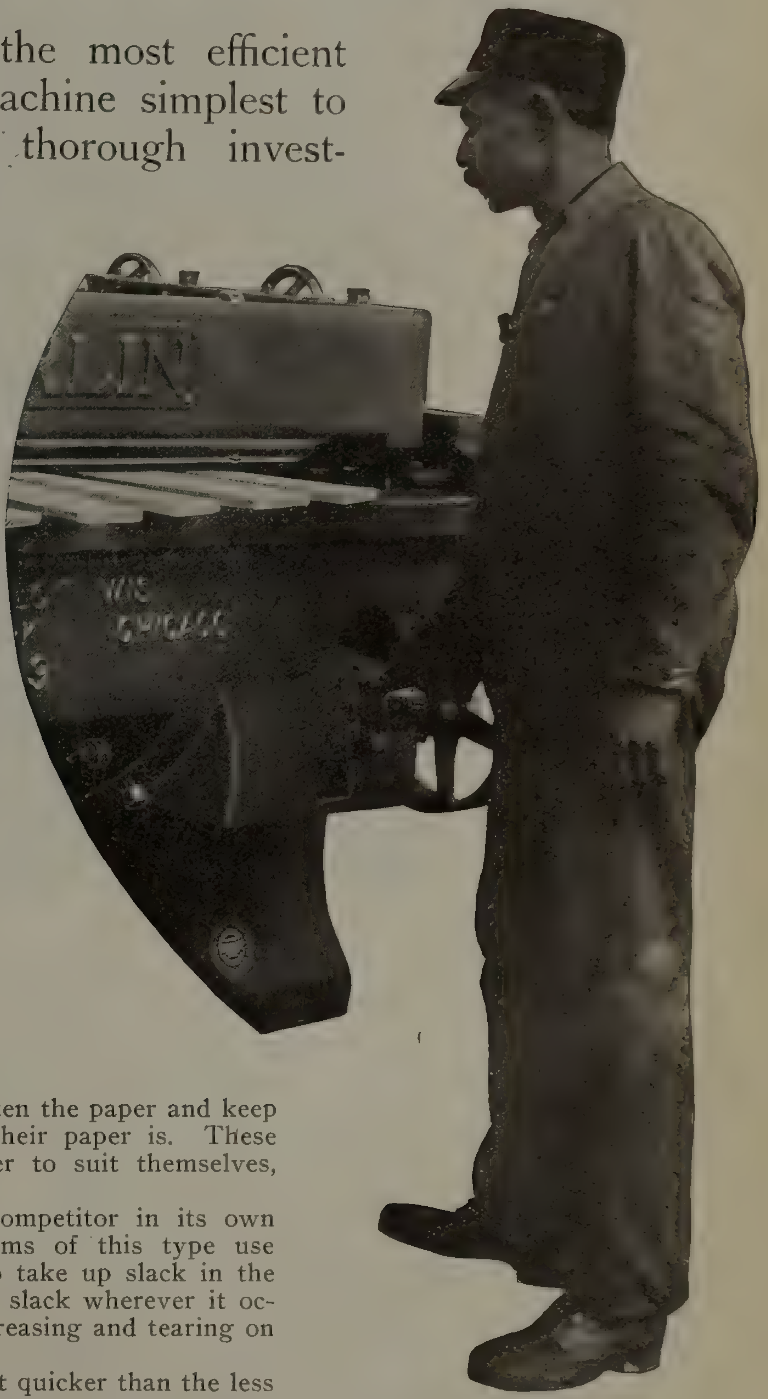
Operators Should Choose Sanders

Given the chance, operators will choose the most efficient sander, because an operator prefers the machine simplest to operate with drums easiest to cover. After thorough investigation he would like and recommend



Berlin Triple Drum Sanders

One operator may prefer the **spiral** type of drum, another the automatic take-up. He may choose either on the Berlin.

SEND FOR SANDER BOOK

The Berlin spiral drum is well known for its very effective sanding and polishing abilities. Paper is wound about it spirally with edges lapping so that there is no break in the cutting surface. A groove is made in the drum shell and covering to allow of lapping edges without a ridge. Under average conditions this drum is the most efficient built.

The spiral drum does not depend upon automatic means to tighten the paper and keep all slack out of it. Many operators prefer to know just how tight their paper is. These men get better results with the spiral because they tighten the paper to suit themselves, after which no slack occurs.

The Berlin automatic take-up straight opening drum has no competitor in its own type, because of the flexibility of the take-up device. All other drums of this type use straight bars across the drum to clutch the paper, so that in order to take up slack in the paper it must be loose all over. The Berlin flexible device takes up slack wherever it occurs in the length of the drum. No danger of paper folding over, creasing and tearing on this drum.

Paper may be put on either of these Berlin drums as quick if not quicker than the less efficient drums offered by would-be imitators. Another thing—Berlin drums are balanced perfectly. The straight opening drum as well as the spiral is balanced in running condition and cannot be thrown out of balance.

There's a 32-page booklet on Berlin Sanders that all operators and superintendents should have. Send for it at once. It's free and full of information.

Lumber Trade in United Kingdom

Written for the **Canada Lumberman** by James Hammer Quail

Business in lumber at the principal timber ports of the United Kingdom shows widely different degrees of activity at the present time. At some ports business is brisk, and in extent is satisfactory. At other ports business in lumber generally is quiet, and the output from yards for consumption is on a small scale, though in these cases some woods, such as birch, oak or pit-wood, is moving quite satisfactorily. This last is the condition of things at London. Sales of pine and spruce lumber for home uses have been on a small scale, but some life has come through the export branch. Buyers on the Continent have made very fair demands and these have maintained a degree of life at offices and wharves which has been of importance to the trade, as keeping things moving for the time being, and as affording fresh evidence that consumers on the Continent are still in active business touch with London merchants and are ready and willing to take timber from them. This continental connection is standing London merchants in good stead at the present time, and is causing a movement of timber which, though not large, is gratifying to those who receive orders to supply.

A very fair number of inquiries have come in for goods to be delivered early in 1912, and some desirable orders have been booked for these forward deliveries. This, apart from price, has been satisfactory as far as it has gone, as it has meant so much trade to the good for next year, but the trade has not yet been visible in yards and on wharves, for no stock has been moved yet in respect of it. It is all "book" business. The yards will deal with it at any time within the next six months. Merchants are glad of this forward business none the less. As aforesaid, it is so much to the good for next year, and that is a matter for satisfaction.

So far as the doings in the sale-rooms afford an index to the stock of the timber trade in the London district, there is little cause for complaint. The timber offered has found ready buyers, but the prices obtained, in the case of spruce and pine lumber have not been high, showing that there has not been an urgent need to buy on the part of those bidding for the different lots. This easing of competition in the sale-rooms is one of the most accurate indications of the state of trade to be found in London. If consumption is brisk and yard stocks have been worked down, the desire to replenish is strong, and competition in the rooms becomes keen. If consumption is slow and stocks are fairly full there is no such desire to buy. If useful stuff can be bought at "a price," then someone present will think it worth his while to take the lot or lots at the price, and the timber will be sold. The state of the competition will be an accurate mirroring of the state of trade in the principal fields of consumption. At the recent sales the state of the competition has indicated quietness in some of those fields. In that of the building industry, the most important of all, things have become very quiet in the London district. The writer, in the course of a run through the garden-city districts of North London, at the middle of November, was able to note how very little building work was actually in progress. Much property letting at £3 to £50 per year had lately been completed and had become tenanted, but of building actually in progress, there was little. This was but the ordinary condition of things for the time of year, as every effort is made by builders to get new property finished and tenanted before the winter rains fall or frosts come. Building in London may be said to be stopped for the winter. It does not follow, however, that the production of builders' joinery must stop when the building trade closes itself down for the winter months. Much projected building work is so completely "in plan" long before the constructional work of the lower parts is completed, that the joinery work can be pushed on, the joiners working "to plan" and to "scale." In this way, much joinery work can be put in hand and finished before it is wanted to be fixed in position. But in the London district work on builders' joinery is now quiet. Packing case makers continue very busy, the near approach of Christmas having increased the demand for cases. The sale of timber for case-making is fairly active, but the business done is largely in spruce boards of ½-in., ¾-in. and 1-in. nominal. Cabinet woods are also in good demand, especially mahogany, walnut, birch and oak, in hard wood, and yellow pine, in soft-wood.

At Liverpool, business is proceeding on the improved scale last reported. The spot demand for soft-wood lumber is good. Orders for spruce are coming in satisfactorily as regards number, though most of them are not for large quantities, and suggest that buying is proceeding on a hand-to-mouth scale. The values of spruce keep firm and the tone of the market is good. Builders are fairly busy so that a very fair demand for builders' timber exists. Pitch pine lumber is in good demand and values are very firm. Birch is in fairly active demand, and is firm in price. Stocks of planks are light, but those of logs are fully up to the average. Stocks of Canadian oak are light and the consumption is on a satisfactory scale. Planks are in moderate compass and the consumption is active.

At Manchester the timber trade is now deriving benefit from the active and flourishing condition of the cotton trade, the general engineering trade, the woollen trade, the coal trade and the ship-building trade of Lancashire, Yorkshire, Durham and Northumberland. Since the close of the great strikes, in August, the trades named have become very active. The activity is making a good demand for timber at Manchester, and has caused the outlook for the trade for the winter to be bright and full of promise. Red and yellow pine and spruce, in boards and deals of practically all useful sizes, meet with a ready sale. Much of the timber is taken at once, for use, on arrival.

On the northeast coast business in the timber trade is now fairly satisfactory. At West Hartlepool lumber is in active demand. The shipyards are maintaining a demand for whitewood battens and deals, while the case-makers of the district are busy, and are taking fairly large quantities of white wood and red-wood of the cheaper kinds for their own uses. Orders for sawn pitch-pine have come in more freely, while the demand for pit-wood, deals, and light log-stuff, from the collieries has increased materially. Much business has been done for deliveries in the first half of 1912.

At Hull the condition of the timber trade is almost exactly similar to that at Hartlepool. New orders from the northern districts served by Hull, are coming in freely and the sawmills are busily occupied. All branches of the timber trade may now be described as busy.

At Glasgow the consumption of some kinds of timber is active, while other kinds move less freely. Yellow pine is in good and improved demand, especially the higher grades of the wood. Spruce has lately been very quiet. Pitch-pine has been in fairly good demand. Oak, elm, teak and waney pine have also sold steadily.

Coronation Timber

It was mentioned in the Canada Lumberman at the time of the Coronation of King George V. that a large part of the timber used for numerous stands for sightseers along the royal routes would most likely find its way back again into the hands of members of the timber trade. It is now announced that Messrs. Thomas Jones, Limited, of Bermondsey, London S., have purchased from the police the timber used at the time of the Coronation for barricades in the public streets. As special "lots" in the purchase have been mentioned, 480 pitch pine posts, 9-in. by 9-in. and some fifty standards of rough boards. Much of the timber used for the stands, chiefly small log stuff, planks, scantling and boards, found its way back to one branch of the timber trade or another, and will have passed ordinarily into consumption.

The Cutting of Prices

The very keen competition in the timber trade at London, at Liverpool and Manchester, is now the chief topic of the trade. Taking the country as a whole much business in timber is being done, but the complaint is that prices are cut so fine that much of the business is not worth doing. In proof of this one hears of sales in which the profit will only work out at 10s., 7s. 6d., 5s., or even 2s. 6d. per standard. It is probable that very few transactions will take place which leave so lean a profit as 2s. 6d. per standard to the seller, but even the higher prices named are sadly inadequate and carry no margin which will provide against the ordinary risks of trade. One can understand an eagerness to do business and a measure of keenness in the doing of it, but one can not understand the selling of goods at cost, or practically so, which the selling of timber at prices now being mentioned, really means. The proverbial changing of a shilling, to oblige a friend or neighbor, is all very well, but it is not business, and the selling of goods at cost price is similarly not business. The irritating element of the case is that there is really no need for the cutting of prices which is now going on. Prices which carry a moderate profit can be obtained as easily as the "cut" prices. Buyers would as readily pay fair higher prices as the low "cut" prices. The quoting of an unfairly low price to secure an order is an obtrusion at one's own cost. A seller "A" may secure an order which would otherwise have gone to another seller, "B," by "undercutting" him, as it is termed, that is, by quoting a price which is unfairly low. In such case B will have lost an item of profit, but A will have gained little, if anything, and that little will be an unfair profit. This again is not business. Boycotting and denunciations of traders who offend in this way have proved futile in cases of the kind. The remedy lies in commonsense and honorable procedure all round. This may come through an allround recognition that the distributor as a worker, is worthy of his hire in the form of a fair profit on the goods which he handles and sells, and that to trade on a principle which means the throwing away of such fair profit to the injury of oneself and of one's fellow traders, is neither good business nor sound business morality. It is, indeed, a form of business prodigality and meanness which deserves no place or toleration in the practices of a reputable trade.

THE HOME OF ATKINS STERLING SAWS, HAMILTON, ONT.

E. C. Atkins & Company Open New Branch at Vancouver

The latest addition to the Canadian Department of E. C. Atkins & Company is the branch which has just been opened at Vancouver, B. C. The wonderful development of the company's interests in Western Canada rendered it imperative to establish a selling and distributing depot for the Canadian factory at Hamilton.

The new Vancouver branch is in charge of Mr. W. C. Birdsall, Manager of Sales. Every lumberman and hardware man throughout British Columbia knows "Bird" and likes him. Mr. F. R. Arnett, well known in this section and for some years associated with the company in the States, will assist Mr. Birdsall as Office Manager.

The new branch is located in the brand new store building at No. 109 Powell street, which is in the heart of the business district of Vancouver. The building is 25 x 100 feet and is six storeys high, with a basement. It is thoroughly modern in every particular, well lighted and admirably adapted for the company's use. The ground floor is fitted as a sales and office room with private offices and social rooms for visiting customers. A large display window and vestibule entrance furnishes an opportunity of showing constantly the various types and styles of saws and tools which the company make. The upper floors accommodate the duplicate stock of all kinds of saws and tools, thus giving the customer the benefit of prompt delivery at the lowest possible transportation expenses.

A very complete repair shop has been installed under the personal supervision of experts which have been sent direct from the factory. These men have been selected on account of their long and varied experience in the scientific manipulation of saws. All kinds of re-fitting such as cutting down, re-toothing, gumming, re-tempering, hammering, filing, etc., will be done in the most painstaking and effective manner. This will be greatly appreciated by all mills throughout this territory, as it gives them the opportunity of securing the most expert and painstaking service.

The company has provided an adequate sales force and several mill, cross-cut and hand saw specialists will travel from the Vancouver branch, covering thoroughly all of British Columbia and as far east as Calgary.

The almost limitless supply of timber on the Western coast of Canada, together with the remarkable development of the business interests in that section undoubtedly insure for the Vancouver branch a prosperous future.

The high quality of Atkins Sterling Saws (which is the brand under which these saws are known in Canada) will enable the Canadian manufacturers to secure the very finest saws that the market affords, without delay and at the least possible cost commensurate with quality.

The entire Canadian business is under the direct management of Mr. H. P. Hubbard, with headquarters at Hamilton.

In 1910 Canada exported to Great Britain 2,965 logs and 37,454 tons of square timber. The square timber had a value of $907,759, as compared with $1,485,190 in 1908. The exports of deal amounted to $7,715,442. The total forest products shipped to Great Britain amounted to $11,033,074, as against a total of $31,835,326 to the United States. The largest item shipped to the United States was planks and boards, which in 1910 amounted to over $17,000,000. There was a slight falling off in the export of shingles in 1910 to the United States.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Basswood, Elm and Maple

Wanted—a quantity of one and two-inch basswood, elm and maple. R. W. Baxter, Chatham, Ont. 24-1

Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

Spruce Wanted

We can use short spruce 4-4 and 5-4. Describe what you have to offer and lowest price delivered here. The Rathbun Company, Deseronto, Ont. 21-24

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Wanted

500,000 feet 4 in., 4½ in. and 5 in. Birch Firsts and Seconds for shipment as soon as sawn, green or dry. Quote best price on cars, giving amounts you can furnish. Box 353, Canada Lumberman, Toronto, Ont. 22-5

Wanted

WANTED—Birch, maple and poplar logs, No. 1 butt cuts. Delivered Montreal from March to May, 1912. State sizes and lowest cash price to E. T. H., B34, Board of Trade, Montreal. 24-24

Lumber Wanted

1 in., 1½ in. and 2 in. Black Ash; 1 in. to 4 in. Hard Maple; 1 in. and 1½ in. Soft Maple.
1 in. to 2 in. Basswood; 1 in. to 3 in. Soft Elm, and 1 in. to 4 in. Birch.

Send particulars to James Lauder, 501 Kent Building, Toronto.

Wanted

Five million feet of maple, birch, basswood, ash, oak and elm, 1-in. to 4-in. thick, for delivery during 1912 at Owen Sound, water shipment only. Can use log run. Advise what you have to offer, giving lowest prices. Our terms are spot cash on delivery. Box 388, Canada Lumberman, Toronto, Ont. 24-3

Wanted—Box Lumber

Large consumer of No. 1 and No. 2 White Pine Box Lumber, desires to negotiate with responsible shippers, regarding stock for water delivery next season. Give shipping point, state quantity 4-4 and 5-4 can furnish with lowest quotations and other particulars.

Address, Box 374, Canada Lumberman, Toronto, Ont. 23-2

Wanted

Ten cars 1 in. and 1½ in. Dry Soft Elm, log run. Apply Box 370, Canada Lumberman, Toronto, Ont. 23-2

Wanted

two carloads 4-inch firsts and seconds, Hard Maple, dry, 6 inches and up wide, 10 ft. and up long, for immediate shipment. Quote price and point of shipment to Box 360, Canada Lumberman, Toronto. Ont. 22-tf

White Pine Logs Wanted

Wanted, sound, green, white pine logs (small second growth preferred) for immediate or winter delivery. State what quantity, where they are, and price by piece or by the thousand. Write The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 22-1

Birch Wanted

We want to buy Birch in all thicknesses. Log run or on grades. Will contract for winter's cut. National Lumber Company, Buffalo, N. Y. 23-2

Maple and Rock Elm Wanted

Wanted—Up to 120,000 feet 1-in. and 1½ in. hard maple 6 in. up wide, 10 ft. up long; also 20,000 feet 1-in. and 1½-in. rock elm 6-in. up wide, 10 ft. up long; quote price for 1sts and 2nds and also No. 1 Common grades in each case and name point of shipment to Box 382, Canada Lumberman, Toronto, Ont. 24-tf

FOR SALE—LUMBER, ETC.

Cedar For Sale

Square Cedar for sale; 1,000,000 to 2,000,000 feet, for next winter and spring delivery. Auger & Son, Quebec, Que. 22-1

For Sale

Pine—30 million feet estimated, close to Georgian Bay. Can be operated and driven at low cost. For particulars apply The Ontario Lumber Company, Limited, 20 Dowling avenue, Toronto, Ont. 23-24

12 in. x 12 in. For Sale

300,000 feet B.M. of 12-in. x 12-in. short leaf yellow pine timbers 18 ft. to 40 ft., average 30 feet. Can ship immediately.

JAMES SHEPPARD & SON,

I have a Newfoundland limit for sale about one hundred square miles, well watered and close to railway; price moderate; chiefly spruce and pine. Write B. T. R., care Canada Lumberman, B34 Board of Trade Bldg., Montreal, Que. 22-1

Forest Fire Lookouts

Uncle Sam has taken to building lighthouses in his forests. Having marked his coast line for the benefit of mariners, he is marking his inland wooded ways for the benefit of civilization.

He intends to construct on the western mountains permanent stations from which keen-eyed guards may watch the surrounding country for the first glimpse of forest fires which have resulted in so much damage to life and property during the past few years.

Lookouts have been kept in the national forests for a long time to protect the five hundred odd millions of government acres.

A few towers already have been erected during the summer. But henceforth they will be placed in every national forest and where demonstrations show they are needed.

Moreover, the forest service is clearing the fire lines, building trails and introducing the heliograph, in order to pass word from peak to peak.

Forestry officials have learned much from destructive fires in the northwest.

Each line of work demands study and the value of fire lookout stations as a protection is being tried. Where the topography affords vantage points from which large areas can be seen and the air is clear lookout stations can be established of value.

Experience has shown that where fires are discovered at their inception small damage is done. But the forests must be made accessible by trails and means of discovery and accurate direction must be provided. This is where the lookout stations come in.

This is the plan: A watcher on one peak has a map of the territory, with lines two degrees apart radiating from the center.

Another watcher on a distant peak has a like map. When a fire is seen they level their telescopes in the direction of the fire. Each then calls the forest supervisor, and he by means of two maps similar locates the fire.

Generally speaking the lookout points will not be above timber line. The country which must be seen is too far below a high peak to be seen in detail.

Until the value of a site has been demonstrated it will be equipped only temporarily. The observer lives in a tent. His equipment consists of a telephone, a field glass, a compass, detailed maps, a drafting outfit and notebooks. Where the building of a telephone line presents unusual difficulties a system of signals is used instead. In some places regular army heliographs are installed.

In veneering onto solid wood, in making mantels, etc., it is possible to have the lumber too dry, so that when it absorbs moisture it will swell some and the veneer face will crack. Sometimes people, in their anxiety to have the lumber dry, make the mistake of overdoing it. Old veneer men say that lumber having been dried, should be allowed to temper in the open atmosphere for a week at least, before being used as a body for veneer.

Belt dressing is a good thing in its way if properly handled, and it can be used to advantage in most shops, but to see some fellow keeping the road hot to the dressing can and doping his belt with it until it is practically ruined, when a few minutes' work with the lacing tools would set the matter right, is annoying to say the least. Of course there are belt dressings and belt dressings, good, bad and indifferent, many of which if used very long will ruin any belt, but if a good dressing is kept on hand and used moderately it will be found beneficial.

Review of Current Trade Conditions

Ontario

With the holiday season at hand it is hardly to be expected that there would be any sensational developments in the trade. At this season of the year most of the retail men and consumers are too busy taking stock to think about buying, and everywhere orders are reported few. Under these considerations and comparing the volume of trade with that experienced at similar periods of previous years, there is no cause for dissatisfaction. The leading lines are featureless except that the demand in Norway pine is well maintained. There is the slightest tendency to better prices in hemlock and spruce, but no material advances may be expected at present.

In the hardwood trade things are a little better and conditions generally are reported good. Birch and maple are about the firmest in the line. While prices are well maintained on the other side of the border and payments are good, orders are by no means plentiful. Early inquiries for birch and maple have come from the U. S. Implement manufacturers in Canada have been buying freely in anticipation of a shortage. Basswood is stronger and elm is well sustained; oak is fairly quiet. As for ash, there is practically none to be had: stocks are reported exhausted.

Eastern Canada

From reports received from various sections, it would seem that there is a general feeling that the year has been a good one with lumbermen in this part of the country and that the amount of business being transacted at the present time is at least up to normal. Great things are expected of 1912, it being generally believed that next year will be the greatest ever in Canadian building history. There is particular activity promising at Montreal where announcements concerning big construction projects are made almost daily. This, of course, is not without a well defined effect upon the lumber industry and the demand in many lines is improving. At Montreal, hardwoods are making a good showing, chestnut and plain oak being the brightest spots. In some quarters quite a rush of business is reported. The small offerings of shingles are resulting in somewhat better prices. Spruce lath sells readily. Little demand for dimension timber is experienced.

Logging operations in New Brunswick show an improvement upon previous years. Prices in Fredericton and St. John include: spruce scantling random lengths, $16 to $17; spruce boards $16 to $17; hemlock boards $15 to $15.50; shingles $1.30 to $3.00. A better demand for the cheaper grades is reported from this section. Hardwood prices have advanced slightly.

From New York a quiet demand but fewer offerings are reported in spruce; in fact, spruce supplies are much lower than they have been for a number of years at this season. The small buying on the part of the yards is attributable, doubtless, to the rather unsatisfactory building situation. Hemlock continues in fair demand. Retail supplies are limited and mill stocks are not heavy. A uniformly good demand for hardwoods continues to come from manufacturers, —an indication that the consumers' supplies are working down pretty low and that there is need of stocking up.

Boston has sufficient demand for spruce to keep prices firm. $24 is asked for frames, the high figure reported being $24.50. Random is held firmly with a fair number of enquiries. Covering boards are at an average trade. Hemlock is about holding its own. Shingles continue strong. The best cedars sell from $3.50 to $3.60. The low price for clears is $3.20. The lath trade is quiet.

Great Britain

Reports generally indicate a fairly satisfactory volume of business. Imports, however, are on still quite moderate lines. Dock deliveries at London have been small. Bad weather has had its effect upon business in the Metropolis, but the trade shows some tendency to improvement. The outlook is rather better than it was and there may be more disposition to deal with business other than such as is connected with the immediate present. For the most part stocks are light and assuming that trade goes on improving a good deal more wood than usual will be required for the consumption of this country.

At Liverpool, the trade in softwoods continues fair but the volume of business done is not altogether representative and greater activity may be anticipated. The spot demand recently has been fairly active. In some directions stocks are thinning out and will need to be replenished shortly with fresh purchases. Spruce values are firm and the difficulty of obtaining steamer-room, with the consequent shortage in the import, and the high rates quoted, will keep the market steady. Birch planks meet with a ready sale and higher figures are the tendency. The Canadian season for shipments of pine goods from Montreal is now closed and the arrivals by the "Megantic" recently were practically the last.

At Manchester, orders and enquiries are up to about their usual average for this time of the year. Spruce deals continue firm and stock-holders show no disposition to force sales. Parcels of battens have been offered at £9 5s. ex quay for short average length. The "Manchester Corporation," from Montreal, has discharged numerous parcels of pine, including clear and clear face red pine boards, best pine sidings and strips, u/s. red pine deals, 3rd pine deals and u/s. pine sidings for Watson & Todd, pine sidings, deals, scantlings and ends for J. Wheeldon & Sons, 1st quality pine deal ends and 3rd quality pine deals for J. H. Holme & Co., pine boards for Maddock & Tunaley, pine pickets for J. Robertshaw & Sons, and white pine lumber for Farnworth & Jardine; also 800 doors for J. J. Swan & Co. and maple flooring and flooring blocks for J. Webster & Bro. The Quebec cargo by this vessel has all been taken up by J. H. Holme & Co., consisting of about 250 standards of waney and square pine logs and a small parcel of spruce deals.

Business, on the whole, at Glasgow is looking up. Pine goods are in rather better request, several transactions having occurred of late at firm values, more especially for the higher grades, which are very scarce. Spruce, on the other hand, continues a disappointing market, and sales reported are mostly of a retail character. With the end of the Quebec season it is quite apparent that there is going to be a serious shortage in various staples, such as first pine deals and sidings, waney pine, elm, oak, birch logs, and to a lesser degree in second and third pine, and values on these should meet with a steady appreciation; considerable advances have, in fact, already occurred in most.

United States

While trade generally has shown a tendency to slump in the United States and although the demand for general stock is below the normal, no business is being transacted at give-away prices and there is every reason to hope that better conditions will be forthcoming shortly. Foreign business holds up well and a sufficient number of cargoes are contracted for to be delivered next year to suggest that the oversea trade is to be maintained in volume equal to that of 1911. Further, there are good grounds for belief that the railroad demand will be strengthened next season, in which better figures may be realized early in the New Year. Even as it is, the railroads have been calling for a large amount of material and while it is true that much of this material has been sold at comparatively low prices, nevertheless the demand has been an encouraging feature, opening up a prospect of buying on quite a large scale in the near future. Buying is slow among retailers, the disposition being only to fill present requirements. In some quarters it is thought that this conservative policy will be regretted before long and that the present affords an excellent opportunity to stock up with cheap lumber.

Chicago.—The situation in pine products has improved and the trade is more active than last year at this time. Dealers are holding good pine firmly and in spite of the fact that receipts were large throughout the season, there is a scarcity of high grade pine lumber in this market. A firm tone is also noted in the cheaper grades, this being attributable to a big demand from the box trade. In the hardwood yards, trade is reported good. Wholesalers are doing fairly well and in some cases report active business. There is some speculation as to whether the stocks of lumber on hand will be large enough to meet a heavy year's business. There has been a distinct improvement in yellow pine, the railroads having come into the market for a large amount of material. Stocks of quarter-sawed white oak are still about the same. There is little trade in the upper grades of basswood. The volume of business done in hemlock is comparatively small but satisfactory nevertheless, considering the lateness of the season. What demand there has been has arisen largely from the construction work in the city, of which there has been a fair volume. No change and little demand are reported in shingles and lath; wholesalers, however, evidently expect a higher market during the next month or so. White cedars are selling well. Coopers and dealers report few orders.

Lumber receipts at Chicago for the week ended December 2 were 39,074,000 feet, against 48,249,000 feet for the corresponding week in 1910. Total receipts from January 1 to December 2, 1911, amounted to 1,954,009,000 feet, a decrease of 420,093,000 feet from the corresponding period last year. Shipments of lumber at Chicago for the week ended December 2 were 14,702,000 feet, against 14,928,000 feet for the corresponding week in 1910. Total shipments from January 1 to December 2, 1911, aggregated 736,224,000 feet, a decrease of 175,021,000 feet from the shipments of the correspond-

ing period in 1910. Shipments and receipts of shingles for the week show an increase as compared with the corresponding week in 1910, but total receipts and total shipments of shingles, as compared with corresponding period of 1910, show decreases.

Buffalo.—The comparative activity reported at this city is purely local and, generally, trade is quiet. With the opening of the New Year it is quite likely that there will be a marked revival of business, but at this season buyers hesitate to make any additions to their stocks until they have taken their inventories. The lower grades are firm with some scarcity anticipated. Hardwoods are not altogether without feature. Plain oak prices have been stiffening lately. Maple, birch and ash are moving fairly freely. There is little trade in quartered oak. Low prices and free offerings of hemlock are ruling, the short demand being attributable, of course, to the lateness of the season. Retailers are well stocked with red cedar shingles and the trade in both shingles and lath is comparatively dull.

Bay City and Saginaw.—A fair business was transacted in northern pine last month. Receipts by water have not been as large as last year, but as dealers bring in more or less stock by rail the volume of business will about equal that of a year ago. Dealers here will go out after the holidays and buy stock for next season delivery. The market is generally firm, but buyers expect to secure stocks at a little less than prices of last year. Good pine, however, is now in so few hands that holders of it will easily get good prices. There is a moderate movement in box stuff, sash, doors and other building material.

Market Correspondence

Lumber Conditions at St. John, N. B.

Practically all the mills operating along the St. John River, with the exception of a few at St. John which are still running, have finished sawing for the season. The early formation of ice, due to the unusually low water, caused some of the mills to suspend operations early in November before their supply of logs was exhausted. A few of the mills having shingle stock piled are still sawing, but even these will close down for a few weeks during the severe winter weather in order to overhaul their machinery and get into good shape for the coming season. Mill men men generally report a good local trade with excellent prospects for next summer. The extreme winter weather in this section of the country makes outside work on buildings practically out of the question and little sawn lumber is moving at present. Prices at Fredericton and St. John range about as follows: Spruce scantling, random lengths, $16 to $17; spruce, 2 x 6 and 2 x 7, $16 to $17; spruce, 2 x 8, 3 x 4, 3 x 6, etc., $18 to $19; spruce boards, $16 to $17; hemlock boards, $15 to $15.50; shingles, $1.30 to $3.00.

Little change is to be recorded in the British market, but if anything there is an upward tendency. Hardwood prices have advanced slightly and spruce deals are holding their own. Some improvement is to be noted in the cheaper grades of lumber. The American mill owners on the St. John River are going slowly this winter. The cut of logs will probably be from 20 to 40 per cent. lower than last year. The market for sawn lumber is very quiet. Good prices, however, are offered for special orders.

Logging operations are progressing favorably, the season thus far having been somewhat better than the average.

The Fraser Lumber Company have decided to remove their shingle mill at Edmunston, N.B., to the American side of the river,—the river being the boundary line at that place. The Fraser Lumber Company are among those who experienced considerable disappointment at the defeat of reciprocity.

Good Trade Prospects at Montreal

Montreal, Dec. 12.—One does not expect a great volume of business during the winter, and inquiries indicate that this year is no exception to the rule. For the season, there is a normal amount of trade, with naturally very few features. Occasionally one hears complaints about the falling off of orders, but in the main dealers are satisfied with the volume of business. The past year has been an exceptionally good one, lumbermen having naturally benefitted from the boom in building and the industrial expansion. "If," said one man, "any lumberman in Montreal has made no money during the past twelve months, it is time he got out of the business." Then, too, there is a pretty general feeling that the new year will see another period of good things. Everywhere land is being bought at increasing values, and plans are being made for the erection of many large buildings. Montreal is particularly short of up-to-date office accommodation, and in the downtown section it is intended next year to build a considerable number of big buildings for offices. This all means an increased demand for lumber.

One bright spot is the call for hardwoods, chestnuts and plain oak being in continued demand. One retailer, who does an excellent trade, reports that business was rushing, and that he had experienced no set back so far.

Shingles are looking up, in consequence of the mills in lower Quebec and New Brunswick reducing the output. There is no greater demand, but the smaller quantity available has helped to stiffen prices. Spruce lath is a good market. Dimension timber continues in small request, but better things are looked for when the year turns. The planing mills report that they are fairly busy.

Rubber Goods Factory Extensions

The Goodyear Tire & Rubber Co., of Canada, Limited, have just completed a very large addition to their factory at Bowmanville, Ont. It involved an expense of $170,000, and includes a new 3-storey building, and additional machinery. This will greatly increase their capacity for the manufacture of rubber goods. The difficulty in the past year has been that their previous factory equipment was not sufficient to keep up with the orders which were received. Special machinery for the manufacture of mechanical rubber goods has been installed, being of the last and most modern type. The large hose room is so constructed that there are no posts to obstruct the working of the overhead carriers. The labor question has been a serious one,—due especially to the fact that there was no accommodation for help. It has been decided to build about sixty workingmen's cottages; twenty-six are now under construction, and more will be added as soon as possible.

Pulpwood Consumption During 1910

Nearly six hundred thousand cords of wood were ground into wood-pulp by fifty-one pulpmills operating throughout Canada during 1910. Statistics compiled by the Forestry Branch of the Department of the Interior show that the total value of this wood was three million, five hundred and eighty-five thousand dollars, and that it was converted into four hundred and seventy-five thousand tons of wood-pulp. Quebec is the premier pulpwood province of Canada because of its extensive spruce and balsam forests suitable for pulpwood. The twenty-five pulpmills in Quebec reported the consumption of fifty-seven per cent. of the total for Canada, or twenty-three thousand cords more than in 1909. Ontario likewise increased the amount consumed in its fifteen pulpmills by over twenty thousand cords and used over one-third of the total consumption, forming with Quebec, ninety-two per cent. of the total. The mills of Nova Scotia consumed nearly thirty thousand cords. New Brunswick used barely one-fifth as much as in 1909, contributing in that year fifteen per cent. of the total. In 1910 the amount used was only two per cent. of the total, due chiefly to the closing of one large plant. The average value of pulpwood in 1910 was six dollars per cord, and Quebec was the one province in which the price was less in 1910 than in 1909. The price in this province fell off thirty-five cents to five dollars and a half per cord. The highest price paid was in Ontario where it averaged seven dollars, while pulpwood from Nova Scotia at four dollars and sixty cents per cord was the cheapest.

Laths in Canada

Despite the use of metal lath and patent methods of interior finish, wooden lath production amounted to 852,000,000 pieces, worth $1,943,000 in Canada during 1910. This information has been obtained from statistics compiled by the Dominion Forestry Branch which show that nearly 30,000,000 more laths were produced in 1910 than in the year before, but that owing to a decrease in the price per thousand, the total value of the industry was thirty-five thousand dollars less. Two-fifths of the total was cut in Ontario, which province increased its 1909 production by 57,000,000 or nearly twenty per cent. New Brunswick, the second province in importance, increased its proportion of the total from one-fifth to one-quarter by cutting sixty-two million more than last year. The production of laths in Quebec and British Columbia during 1910 was considerably more than in 1909, amounting with Ontario and New Brunswick to ninety-four per cent. of the total. The remaining five provinces cut smaller amounts, and with the exception of Alberta, each showed a decrease in the amount produced in 1909. The average price of laths in 1910 was $2.28 per thousand, or 16 cents less than in 1909. The price varied considerably between the different provinces, British Columbia laths being $1.66 per thousand while in Prince Edward Island the price was $2.67.

The issue of Spanish River Pulp & Paper preferred stock put onto the market by Charles Meredith & Co., is officially stated to have been a success, the whose issue having been subscribed for.

J. R. Booth has turned down the offer of $13,000,000 by the Royal Securities Company of Montreal for the J. R. Booth lumber business.

The Corrugated Paper Company, Limited, of Toronto, has been incorporated with a capital of $40,000. The provisional directors are E. W. Owens, W. A. Proudfoot and H. J. Cooke, all of Toronto.

Rolphe Forget, president of the Richelieu & Ontario Navigation Company, stated recently that his company was negotiating for the purchase of the Collingwood Shipbuilding Company's plant at Collingwood, Ont.

It is stated that Mr. John C. Eaton, president of the T. Eaton Company, Toronto, who own and operate a large departmental store, is behind the company who intend erecting a $1,000,000 pulp and paper mill at Thorold, Ontario.

On December 1st fire completely destroyed the big dry kilns of the plant of the Kenen Woodenware Company, of Owen Sound, Ont. The fire is supposed to have been started by tramps. Loss $15,000, partly covered by insurance.

A. B. Gordon and William B. Russell, of Toronto, who own 15,000 acres of timber on Sechelt peninsula, B.C., contemplate engaging in logging operations on a large scale. The timber is mostly fir. They are on a trip to the limits to locate camps, etc.

The incorporation is announced of the Regal Flour Mills, Ltd., St. Thomas, Ont., with a capital of $500,000 to deal in cement, lumber, timber, shingles, etc. Incorporators, Edgar A. Smith. W. L. Wickett and Alfred M. Hutchinson, all of St. Thomas.

Mr. G. P. Grant, Toronto, a director of the Spanish River Pulp and Paper Company, stated that the plant and mills of this concern are suitably situated for the manufacture of paper. The paper mill now nearing completion will have a capacity of 1,000 tons of news paper a day which may be increased when the demand for the product warrants such a step. Mr. Grant claims that this company has the finest pulp wood limits in Canada, amounting to some 6,000 square miles.

The Muskoka Wood Manufacturing Company, Limited, Huntsville, Ont., have purchased and are at present installing a 40 horse power portable mill at Axe Lake in the Township of Monteith, Parry Sound district. With this mill they intend to cut hardwood during the winter season. The lumber will be delivered at Bear Lake Station on the Canada Atlantic. The mill has a hardwood capacity of 10,000 feet a day. Walter Hanes will have charge of the mill at Axe Lake with head office at Huntsville.

Messrs. E. W. Bonfield and J. B. Beveride, the vice-president of the Dryden Timber & Power Company, Dryden, Ont., who were in Toronto recently, to meet representatives of pulp mill machinery manufacturers, are reported to have distributed orders for the bulk of the internal equipment for the Dryden pulp mill. A significant arrival at the office of the pulp mill is J. C. Armstrong, Toronto, who is arranging for the installation of the power plant. He has been joined by C. A. Jacobson, also of Toronto.

Navigation on the Rideau canal closed November 30. Shipping by rail is quiet in the Ottawa valley. The car shortage problem which has troubled lumbermen to some extent the last few seasons will be simplified considerably by next season through the Canadian Pacific railway's ordering 1,200 additional freight cars. The E. B. Eddy Company, J. R. Booth and the James MacLaren Company, are using more cars than ever. December was ushered in with heavy snow falls which will help road making in the woods. Shanty operations are in full swing in all the limits and labor is in active demand for lumber camps.

Eastern Canada

It is reported from Montreal that the directors of Laurentide Limited have announced an increase in divident from 6 per cent. to 8 per cent. per annum.

A. D. Martin & Son, sash and door manufacturers of Magog, Que., are reported to have dissolved. S. A. Martin and Hubert S. Wallace will carry on the business.

It is stated that the new mills of Price Brothers & Company, at Kenogami, Que., will be completed by the end of the year, and that the company will be manufacturing pulp by May next.

S. A. Sabbatton, assistant manager of the Laurentide Co., Montreal, has received an appointment on the Board of that company to fill the vacancy caused by the death of Chas. S. Smith.

Stanley Douglas, Fredericton, N. B., has purchased for about $10,000 what is known as the Fleetwood block, an extensive timber property near the village of Stanley. The property contains about three thousand acres of valuable timber, both hard and soft wood.

Word comes from Woodstock that Gibson Bros., Northampton, have sold out their valuable lumber properties to a joint stock company, of which Hon. J. H. Fleming, Chas. Roger, John Gibson, Gordon Neal, and M. L. Hayward are members. The mill and water power rights are also included.

The statement is made that the public offering of the Spanish River Pulp and Paper Company's stock will be largely over-subscribed. The public have become familiar with the large earnings of pulp and paper companies in Canada and were prepared to subscribe for stock in this company as soon as the opportunity was afforded them.

Four men, Boullaine, Tremblay and Gauthier brothers, who were contractors for the Wayagamack Pulp and Paper Company, which company is erecting a large plant at Baptist Island, Que., were drowned last month-end in the St. Maurice River. They were out in a small bark canoe, which was struck by floating ice and cut in two.

An important property transfer involving the sale of 30,000 acres of valuable timber lands has just been closed. and a U. S. syndicate composed of Perry Black, Edgar Fillmore and L. J. Soy are now owners of the Hill lumber areas near Truro. There are at present five mills on the property, and the new owners expect to build two more this winter. It is expected that 6,000,000 feet of lumber will be cut before spring.

A Fredericton report announces that Arthur H., J. Gordon Joseph A., Frank J. and Mrs. Alice H. Likely, of St. John, N. B., have applied for letters of incorporation under the name of "Joseph A. Likely, Limited," to carry on a general lumber business with headquarters at St. John. The capital stock of the firm will amount to $49,000.

The Department of Lands and Forests of Quebec has issued a pamphlet descriptive of water powers to be offered at public auction at Quebec on May 14, 1912. Fifteen powers are included in the list, the possible theoretical power varying from 130 to 14,000 h.p., and the minimum power to be developed and paid for from 65 to 7,000 h.p.

Messrs. R. F. Atkinson, A. W. Gilroy, D. R. Lamy, J. R. Douglass and J. C. Purdy, all of Amherst, N.S., who have been carrying on an extensive lumber business, known as the Salmon River Lumber Company, with head office at Truro, have bought the lumber properties of the Anthony Lumber Company, Springhill Lumber Company and the Beaver Lumber Company. Messrs. R. B. Atkinson and A. W. Gilroy are managers of this new concern which will be known as the Atlantic Lumber Company, with headquarters in Truro.

In a telegram to W. B. Snowball, Mr. Harling, of Montreal, who is negotiating the sale of the Miramichi Pulp and Paper Company's property here, states that the report of Carl Riordon and Charles Read, who examined the plant of Sir John Milbanke, of England, has been received on the other side and is now being carefully considered by the people interested. It is not known whether the question is one of buying the pulp mill alone or of also entering into negotiations for the purchase of the big Snowball plant as well and running the two industries as one.

Dispatches from New Brunswick show that the revenue for that province so far as it pertains to stumpage dues, etc., has been increasing rapidly. The territorial revenue for the fiscal year ended October 21 amounted to $529,829, as against $495.000 last year; stumpage collections alone amounted to $367,641. While the stumpage revenue has increased it is collected on the same cut of timber as in 1907. Lumbermen in that province still contend that the cut for the coming year will be greatly curtailed owing to the poor demand for lumber and to the fact that a considerable portion of last season's cut is still tied up in the rivers as a result of low water.

The Dominion Mahogany & Veneer Company, Limited, is about to erect a factory at Lachine, just outside of Montreal. The logs will be imported from Africa and the Southern States of America and manufactured into veneer. This will be the only factory of its kind in the Dominion, and will make about the sixth on the North American Continent. Hitherto veneer of this description has been, for the most part, imported into Canada from the United States, but the company expect to secure a large portion of the business and to make Montreal the centre of this branch of the hardwood trade. The factory will be a two-storey building of reinforced concrete, and will cost in the neighborhood of $75,000. It will be equipped with all the latest machinery. Local capitalists are interested in the project.

Western Canada

A new Vancouver concern is the Hillman Lumber Company, Limited, incorporated with a capital of $10,000.

The South Vancouver Lumber Company, Limited, 615 Pender street west, Vancouver, has been incorporated with a capital of $50,000, to carry on business as timber merchants, sawmill owners and lumbermen.

The Canadian Puget Sound Lumber Company have secured a second order of two million feet of British Columbia lumber for Australia. Mr. D. Hankin, manager of the company, states that the shipment will be made in February.

The Canadian Pacific Railway announces that the British Admiralty recently placed an order for 200.000 feet of Canadian white spruce to be used in the manufacture of cars. This will be procured in the Queen Charlotte Islands, off the coast of British Columbia.

Fire recently destroyed the one-storey frame, tin-roofed shingle mill at 618 Montreal street, Victoria, B.C.. occupied by the Bulman Lumber Company, Limited. The loss is placed at $1,000 on the mill building, which was practically destroyed; $1,500 on machinery and $500 on contents.

Mr. W. A. Austie, secretary of the Mountain Lumber Manufacturers' Association, who makes his headquarters at Calgary, has sent a telegram to A. S. Goodeve, member for Kootenay, emphatically denying the statement made in the House of Commons recently by W. E. Knowles, member for Moose Jaw, to the effect that a combine existed among the mountain lumbermen, and stating that the association would welcome investigation into the whole conditions of the lumber business in the interior of British Columbia by an independent commission.

Spruce clapboards are being manufactured in Vancouver for the eastern market. Joseph Roderick & Son, wholesale lumber merchants, have leased the clapboard plant of the Imperial Shingle Company on False Creek and are manufacturing for shipment to the East. Up to the present little spruce has been sawn locally, the timber principally used being fir and cedar, with very little hemlock. There is a great abundance of spruce on all parts of the Coast, some very fine timber of this kind being in the North. Spruce clapboards find a ready demand in the eastern market.

The Canadian Puget Sound Lumber Company, Victoria, B. C., will build an addition to their plant at a cost of $40,000. Since the Canadian Puget Sound Company took over the affairs of the Michigan Pacific Lumber Company and the Michigan Puget Sound Company, extensive additions to the mill plants have been carried into effect. At the Victoria mill a new burner of the most up-to-date character is being completed at a cost of $25,000; a new dry-kiln of concrete construction to cost, when completed, about $10,000, is also about finished, and work has commenced upon a new three-storey door factory and storage building, to cost $12,000. In addition many minor improvements have been installed which, with the new office building contemplated, will call for an outlay of about $100,000. At the Jordan river plant of the company a like amount has been spent during the past year in the installation of new locomotives, donkey engines, trackage, and other necessary plant required to meet the enlarged operations of the company in that quarter.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

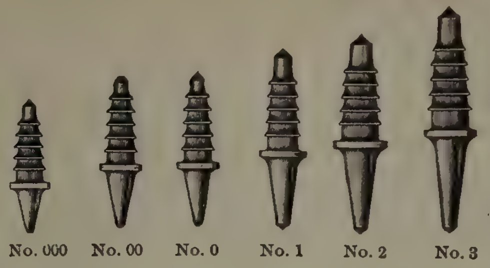
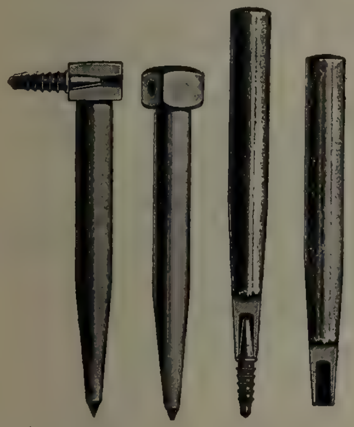
Improved Drive Calks



We have improved the shape over other Drive Calks, and as a result of careful investigation among *lumbermen*, and actual users of Calks, as to what was needed; we now offer you our *improved Drive Calks* which we guarantee not to work through the shoe and injure the foot or to work loose in a soft wet sole.

Our *Drive Calks* are made from the finest material that can be bought, are absolutely uniform in size and scientifically hardened.

Tools for Drive Calks



Lumbermen who have used these *calks*, claim they are the finest put on the market; in fact, we have such confidence in these *calks* that we guarantee them to users. Prices and samples on application.

CONSERVATION

NOT FOR SENTIMENT BUT FOR PROFIT

With the increased value of timber lands to-day, owners are beginning to realize the need and importance of systematically handling their lands. Forest holdings can be made to bring a financial return in a remarkably short length of time and for an indefinite period thereafter, by using our methods of mapping, estimating and surveying.

A Large Land Company's Opinion of Our Work

"Just the Information Wanted"

Samuel F. Hersey Land Company,
Bangor, Maine.
Branch Office, St. Paul, Minn.
St. Paul, Dec. 22, 1909.

Gentlemen,—

In reply to your inquiry of the 15th inst., we desire to say that the forestry work you did for us this year is entirely satisfactory to us. Your report and map were comprehensive and gave us just the information we wanted.

We shall undoubtedly call upon you again for further services of this character.

Very truly yours,
Samuel F. Hersey Land Co.,
D. A. Mudge, President.

Messrs. Appleton & Sewall,
Bangor, Maine.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts showing character and quantity of available timber, including the most approved methods of cutting each year so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

HOW MANY ? FT. PER MINUTE

Plain Facts

150, 250, even 500 feet per minute are claims you've had dinned in your ears for quite awhile.

The question of speed has been settled—was settled—three years ago when the American No. 77 came out.

No matcher on the market will turn out more lumber "profiled" or otherwise than the No. 77—*that fact the trade is familiar with.*

We have never made extravagant claims as to speed, because it's silly—the mill man is no fool. He knows how fast it is possible to handle the material. If he's quick at handling the stock, then, 200 or more feet on the No. 77 is no trick. We usually put into our ads 150 feet and upwards per minute—because the practical limit at which the average man can handle the material is not far above 150 feet.

There are hundreds of 77's in the country today to verify our claims and *that's the real test.*

Take the style siding shown here. It's perhaps the most difficult form of two-drop to cut. The No. 77 does it—is doing it—in mills all over the South at 150 and 200 feet per minute.

The No. 77 is a growth—fundamentally it's the same as it was three years ago; but the vigilance of the man who designed it is still upon it, and it stands today without a rival.

DISSTON

SAWS

ARE THE STANDARD BY WHICH

THE MERITS OF ALL OTHERS ARE

JUDGED

A SAW TO BE SUPERIOR IN EVERY RESPECT must be made of a steel of such peculiar quality and texture that will "take" the hardening and tempering to the greatest degree, giving the highest temper, retaining the necessary toughness and elasticity which admits of the springing of the points of the teeth in the setting and at the same time being so hard that it will maintain the set and cutting edge the longest time. The blade must be ground an even thickness on the entire tooth edge, properly tapered to a thin back for clearance and the teeth of such shape as to enter into and cut–not tear–the wood.

These are the Principles on which Disston Saws are Built

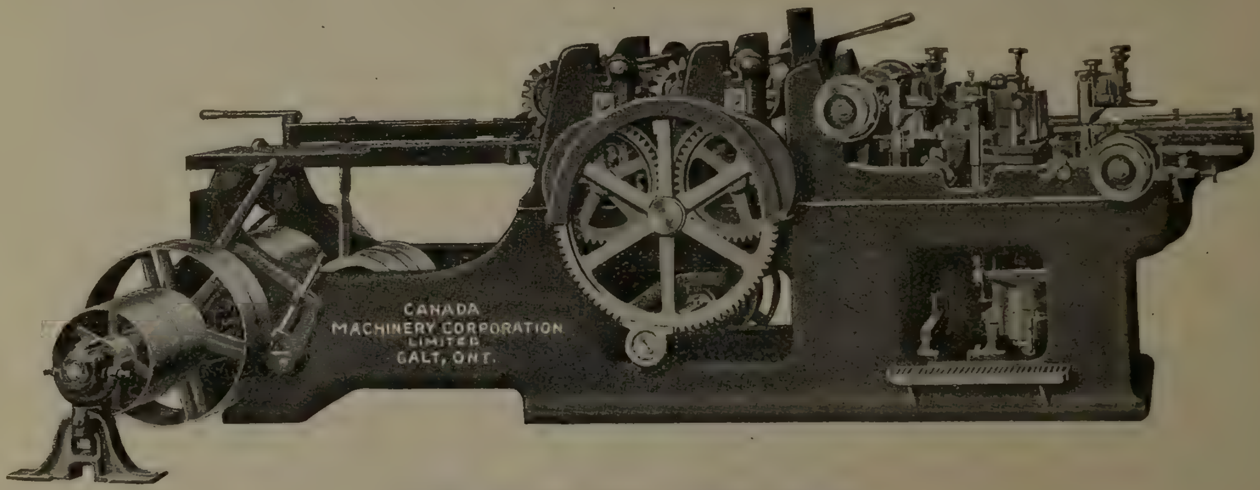
No. 300 Heavy Duty Inside Moulder

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.



No. 300 Heavy Duty Inside Moulder

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

The Positive Line
Power Transmission Appliances

There's a Copy for You

If you are interested in selling a line of power transmission appliances that has strong talking points, that has distinctive merit, that has unique individuality, that appeals to manufacturers because it embodies the perfection of modern principles of power distribution and control, or if you are a manufacturer and contemplate using any new power transmission equipment, you want this catalogue, "The **Positive** Line."

You can't afford not to investigate Positive Combined Jaw and Friction Clutches, Combination Split Pulleys, Shaft Hangers, Pillow Blocks, Compression Shaft Couplings, etc., if you want to handle or use the line that is so entirely different, better and far in advance of existing designs of such appliances, that it has revolutionized the transmission of power in manufacturing plants and has established a higher standard of dependability, durability, economy and efficiency in industrial operations.

The catalogue also contains some handy engineering tables and formulae. When you ask for it, don't fail to state, "Second edition of The **Positive** Line."

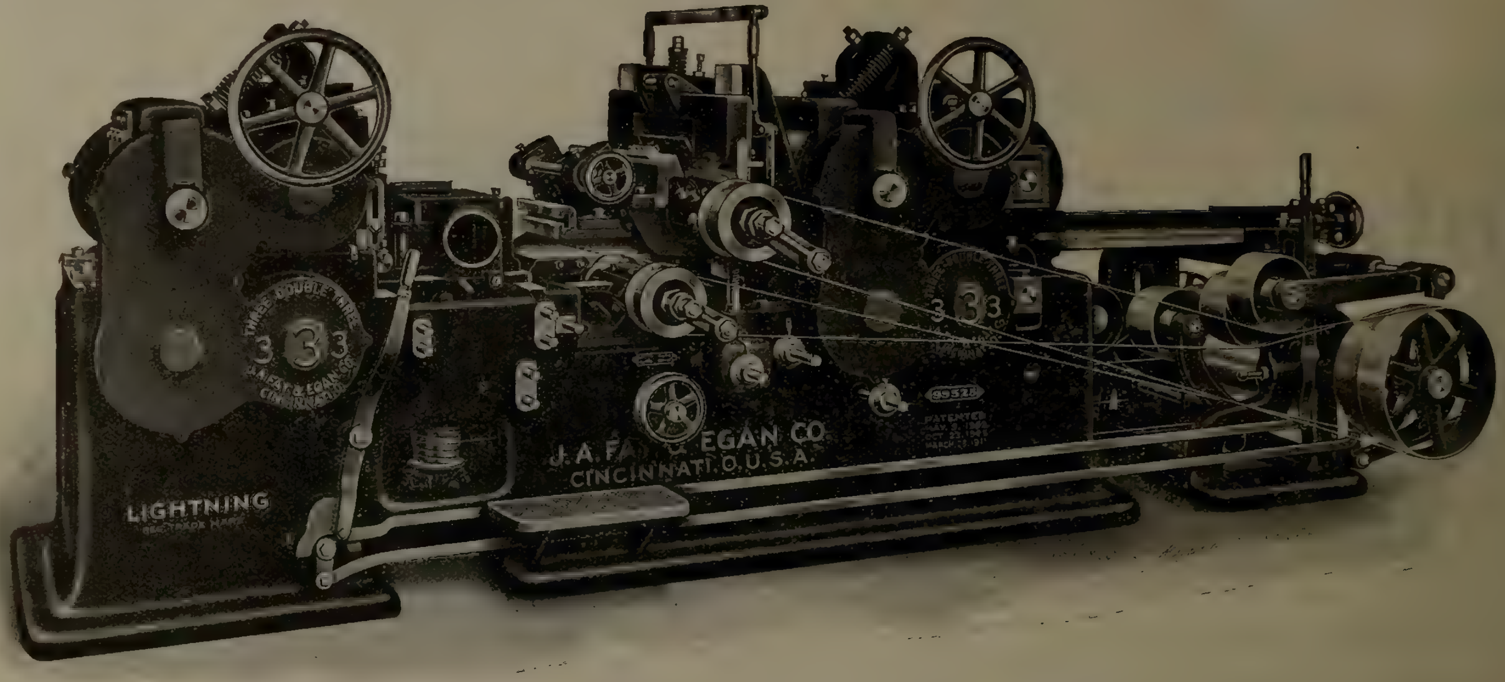
333 The new addition to the LIGHTNING LINE



NO. 333 "LIGHTNING" PATENTED PLANER AND MATCHER

The aim of the successful mill is to produce the highest grades possible at the lowest manufacturing costs. The mills that are achieving this aim are those using the new **FAY & EGAN No. 333 Planer and Matcher.** This new addition to the **"Lightning Line"** is at the least calculation 25 per cent. more efficient than anything here-to-fore attempted along this line. We can demonstrate this to you conclusively, ***first,*** by showing you the twenty-eight new and exclusive features embodied in this machine; ***second,*** by samples of work done, for instance, No. 117 siding made at 200 feet per minute, with profile attachment; it's smoother than any No. 117 ever made before at 100 to 150 feet per minute, and ***third,*** by the mills now using the new No. 333.

Write To-day—Now—for Details of the Newest and Most Efficient Fast-Feed Planer and Matcher—It's the Fay-Egan

INDUSTRIAL LOCOMOTIVES

Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

Twelve men *trying* to move an *empty* car

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.

"Polar Bear" Shoepacks

The only all oil-tanned, hand sewed, absolutely water-tight pack manufactured in Canada.

Todd's Meaford Special 17 in. Draw String Shoepack.

Arctic Storm King Child's Sporting. All sizes and lengths of legs.

We use nothing but oil-tanned leather in both leg and foot, no splits. We tan our own leather and our 20 years' reputation in the manufacture of oil-tanned stock stands back of every pair we put out.

Quick shipments our specialty. Our large factory, up-to-date appliances, good shipping facilities makes this possible. No order too large or none too small but that we can take care of on shortest notice.

We make shoepacks in any size or style from customer's order. Send for our price list

Solid and Inserted Tooth

Circular Saws

We make a specialty of these lines

We remake old Solid Tooth Saws into new Inserted Tooth Saws

Write to us for quotations

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper througout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

“John Bull”
Larrigans

Wear Like Iron

We tan the leather these larrigans are made from and know they will stand all kinds of wet and rough usage when properly cared for. We put a counter stiffener in our larrigans and sew it in with the leg when soled and heeled—a very durable feature in our goods.

Next time you buy larrigans see that you ask for **“John Bull.”**

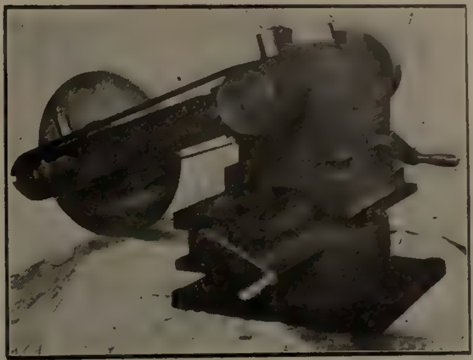
LINDSAY, Ontario

The “Midland” Band Wheel
Grinder



After this machine has been attached to the Frame of the mill it can be adjusted and put to work in twenty minutes.

One Setting Grinds Both Wheels.

The whole operation done before you can get enough timbers together to rig up any of the Grinders now on the market. Every Sawmill man knows that Band Wheels should be ground oftener than they are, but with the heretofore existing appliances this operation meant a shut-down for two or three days. With **THE MIDLAND** you can grind up at any time, and by keeping your wheels in shape make and save money.

Further particulars on request.

A Good Calk

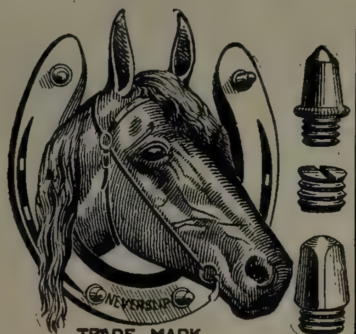
IS A SAFEGUARD,

A Poor One a Menace!

Get the Best

by insisting on the

RED TIP



TRADE MARK

BEST BY TEST

Calks that are made cheap to sell cheap, will act cheap. Just as a rotten rope makes a poor fire escape, so does an unreliable calk fail in its urpose.

The Red Tip Calk is the result of a combination of the best material, skilled workmanship, scientific methods and extreme care in inspection, The center of the calk is the highest carbon tool steel obtainable,—the outside of a proper degree of softness to insure self-sharpening without sacrificing length of service,—the thread absolutely correct. When all of these facts are assured beyond preadventure, by a final rigid examination, on goes the RED TIP, which is our O.K. and your guaranty.

Avoid substitutes. Look for the RED TIP.

32" — 2 saw edger for portable or light stationary mills

THIS edger combines more of the important points in the machine, than any other edger of its size on the market. It can be made to suit either a right or left hand mill, by taking out four bolts and turning the top of the machine around, which does not disturb the mandrel. The top rollers are self raising, and raise towards the rear of the machine. This makes it impossible for boards to fly back out of the machine. The end bearing may be removed, which allows the saws to slip off the end of the mandrel, without disturbing it in any way. There is a top roller, which is convenient for passing boards back over the top of machine.

FULL SPECIFICATIONS ON APPLICATION.
